OATS AND PEAS.—This is a favorite crop for soiling. Three different sowings have been made this year. This crop has been called a "ham sandwich for cows," for it seems to give just about the right balance in the ration for milk making. An experiment at the College farm showed that green oats and peas gave a complete ration, keeping up the milk flow of good quality. In feeding other soiling crops the aim is to combine them, so as to give a composition similar to that of oats and peas. This can be done by feeding green corn and grain, corn and clover or Alfalfa, and other combinations—thus saving the great space required for pasture, and part of the money spent for purchased grain. Oats and peas also make a milk of fine flavor and good creaming quality. Another good thing in its favor is the fact that the good qualities of the green crop are carried to the hay. Dried oats and peas make the finest of forage to feed with silage. In some sections the crop is permitted to mature, and the peas and oats are thrashed and ground into a coarse meal. Prof. Voorhees believes that the hay is better than the straw and grain separate. It has been asked how the oats and peas were sown. Last year's crop was on ground Fall-plowed. The seeding was done as early in the Spring as the ground could be worked. Two bushels of peas were broadcast over each acre, and worked in with a disk harrow. Then the oats were drilled in the usual way. The plan of harvesting for hay is to cut about one-third of the field, at one time, with a mowing machine. This is done in the afternoon. The next forenoon the hay is shaken up with a tedder, and in the afternoon put up in medium-sized cocks in which it stands for two or three days. It is then opened out for a few hours and hauled to the barn.

RYE AND WHEAT.—I told last week how these grains had been cut and fed out, so that the ground where they grew was being plowed for cow peas. Prof. Lane gave me the following statistics, which may be compared with the table printed last week. Year after year the crops seem to grow larger, so that there is more surplus left to be cured for dry fodder:

"The rye was sown October 3; fed May 1-21, and yielded 9.6 tons per acre. The wheat was sown September 26; fed May 21-28, and yielded 5.23 tons per acre. I might say in regard to the wheat that it was cut before it began to head, hence the yield was not large. Wheat might have been fed for a much longer period, but Crimson clover and Alfalfa came in at this time, so we had no further use for wheat. In regard to the yield of Crimson clover and Alfalfa, it is too early yet for records this season, so the best I can do is to give you some previous records. Crimson clover yields from six to 11 tons per acre depending upon the season, time of cutting, etc."

ALFALFA.—This is the prize crop at the Station. On May 28 the plants stood from 2½ to three feet high, as thick as a mat. The first cutting is about ready now—closely following the Crimson clover. As will be seen from last week's table the acre of Alfalfa gave green forage for 13 days, besides the second cutting, which was made into hay. This acre of Alfalfa was seeded May 14, 1898. One cutting was obtained that year. In 1899 the total yield was 20.21 tons of green fodder, or 5.05 tons of hay. Last year the yield was 26.60 tons of green fodder, which represented 6.65 tons of hay. Since the acre was seeded therefore—three years ago—it has produced 54.81 tons of green fodder, or 13.70 tons of hay, and it is now as thick and vigorous as ever. The Alfalfa is cut with a mower and fed green to the cattle. At first 30 pounds are given at a feeding, on the second day 40 pounds, and on the third day 50, which becomes the standard ration. The grain ration fed with this consisted of equal parts by weight of cornmeal, wheat bran and dried brewer's grains—six pounds per day being given.

ITS GRAIN VALUE.—The Alfalfa gives a heavy and bulky crop, but that is not the chief reason why it is so valuable for eastern dairymen. It is the "strongest" of the grasses—that is it contains more protein per ton, and produces more to the acre than any other hay or fodder crop. We must understand that "protein" is the most valuable element in all feeds—the part which is used to produce lean meat or fiber. Prof. Voorhees has worked this matter out with great care, and the following tables show the vast possibilities of an acre of Alfalfa as a grain bin:

Total yield per acre in pounds:

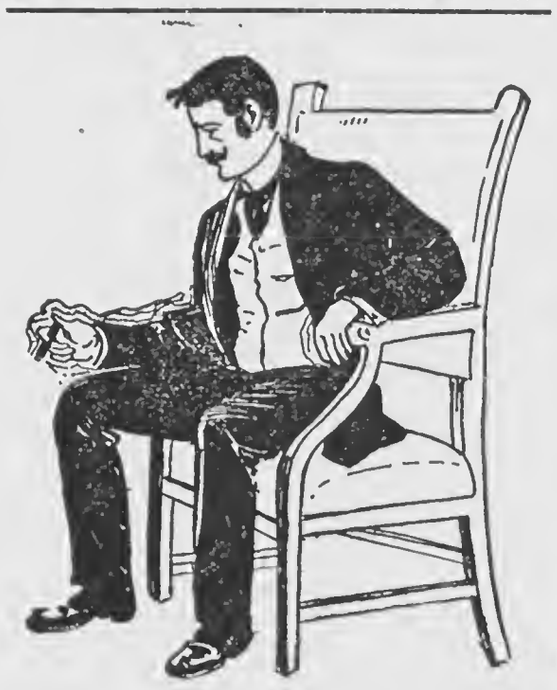
	Green.	Protein.
Alfalfa	36,540	2,214
Corn (entire plant)	24,000	408
Red clover	14,000	616
Barnyard millet	16,000	384
Crimson clover	14,000	434
Cow peas	16,000	384
Oats and peas	14,000	363

Total protein content, pounds:

1 ton Alfalfa hay contains	265
1 " Red clover hay contains	246
1 " oats and peas contains	175
1 " Timothy contains	118
1 " wheat bran contains	308
1 " wheat middlings contains	312
1 " rye bran contains	294
1 " oats contains	236
1 " rice meal contains	240
1 " buckwheat bran contains	248

Thus the acre of Alfalfa produces more than three times as much protein as an acre of Red clover, and will keep on doing it year after year without reseeding. Think of it—the acre of Alfalfa produces as much protein as one will buy in seven tons of wheat bran or 10 tons of oats! But is this protein worth as much in the Alfalfa as it is in the bran? A ton of big bones contain phosphoric acid, but who will say they are equal to a ton of fine bone meal? That is just the point which has been investigated at the New Jersey Station. I will try to tell about it next week.

H. W. C.



"A Bit Shaky."

A man looks at his trembling hands and says: "I feel a bit shaky this morning, and shall need a bracer." His real need is not nerve stimulant, but nerve strength. Dr. Pierce's Golden Medical Discovery gives strength to the nervous system. It does not brace up, but builds up. It is entirely free from alcohol and from opium, cocaine, and other narcotics usually found in so-called nerve medicines.

Accept no substitute for "Golden Medical Discovery." It cures.

David Duggins, Esq., of Jones, Ohio Co., Ky., writes: "When I began taking Dr. Pierce's Golden Medical Discovery I think I had nervous or general debility of three years' duration. I took three bottles of the 'Discovery.' During the time I was taking it my sleep became more refreshing and I gained fifteen pounds weight, and also gained strength every day."

Free. Dr. Pierce's Medical Adviser is sent *free* on receipt of stamps to pay cost of mailing *only*. Send 21 one-cent stamps for book bound in paper, or 31 stamps for cloth binding. Address Dr. R. V. Pierce, Buffalo, N. Y.

Live Stock and Dairy

A SURPRISE IN BREEDING.

The Hope Farm man recently said that he had two young Holstein heifers, full sisters, who were nevertheless developing into two quite different types of cows. One was doing what a heifer of a milking breed ought to do; growing into an animal with the incurved thighs and bony framework and generally undefined milky air which are the birthright of the cow born to the dairy. But the other heifer is building herself into a coarse, thick-hided, steer-like looking cow; just what she ought not to be. And from a theoretical standpoint this is strange enough. Unless we knew better from experience, we should say that two heifers born to one dam from one sire should be as alike as two hats made over one block. In general they would be very much alike, but Nature's rules, in the line of breeding at least, are subject to exceptions. One will have to do very little breeding to find that the unexpected often happens. Any man fortunate enough to have a family of children around his dinner table will not have to go abroad to find illustrations of the fact that brothers and sisters in mental and physical traits apparently differ from each other almost as much as they differ from the children in the next house. And what is true of children is just as true of puppies or pigs or calves. The truth is that breeding is very, very far from an exact science. We know that the sum of two and two is four. We may bring together two chemicals in solution in well-placed confidence as to what the precipitate will be. But when we mate two animals, we must be prepared for surprises, and sometimes for disappointments.

The inexplicable reason is this; that every plant or animal which comes into the world is subject to two fundamental laws of life. These two forces are inheritance and variation. No organism ever escaped them. Every one tends to resemble its parents and its far-off ancestry as well, and just as surely everyone tends to vary from its type, to exhibit traits not found in its ancestors. Such variation may be so marked as to be called a "sport" or a "monstrosity." And it is because we cannot with any certainty calculate in advance the relative influence of these forces, or the direction and extent of their action, that breeding has at best a good deal to do with the theory of probabilities. This does not mean that stock-breeding is after all a blind gamble on a happy chance. While it can never become a matter of mathematical certainty in results, yet men know that there are some causes which tend to increase the force of inheritance, and decrease the amount of variation. We know that the offspring of animals which have been long bred within certain blood lines—that is, old-established breeds—are much less likely to show wide variation than where the parents are mongrels. This is the practical benefit of breeds and stock association records. In our best and oldest breeds this tendency toward strong inheritance is pretty well established. The coupling of standard-bred horses will by no means always produce the phenomenal animal of the race tracks, but it will rarely fail to give a horse with the temperament and conformation of the trotter. As a matter of fact, the value of an animal for breeding is largely measured by its ability closely to reproduce itself. This is what we call prepotency, and in its highest form is always to be regarded as a most valuable character. For example, the famous old foundation Short-horn bull Hubback is said to have possessed a "touch," a mellowness of hide, which was incomparable, and which seemed to descend not only to his calves but to their descendants. In fact, the names which are famous in the history of any breed are those of animals which were able by virtue of their innate power to stamp their excellencies upon their descendants. Thus Stoke Pogis 3d, generally acknowledged to have been the greatest of Jersey bulls, almost invariably got calves capable of making more than 14 pounds of butter per week, regardless of the character of the dam.

So in general what is sought after by the breeder is strong inheritance. Yet it must be remembered that variation may also be most useful. Without this force improvement would be impossible. We should be able to breed an animal just as good as its progenitors but no better. While with good animals variations usually means a decline from the high standard already fixed, it may possibly mean a real advance over anything that has gone before. If such variation occurs it is fortunate if there is a master at hand wise enough to see it, and to secure its preservation. But just why these laws of inheritance and variation should act so differently in the case of these two sister calves is as impossible to tell as to account for the origin of life itself, a problem which Herbert Spencer frankly says "cannot be explained in chemico-physical terms," so that the great philosopher of evolution and the most simple-minded man finally reach the same conclusion.

JARED VAN WAGENEN, JR.

R. N.-Y.—The heifers referred to are out of a Jersey cow by a Holstein bull. They are full sisters, but very different in type.

Simple Tests for Oleo.

The Department of Agriculture is soon to issue a bulletin on "Household Tests" which will enable one to detect oleo or "devilled" butter readily.

Two household tests are given—the boiling test and the Waterhouse test. The former has been in use for about 10 years, and was originally used for the detection of oleomargarine, but after the advent of renovated butter the test was found to serve almost equally well in distinguishing this product from genuine butter, although not from oleomargarine. It may be conducted in the kitchen as follows: Take a piece of the sample about the size of a chestnut, put it in an ordinary tablespoon and hold it over the flame of a kerosene lamp, turned low, with chimney off. Hasten the process of melting by stirring with a splinter of wood; then increase the heat and bring it to as brisk a boil as possible. After the boiling has begun, stir the contents of the spoon thoroughly, not neglecting the outer edges, two or three times at intervals during the boiling—always shortly before the boiling ceases. A gas flame, if available, can be more conveniently used. Oleomargarine and renovated butter boil noisily, sputtering (more or less) like a mixture of grease and water when boiled, and produce no foam, or but very little. Renovated butter usually produces a very small amount. Genuine butter boils usually with less noise and produces an abundance of foam. The difference in regard to foam is very marked as a rule.

The Waterhouse test, designed a year or so ago by Mr. C. H. Waterhouse, at that time dairy instructor at the New Hampshire College of Agriculture and Mechanic Arts, is as follows: Half fill a 100 cc. beaker with sweet milk; heat nearly to boiling and add from five to 10 grams of butter or oleomargarine. Stir with a small rod, which is preferably of wood and about the size of a match, until the fat is melted. The beaker is then placed in cold water and the milk stirred until the temperature falls sufficiently for the fat to congeal. At this point the fat, if oleomargarine, can easily be collected together in one lump by means of the rod, while if butter, it will granulate and cannot be so collected. The distinction is very marked. The stirring is not, of necessity, continuous during the cooling, but it should be stirred as the fat is solidifying and for a short time before. The milk should be well mixed before being turned into the beaker, as otherwise cream may be turned from the top and contain so much butter fat that the test is vitiated for oleomargarine.

Short-horn Cows for Dairying.

The reply that W. M. Beninger makes to A. R. H. on page 176 is too misleading to be passed by without some correction. In showing cattle at fairs 10 weeks each year, as he states he has, I cannot guess what territory he covered that he did not meet with some of the dairy Short-horns. He must have kept clear of Bradford Co., Pa., for I know that they have animals there that any dairyman would feel proud of. First, you may take the herd of J. K. Innis, of Granville Center, who had some on exhibition at the Columbian Exposition. Two made records as follows: Kitty Clay 4th, 1592, 9 pounds milk and 62¼ pounds of butter; Kitty Clay 3d, 1230, 6 pounds milk and 50 1-6 pounds of butter. In a letter from Mr. Innis about two years ago he gave me records of some of his young stock that gave even greater promise than the two above mentioned; heifers that would milk up to the time of calving. At a little hamlet called Jillett you will find Aaron Jillett, with a herd that averages 300 pounds of butter per head a year, as he told me last Summer. He sold 10 animals of young stock, to go, I think, to Nebraska, for $1,000. Down around Burlington dairy Short-horns are quite numerous, yet the supply does not equal the demand, and it is difficult for breeders to procure sires to avoid inbreeding.

I have been using purebred sires for some time, have a few females and receive a good many calls for calves for breeding purposes; even a half-bred grade brings an extra price. I could sell many times the number that I have to spare each year. I know that in the West they have been breeding exclusively for beef, and every effort has been made to bring the animals to that point of excellence that they should surpass all other beef breeds as to quality of beef and in profit in making the same, but in the East it is different. There is a call for a general-purpose cow, and the effort being put forth with success on that line I believe that the Short-horn can be made more nearly to approach that point than any other breed.

CHILDS'
SO-BOS-SO
KILFLY

COWS Will GIVE FROM **15% TO 25% MORE MILK**

and Better Milk if Protected from Flies by the use of CHILD'S SO-BOS-SO KILFLY.

It is a thorough fly killer and germicide, it destroys all bacterial germs, insures health, greater strength and vigor to the animals and by the absolute relief afforded to them increases the amount of milk $8.00 to $10.00 per cow during the season you will find it the best investment you ever made.

It allays nervousness in horses as well as cows and keeps both in better general condition. As an antiseptic and for scours in calves, hog cholera, swine plague and foul in cattles' feet it is unequaled and may be used either in the stable, cow shed, chicken house or pig pen.

It is easily and rapidly applied with Childs' Electric Sprayer, and a herd of 30 to 50 cows can be sprayed in a few moments. SO-BOS-SO is absolutely harmless to man and beast.

Abortion in cows, which is caused by a germ—propagated by unsanitary conditions—can be prevented by the use of SO-BOS-SO KILFLY.

Sold only in gallon cans. Ask your dealer or send $2.00 for one gallon can and Electric Sprayer complete, securely packed and express paid to any point east of the Mississippi River except State of Maine.

The Sprayer can also be used for spraying potato vines, bushes, trees, etc. Beware of imitations.

CONVENIENT. CHEAP. PRACTICAL.

Thousands are in use in America, Canada and Mexico. Shipments have begun to Cuba, the Philippines, South America and Australia.

LENOX, Mass., April 21st, 1900.
I have used So-Bos-So Kilfly with good results. It is a comfort to both man and beast at the milking time. JACOB STEIBEL,
Supt. to the Hon. John E. Parsons.

PHILADELPHIA, PA., May 2, 1900.
Last July the daily quantity of milk produced by my Chester County Dairy fell off very considerably, which I attributed to the annoyance which the cattle received from the flies. About half the time the herd was standing in a stream switching instead of grazing. I ordered a sample of So-Bos-So Kilfly and by having it applied every second morning, greatly relieved the herd and increased the milk product from 15 to 25 per cent, and I have continued to use So-Bos-So Kilfly during hot weather ever since that time. Our herd of about twenty head could be sprayed in the stable in less time than it would require to milk a single cow, and I consider that I saved many times the cost of the So-Bos-So Kilfly used in addition to affording comfort to the herd. G. S. W. BRUBAKER.

LENOX, Mass., April 23, 1900.
We used So-Bos-So Kilfly last summer, on cows and horses with excellent results, it being much more satisfactory than anything else of the kind we have ever tried.
A. H. WINGETT, Supt. Allen Winden Farm.

CHAS. H. CHILDS & CO., Sole Mfrs., 12 LaFayette St., UTICA, N. Y.

AILING ANIMALS.

ANSWERS BY DR. F. L. KILBORNE.

Knee-Sprung Mare for Breeding

I have a mare eight years old that I would like to breed from. She is sprung in both front legs; would the colt be apt to be sprung also? R. E.
Cross Keys, N. J.

Her colts would probably be all right. If the trouble is congenital with the mare she would be more likely to transmit it to her colts than if the knees were sprung from overwork; but the danger of her having knee-sprung colts is very slight.

Tetanus in Colts.

My yearling colt died of tetanus within two weeks of castration, and a number of other colts in this neighborhood died under similar circumstances; all being castrated by the same veterinarian. Is it possible for a veterinarian to carry the germs of the disease from farm to farm? The veterinarian in question does not, so far as I know, sterilize his instruments. J. H. B.
Romeoville, Ill.

Yes, it is quite possible for a careless operator to carry the germ of tetanus, as well as of other diseases, on his person or instruments, if he does not observe due precautions as to cleanliness and disinfection. It is *inexcusable* for any person to perform an important operation like the castration of colts, without careful disinfection of instruments and hands. The animal ought also to be sponged off with a disinfectant before operating. An operator who will now castrate colts without disinfection ought to be held pecuniarily responsible for any injury or damage resulting from his neglect or failure to disinfect.

MORE CURES FOR KICKING COWS.

Take a strong strap long enough to go around the cow, just in front of the udder; buckle it around tight. It won't hurt the cow but it simply prevents her from raising her hind feet from the floor. As it seems to prevent her from using certain muscles she cannot kick, if the strap is quite tight coming in front of the udder and up around the flank. An old dairyman told me of this when I was trying to break some heifers. As heifers are always more or less nervous, this is a very mild and humane way of breaking them, and never fails when used on any animal.
Castorland, N. Y. W. S. G.

I meant to write to the Hope Farm man when it was first announced that he possessed a kicker. He, like many others (myself included), has formed a habit of commencing at the wrong end of a kicking cow. Procure a snap ring called a bull ring, put it in the cow's nose, and then tie the rope to a post or pulley or something lower than her nose, for when tied tight with her shoulders well up against the stanchion she is going to get on her knees to apologize for her heretofore unkind treatment, and usually will say it good and loud. In one case I had to chain back the hind leg for two milkings and affix the chain for two more. Nose ring cured the worst case within 10 days.
Pennsylvania. E. D. R.

I have been in your trouble with that kicking cow. I have had a good deal of experience with animals of that kind, some of them very vicious ones. It is no use to fight with a kicking cow; you will only make her worse. After trying many devices recommended, which proved failures, I adopted this simple and entirely effectual plan: Fasten a ring in the back of the stall, the cow's head fastened in the stanchions; pass a rope around the leg just above the ankle, tie it securely, pass the other end through the ring, draw it up snug and tie it. Sit down and milk your cow without any fear of her kicking, for she cannot kick without first bringing her foot forward, which she cannot do thus controlled. She will probably at first struggle and attempt to free herself. Be kind and gentle with her, and she will soon find you have control, and will yield and stand quietly while you are milking. Don't sell a good cow because she is a kicker. This simple device will prove effectual; at least it has always done so with me. B. A. B.
Armonk, N. Y.

The batch of "kicking cow" recipes are the most ridiculous rubbish ever offered to a dairy public, and I don't believe a practical cow man wrote one of those marvelous cures. You do not need a lot of breeching, hames, harness poles, bars, etc.; only a simple little piece of ¼-inch rope six or seven feet long. Make a loop in one end (so it can't shirr), put it around Julia very gently directly in front of the udder—in the flank—and up over the back just in front of the points of the hip bones, slip end of rope through your loop and shirr the rope up snug and fasten. That's all; now go on with the circus. Yes, she'll try to kick and if full of vim may possibly flounder just a bit, but she'll soon be the most disgusted cow on earth, and will stand quietly and chew her cud just as she does when the calves milk. I really do not suppose you care very much whether Julia is milked by hand or not, but it's worth knowing by any and all who milk cows, as the device is simple, practical, safe and sure. The drawing of the rope up snug around the cow does not in any way interfere with the natural "giving down" of the milk. Just try it and as the government seed packages say "report results."
Jerome, N. Y. G. C. W.

How to Pasture Hogs.

We never ring our hogs; as our farms are on the hills we let our hogs have large pastures to run in. When we started our pastures they contained a great many brakes or ferns. Our hogs will root these all up and eat the roots, and are killing them out. In the Fall, after the crops are harvested, we let them on our mowing. Some of the mowing is very rocky, and has never been plowed; then there are plots where we have taken the rocks off, and seeded down. We find that the hogs will never root the newly-seeded places, but will work the old mowing thoroughly, and after they have rooted them well over they come into clover. Now, when we turn the hogs on to them, they will feed the clover down, but do not root the turf except under apple trees. We also notice that after the hogs have rooted around the tree the apples are not wormy on that tree the next season, and that the leaves have a deeper color, and the apples are better. I would advise every farmer to keep more hogs, and never ring them. Fence off a plot and let them root, and then seed it down and take another plot. It is surprising to see what the hogs will do for them. Get some good purebred hogs, as it does not cost any more to raise them after one gets started, than it does to raise a grade, and there is a satisfaction in looking at a good uniform herd. As to breed, should advise selecting what the raiser thinks he would like the best, as anyone will be likely to have better success with what he takes a fancy to than with something he is not so interested in. BRADLEY C. NEWELL.
Rowe, Mass.

Trouble With Pigeons.

We have pigeons well situated in a good loft, tended well, and are at a loss to know why they leave their nests. They fly at large, leaving their nests while hatching. They are fed well. I. D.
Taylorsburg, O.

The trouble may come from too many pigeons for size of loft or number of nests, too many like for number of pigeons, or a few particularly quarrelsome birds that are continually fighting other birds from the nests. Pigeons differ in nature in much the same way as people. In the case of the pugnacious pigeons they should be removed from the loft. Unfortunately people of the same nature are not so conveniently taken care of. One pair of pigeons will sometimes take possession of several nest boxes, or the greater part of a loft, and possession and the ability to hold out against all comers is the whole thing with pigeons. This will happen more frequently with birds that fly at large than with those confined in an aviary. If the trouble is lice give them tobacco stems to nest with and they will soon disappear, as lice and tobacco stems will not occupy the same nest, and I know of no better use to which to put tobacco. Pigeons will usually give better results as a whole if confined in an aviary, properly cared for, than if allowed to fly at large. J. E. S.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2682. NEW YORK, JUNE 22, 1901. $1 PER YEAR.

ASPARAGUS IN NEW JERSEY.

AMONG THE MONMOUTH COUNTY GROWERS.

Rust-Resisting Varieties Needed.

LOW CROP, HIGH PRICES.—Asparagus is a very hardy plant, and will endure much frost when dormant, but it will not grow fast in chilly weather. The cold wet Spring has delayed growth from roots already weakened by attacks of rust last Fall and the result is a shortage of the crop, estimated at nearly one-half of the average cut up to the end of May, among the Monmouth Co., N. J., growers. Prices have been quite satisfactory, however, some of the fancy lots bringing the extreme figures of $6 to $7.50 per dozen bunches of 2½ pounds weight; good prime green and white bringing $3 to $4, and smaller grades $2 to $2.50. The concensus of opinion among experienced growers is that asparagus still pays the careful grower who has suitable soil and facilities better than any similar product, and a larger acreage has been planted this Spring despite the bugbear of rust, than for many years. Reliance is placed on high feeding, very thorough cultivation, a shorter season of cutting, and the selection of resistant varieties.

THE VARIETIES.—Conover's Colossal, which originated in this county a generation ago, is very thoroughly discredited since the coming of the rust, as it proves a ready victim, the tops browning early in August. No asparagus is more productive under ordinary conditions, but it also has a tendency to throw up many small shoots instead of the large solitary sprouts so desired by shippers of prime qualities. The Palmetto has proven most resistant of all, with the possible exception of the French Argenteuil, and nearly 70 acres have just been planted in these varieties, the only exception being a single trial of Donald's Elmira, which is thought to have some of the characteristics of Palmetto. W. B. Conover and F. S. Hendrickson, of Middletown, the former representing a planting of 50 acres or more, have set all their new ground to Palmetto, while Edwin Beekman, also an extensive grower, pins his faith to the Argenteuil. Mr. Beekman's experience with the Argenteuil goes back 17 years. He has imported the French seed by the hundredweight, and thinks it the most vigorous and highly developed variety for his purpose. When heavily fertilized it makes an enormous growth, sending up shoots nearly two inches thick, but it will not tolerate neglect and give profitable cuttings. Mr. Beekman piloted the writer to one field, set last Spring with one-year crowns, where stalks seven feet high could be readily found. The shoots came up singly, and towered up like young pine trees. The soil was a sandy hillside, which had been cropped to exhaustion with corn and grain by former occupants, but good applications of stable manure and chemicals had brought it to a responsive condition for asparagus.

FIGHTING RUST.—The rust-resisting quality is thought to be due to a bloom covering the cuticle of the varieties mentioned, making the germination of the spores more uncertain. It is quite certain that well-fed plants of Palmetto and Argenteuil generally remain green and thrifty late in the Fall, long after the susceptible kinds have died off as far as top growth is concerned. Where these varieties appear to suffer severely from rust investigation shows that either starvation or excessively late cutting is at fault or, more likely, the affected plants are not true to name. Esculent asparagus is largely bisexual in character, and much cross-pollination takes place. The best commercial seeds produce a mixed progeny, as, until the advent of the rust and the discrimination of resistant varieties, it was not considered necessary to grow the seeds carefully. Mr. Beekman finds American-grown Argenteuil seed inferior to the imported for this reason. In the asparagus districts of France practically no other kind is grown, and the seeds are consequently reliable.

NEEDS OF THE PLANT.—The requirements of asparagus have been so carefully studied by growers that little difference of opinion remains. It is an herbaceous plant of the Lily family, with an almost unlimited capacity for storing vital energy in its capacious root system. Give it a warm, light soil and clean culture, and you can scarcely overfeed it with either manure or chemicals. The shortening of the growing season by the rust is, however, a serious matter, and if not controlled by the selection of varieties, the plants must be given a better chance than in the past to recuperate after cutting. Many fields were seen where cutting stopped the last week in May, instead of the old way of continuing until near July 4. The practice of cutting underground to secure white stems with only a tip of green continues in full force, as only such stalks are rated as "prime," and bring the best price. The growers acknowledge better returns in proportion than usual from the culls and green stalks, and an examination of market reports shows much better quotations for green asparagus than for many years past. When the consuming public really learns the difference there will doubtless be an enormous increase in the demand for good green asparagus rather than the hard white stalks.

These Jersey growers do not take much stock in the idea of fighting the rust by means of fungicides. It is hard to get Bordeaux Mixture to adhere to the smooth stems or to cover the finely-divided foliage. The large growers would not stick at the cost of such huge machines as have been developed by the Long Island Experiment Station, which cost about $300, if they could be convinced of their practical efficiency in killing spores and prolonging the growing season of the plant. It takes a large quantity of spraying solution and much power to cover such a mass of vegetation as is represented by an acre of asparagus, averaging five or six feet high when in full growth. Mr. Conover informed me that rust appeared earlier on fields of the Conover variety where cutting ceased earliest, so that the growing season was not much lengthened by shortening the cutting season, but evidently less of the stored energy of the preceding year's growth was consumed. Other growers did not report the same experience. In their view the fields cut least held out best, and responded more energetically the next year. It has become a question whether it may not be possible to lay by weakened fields and only cut alternate years, but all agree that a better price must be obtained for the product to warrant two years' culture for each crop. W. V. F.

HYBRID AQUILEGIAS. FIG. 180. SEE RURALISMS, PAGE 438.

The annual strawberry meeting of the Lorain County (Ohio) Horticultural Society was held at the residence of G. N. Caruthers, near Oberlin, June 14. Strawberry culture was discussed in all its branches.

SELLING CHICKS FROM THE INCUBATOR.

How Shipped? How Sold? How Much?

Poultrymen report considerable trade in little chicks just out of the incubator. Some buyers prefer to pay more for the live chicks rather than run the risk of infertile eggs. The following notes are written by practical breeders:

Selling little chicks right from the incubator is practiced but very little, if any. We have made such sales a few times to near-by points at 25 cents each, from nice well-mated purebred stock. Can be shipped in baskets well protected and not containing too large a number. KNAPP BROS.

Fabius, N. Y.

I have never catered to the trade in young chicks, although I have sold several lots. I securely tied them in baskets lined with woolen goods and covered, sending them on specified trains. There is quite a demand for them, and for chicks three months old, but very few wish to pay much for them. Chicks two days old I consider worth from 15 to 50 cents each, according to value of parents and how mated.

Pottstown, Pa. W. W. KULP.

We have had some experience in that line, but not very extensively, and we would not advocate it, as there is much danger in shipping the chicks at a very great distance, especially in the early part of the season. What we have sold we crate in box with tin can placed in middle of crate, filled with hot water. We should have to have about $5 per dozen for little chicks, or $15 per hundred, if we were going to make a practice of shipping in that way. I do not think it is a custom that will be followed very extensively, as I think it would cause dissatisfaction with customers, as the chicks are liable to chills in transportation and die in customers' hands from the lack of proper brooding. In a great many cases people would try to raise them without much heat, and little chicks *must have* a temperature of about 90 degrees for some time. I think it much better for customers as well as the breeder that the customer buy the eggs and hatch them himself. L. O. TURNER.

Wick, O.

The shipping of young chicks is a new venture in the poultry business; very few are yet offering chicks from the incubator. Two or three are advertising chicks just hatched at $10 per 100, which is a fair price to the buyer and to the operators of machines. Others advertise them two weeks old at $25 per 100, which is very reasonable for chicks from first-class stock. I think that eventually very few eggs will be sold for hatching; that the demand will be for chicks just hatched. There is getting to be so much dissatisfaction in selling eggs that poultrymen are discouraged with the egg business. Next year we shall sell no eggs for hatching at all. When taken from the incubator and put in a lined box, with a hover in Winter or early Spring, the chicks can be shipped almost any distance without food, and will arrive in good condition. After arrival they should be taken out and put in a brooder warmed up to about 90 degrees, and then fed and watered, and with proper food and care 85 per cent should live.

Trenton, N. J. PLANET POULTRY FARM.

The plan of selling chicks right from the incubator is not a general practice, but is certainly increasing. It appears to be satisfactory for the most part. Ten cents is ordinarily charged for common chicks, and they are usually shipped in light boxes or baskets well lined and properly covered. This is also a very common practice in England, if I am rightly informed. The chief danger comes, I suppose, from the liability of our weather to extremes of temperature. I have often thought that eventually large incubator plants would be established in different districts, where the eggs would be handled by experts in such quantities as to warrant constant day and night attendants, and that after hatching, the chicks would be distributed throughout the district to farmers and farmers' wives who would rear the chickens. I think the brooder system will yet be developed, which will help to bring about this condition of the business. Certainly the poultry industry is bound to increase and to progress. It appears to me to be the most lively branch of agriculture carried on in America.

R. I. Exp. Station. A. A. BRIGHAM.

I sell the purebreds in small lots at 15 cents each, and in lots of 50 or less down to 25 at 12½ cents each, and in lots of 100 or more at $10 per 100. I use different plans of shipping in the different kinds of weather, whichever is best suited to conditions. To have buyers on the safe side I guarantee safe arrival, which I have but little trouble to do. This way seems to suit a good many people, as it saves them the bother of hatching, and also of buying poor eggs, which I am sorry to say a great many breeders send out, and then refuse to give their customers anything for their money if they do not get a hatch. In selling eggs for hatching I guarantee safe delivery and satisfaction; that means that if my customers do not get a good hatch I refill their order to their satisfaction, and I find I do more business that way than all of my advertising brings me. I am not expert enough to tell the roosters from the pullets while so young. All that is necessary for the buyer is to have a hen ready to take care of them, or have a brooder ready to put them in on arrival. I do not know how much it is practiced by poultry people generally, but imagine it will soon be overdone, as there will always be some one who will sell anything for the "best chickens." D. A. MOUNT.

Jamesburg, N. J.

EVERYBODY'S GARDEN.

NEVER TOO LATE.—I suspect that there is many a farm, village and suburban home sadly lacking as to a vegetable supply. I suspect that there is many a vacant and unsightly spot around these homes which, notwithstanding the lateness of the season, might still be beautified and utilized for growing a generous supply of late-sown vegetables for Winter use. The following list, for which there is still ample time, will be found very useful in making up the Fall and Winter store of good things to which every farmer's family is richly entitled.

LETTUCE.—The Summer and Fall supply of lettuce is usually cut short by the persistent habit of the early sown, of running up to seed, so that the table is usually minus this delicacy quite early in the season. Select a moist and somewhat shaded spot, work the soil fine and mellow and make very rich with well rotted stable manure, or better still, soak the soil thoroughly with liquid cow manure. After two or three days rake well and sow the seed, not too thickly, and cover lightly. As the plants begin to

WELL LOADED FOR DINNER. FIG. 181.

grow, thin out for use, or transplanting, and the remaining ones as they get more room, will begin to head up nicely, and with plenty of water and good culture will give a supply indefinitely. Any surplus above home or market use will be profitable for poultry, especially if kept in confinement.

CELERY.—For the late crop the plants may be set up to the last of July, and ground previously used for the early sweet corn, early potatoes, peas or beans will do nicely. The ground should be thoroughly worked; but on account of the shallow feeding habit of the plants, five or six inches in depth is sufficient. Thoroughly rotted stable manure is considered by most growers to be the safest and best fertilizer, and should be used without stint. In transplanting, clip the tops and ends of the roots back and set firmly, five or six inches apart, in the row, and unless rain has recently fallen, watering out will be found helpful. If the blanching is done with boards, 30 inches between rows is sufficient, or even less if space is limited. If blanched with soil 3½ to four feet is not too much. The essentials of a large crop and fine crisp quality are rich soil, and abundant moisture, and if the rainfall is not sufficient then watering by some means must be resorted to. The smaller plants, or even larger ones, if set later, may be left in the ground until danger of too much frost. They may then be taken up and placed in a dark cellar, and if set closely together with the roots packed in wet sand, they will make considerable growth and blanch nicely, and the larger stalks may be broken out as desired for use.

ENDIVE.—The late sown is highly prized in many localities as a Winter salad. The seed may be sown in drills as late as July, and when plants are well established should be thinned to 10 or 12 inches in the row. Clean culture is all that is necessary until late Fall, or when wanted for use; the outer leaves are drawn up and tied over the center of the plant, when they will blanch nicely in a few days' time. The Green Curled is a hardy and desirable variety, and blanches to a clear white. J. E. MORSE.

Michigan.

HOW AND WHAT NEW YORKERS EAT.

Farmers hear much about the great markets of New York. The city is a wonderful place. One can buy anything here at any time. The thing that is of most interest to the farmer is the great stomach of the city. In Greater New York and the cities of Newark and Jersey City there were last June 3,875,705 human beings. Probably not over five per cent of these millions contribute anything to the food supply. They are all consumers, eating food which is brought from the very corners of the earth. The farmer is deeply interested in the fact that these 4,000,000 human stomachs should be filled three times each day for 365 days in the year. It is easy to see how agriculture is affected when for any reason these stomachs go empty, or are filled with adulterated or improper food. We hope to give during the Summer a series of articles describing some of the odd and striking things about "city folks at their mangers." They will show country people something of what becomes of the food they produce, and also how their "raw material" is raised in price before it reaches the mouths of consumers.

Our little picture, Fig. 181, shows a figure quite familiar to New Yorkers who visit the large manufacturing buildings at the noon hour. The building in which THE R. N.-Y. office is located has a population larger than that of many country townships. A test vote before the presidential election showed 383 votes. There were enough women, boys and girls to bring the working population of this one building to more than 600. With the wives and children at home it is safe to say that this building represented an industrial and home population of more than 2,000!

The workmen in this city do not all bring their dinners. The great majority of those who work at trades go out to the restaurants where a fair meal can be bought for 20 cents, or send out for a light lunch. The boy shown in the picture is a "printer's devil." He will serve as waiter for a dozen girls or men. In each hand he carries a stick with six hooks driven into it. Little pails partly filled with hot coffee are hung on these hooks, and in the tray hung about his neck he carries sandwiches and pieces of pie—usually wrapped in paper. Some of the lunch counter men have a special trade in goods of this class, and little time is required for filling the orders. The boy goes his rounds day after day, and acquires great skill in balancing his load. A farmer coming in from the field and sitting down to a hearty meal will hardly understand how a man or woman can contribute much energy or force on a diet of pie and coffee—yet thousands of the young people who do the quick, active work in printing offices, binderies, etc., seem to live largely on such food.

LIVE STOCK IN SPRAYED ORCHARDS.

I have never been able to get a definite case of stock poisoning where stock fed under sprayed trees. Once in a while I hear that such a thing has happened; but every attempt that I have made heretofore to trace up the report has failed. It has always landed on some one who heard that such a thing had happened; but either he could not remember where he heard it, or of whom he heard it. Several years ago Prof. A. J. Cook, of the Michigan Agricultural College, in reply to objections of this kind, grazed his horse under a tree thoroughly sprayed with Paris-green. No harm resulted, and so far as I am aware this is the only definite experiment that has ever been made in this direction.

[Prof.] JOHN B. SMITH

For a number of years I have had running in my large orchards sheep, swine and calves, and none of them has been injured, except in one instance where I lost a couple of sheep, and this came about after a dry time, when none of the poison was washed off the leaves, and the sheep reached up and ate the poisoned leaves. In all my experience I have never known of another case of injury of this kind, except where men have been careless and have either spilled or deluged the grass with the poison, when, of course, there would be danger. I have never felt safe in using acetate of lead mixture, for the reason that it does adhere to the leaves so much longer, and there is danger from this source. The case you refer to of stock being so poisoned has doubtless come from just such carelessness as mentioned above, or from the animals eating leaves that still had some of the poison on them. E. V. A.

Columbia Co., N. Y.

There have been a number of cases of supposed poisoning by Paris-green in sprayed orchards reported at farmers' institutes, and one or two by letter here at the Station. In every case I have endeavored to secure definite information, but have been unable to follow any of them up satisfactorily. The only case that has come under my observation which seems to be based upon definite information occurred last Summer near Rochester. I happened to be at a farm just north of the city when two or three of the cattle were taken sick. Two of them died within a few hours. A veterinarian was called, and he stated that the cattle died as a result of arsenical poisoning. They had been kept for several days in an orchard which had just been sprayed with Bordeaux Mixture and Paris-green. Branches of the trees were low enough for the cattle to reach them. The veterinarian was very positive that the trouble was caused by the Paris-green. On the other hand, I have known of a number of cases where sheep and cattle were kept in sprayed orchards with no apparent indications of injury.

Geneva (N. Y.) Station. [Prof.] V. H. LOWE.

AGRICULTURAL EDUCATION.

At an early age the thoughts of a boy begin to dwell upon his future occupation. Too often the boy on the farm begins to plan, long before he puts on long trousers, of going to the city or becoming a professional man. The boy from the farm may be found in the pulpit, behind the desk, in the bank, in the private office of the successful merchant, or on the street carrying the physician's medicine case. But times are changing. The farming profession, for such it is, is beginning to attract, and the farm boy is now content to take a course in an agricultural college instead of a technical or professional institute. A few weeks ago the Students' Agricultural Club of the North Dakota Agricultural College met the mechanical students of the same institution in debate on the following question:

Resolved, That a mechanical course is of more value to the average person than an agricultural course. The negative debaters corresponded with several of the leading colleges of the United States, which brought out some valuable points. It will be clearly seen by the following that 80 to 95 per cent of the students return to the farm to become independent. Of those who do not a position is waiting at good salary. Prof. I. P. Roberts, of Cornell Agricultural College, writes:

Fully 87 per cent of all of the students who have had instruction in the College of Agriculture here have gone back to the farm, and 85 per cent of the graduates. Comparatively few students take the four years' course, or remain to take a post graduate course. The salaries of those who do, and who have secured positions, range from $1,200 to $4,000 per year.

E. Davenport, professor of animal husbandry, Illinois College of Agriculture, writes:

Within the last two years our numbers have increased from 21 to 157, and with this new prominence given to our work have come many calls for young men to fill various positions in agriculture at various salaries. In one case I remember replying that we had no man that we could recommend for the place, and if we had he would be worth a professor's salary. The party replied by return mail that if we could find such a man as he wanted he would give him a salary at the beginning equal to any professor's salary in the University. This is somewhat unusual, of course, and still there are many calls, almost none of which we can fill, because our young men are nearly all expecting to serve themselves rather than others. I am therefore unable to give you very much information of value for your debate, excepting to say that this call for well-trained young men is sharp, and the opening extremely good, the consideration always being that a man can do a particular line of work and do it extremely well.

W. C. Latta, professor of agriculture of Indiana College of Agriculture, writes:

With any worthy young man, it is not a question, "In what line can I make the most money," but "What am I best fitted for by nature?" Having settled this point, the next thing is to seek preparation necessary to be in the highest degree successful in the chosen pursuit. The young man who chooses agricultural or mechanical pursuits for the sole reason that he may make or save more money thereby, has a very low ideal of his calling, and although he may secure his object, he must surely fail of the highest success of life. I believe, however, that with equal preparation and with equal application, the chances are in favor of the young man who takes up agricultural pursuits, from the money standpoint.

F. D. Tucker, of the Minnesota College of Agriculture, writes:

We have about 250 alumni, and I may say that 90 to 95 per cent of these have returned to the farm, many of them to their own farms. I do not think that any of them want for employment. I thoroughly believe that the man who is dealing with the soil and with developments that belong to farming has as large a field of opportunity as in any pursuit, at the present time.

Prof. R. A. Moore, of Wisconsin, writes that it will be well to remember that the short course of which he speaks consist of but 32 weeks' work, two Winters, and the creamery course but 16 weeks.

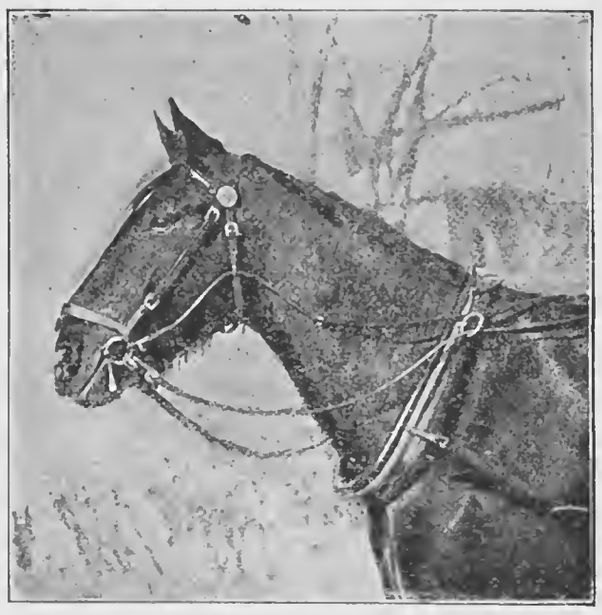
We are giving in the College of Agriculture at the present time four distinct courses, namely, graduate course in agriculture, long course in agriculture, short course in agriculture, and the factory course in butter and cheese making. We have at the present time 297 students in the short course, 120 in the factory course, 17 in the long course and one in the graduate course, or 435 all told. In regard to the short course I wish to state that farmers, dairymen, horticulturists and live-stock men now realize that the young men are being trained along their special lines of work, and within the past 10 days I have received at this office no less than 200 calls for the services of these young men, with wages ranging all the way from $20 to $75 per month, with board, washing, etc. We have an excellent lot of young men attending the short course; 101 in the second-year class, and 197 in the first-year class; the average age of our students for this year is 22 years. The students taking the factory course in butter and cheese making have no difficulty in securing positions as cheese makers and butter makers at from $30 to $75 per month. Of the 2,700 cheese factories and creameries in the State of Wisconsin, 600 were operated last year by students from this college.

Prof. Shepherd has on file in his office at this college calls for eight men at salaries ranging from $800 to $1,200 which he cannot supply. It seems that this ought to settle the question of the financial side of an agricultural education. E. A. CANNON.

North Dakota Ag'l College.

NOTES ON FARM MACHINERY.

CLEAN THE TOOLS.—Many times machinery works hard, does poor work, and gets out of repair simply from sheer neglect. Keep all nuts tight, and when using machinery keep your eyes on parts subject to most rattle and bang. A little watchfulness and turning up of a nut once in a while saves many a repair bill. We like to give all parts that come in contact with the earth a quick clean at close of day. A worn-out whisk broom and an old sack work well. When through with a machine for the season take it

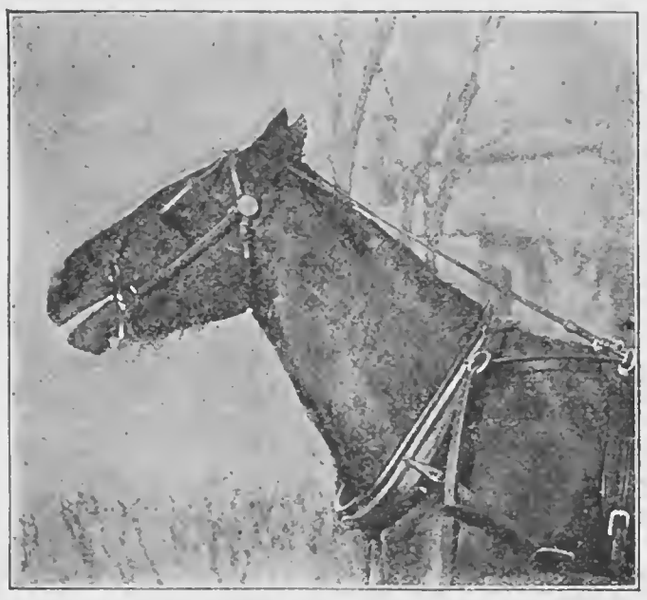


NATURAL AND COMFORTABLE. FIG. 182.

apart and give it a thorough cleaning the first rainy day. It will live longer. We have often found many points of value before unknown during this cleaning process. It pays to know all about the machine and to be able to locate trouble at once. It is surprising how many hard knocks among the rocks some of the modern machinery will stand, and do perfect work.

USE OIL.—The average hired man has an antipathy for an oil can, and will run a machine till its groans can be heard at a distance before he will look into the matter. He must be constantly reminded frequently to oil the machine, be it harrow, planter or reaper. When work crowds as it does at this season, and especially so this year, it pays better than ever to keep all tools well oiled. They work better, much easier on the team, and all hands, team and machine will last longer. Oil is not very expensive and a gallon goes quite a while. We formerly paid 40 to 60 cents per gallon when bought locally. We now buy by the barrel right from the producing region, and get the same grades that cost 40 to 60 cents for 12 to 18 cents. It pays to buy of the producer, and generally to sell to the consumer.

DEFECTS IN HARROWS.—The ordinary harrow makes us tired, for it doesn't do what it pretends. In a season like this, on good loam, or heavier soils for crops that need deep soil, it's worse than a failure;



STRAINED AND MISERABLE. FIG. 183.

it's a positive nuisance. Why? Well, try either the disk or spring-tooth, and it will pulverize the soil on top for an inch or two, hardly ever go much deeper. You may think so, but measure it. All the time you are harrowing the horses are packing down tighter than ever the soil under this loose top, and by the time you have the top in what you call nice condition it's about as hard as before plowing. The harrow will not go deep enough for potatoes, and we've been thoroughly disgusted with their work. It will often be better to wait until the ground is in *right* condition, then plow deep and run over once lightly with weeder or smoothing harrow. The soil then will be mellow clear to depth of furrow plowed.

USE OF WEEDER.—We meet some men who say the weeder is no good, but rightly used it is one of the great labor-saving tools. We use it after the Cutaway and spring-tooth harrow. Then if land is fairly good a vigorous use of the weeder once a week after planting will give the hoe a chance to get rusty. Too many wait until the ground is covered with weeds that have a strong root growth, and expect the weeder to take them out. It won't do it, but take them just as they are sprouting or pricking through the soil, and it will lay them bare to the sun, and a quick death ensues without the slower work of the cultivator or hand hoe. A weeder can be used soon after a rain, and it's surprising how some crops will jump ahead after using it just after a rain; air is admitted freely to the soil; no baking on top. This is the year to push the weeder. H. G. M.

Connecticut.

TORTURE OR COMFORT IN THE CHECK-REIN

The pictures shown at Figs. 182 and 183 are taken from an excellent leaflet issued by the Humane Education Committee at Providence, R. I. This committee is doing a noble work in calling attention to some of the ways in which our domestic animals are abused. A good deal of this abuse is thoughtless—that is, the owner or driver does not desire to torture the animal. He either does not know any better, or else does what others about him have been doing for years. There are many ways in which the tight, overdrawn check-rein annoys or injures the horse. The picture showing the wrong way of "checking" well illustrates the trouble. In fact, the pictures are a whole story in themselves. The leaflet mentioned makes a strong argument against the tight check, quoting some of the most noted breeders, drivers and horsemen against it. Here are two samples—the first from Wm. Pritchard, president of the Royal Veterinary College, London:

The continued pressure of the bit of the bearing-rein (check-rein) deadens the surrounding portion of the mouth with which it is in contact, thus producing a partially insensible condition of it—a condition most ill-suited to receive a sudden impression, as a check from the driver, in the event of the horse stumbling from any cause; I would therefore say that, instead of preventing horses from falling, the bearing-rein is calculated to render falling more frequent. Other not uncommon results of the use of this instrument of torture are distortion of the windpipe to such a degree as to impede the respiration ever afterwards, excoriation of the mouth and lips, paralysis of the muscles of the face, etc. Another writer says: "Tying one part of an animal's body to another does not necessarily keep him on his feet. It is the pull from the arm of the driver that makes the horse regain himself when he stumbles. One might as well say that tying a man's head back to a belt at his waist would prevent him from falling if he stumbled in a race."

USEFUL HAY TOOLS.

The hay tedder is considered by some an unnecessary tool except in seasons that are so "catchy" that hay must be made "between showers." Of course in favorable weather hand work will do the business, but those who have used a tedder find it such a convenience and labor-saver that they would not do without it. All farmers know what a job it is to get the water out of a lot of hay that has been caught in a hard shower and beaten into the stubble. A man who is always kicking makes a disagreeable associate, but it is a real joke to see the tedder kick around, pick up this wet hay and toss it in the air, until the wind and sun do away with the moisture. It is also a big help in drying heavy grass, which would otherwise have to be turned and stirred up several times with forks. The hay-loader is not so well-known in the East, and is not adapted to steep hillsides. In the West it is used on the heaviest of hay, including Alfalfa, peavine or sorghum hay. It is fastened to the rear of the wagon, which moves slowly, the motion working the loader so that it picks up the hay from the ground and carries it up to the load by an endless chain. In heavy hay a loader will keep two men on the load busy They are simple and durable machines, the better ones lasting as long as 20 years with reasonable care.

The side-delivery rake is a comparatively new machine, and an excellent tool. A small boy can run it, as the operator has nothing to do but drive. There is no dumping, the windrows being made lengthwise. It also catches the hay at an angle and is thus more likely to get it all. The hay is not packed together, and thus may be gathered up much sooner than with an ordinary rake, as it is left so loose that the air circulates through it freely. Of course this loose windrow is a disadvantage to the pitcher, more picking being required to get a forkful into shape, but a hay loader will take it all up. These side delivery rakes were really made to work with the loaders.

I have never had anything injured in orchard after spraying, and I know of no such case. Still, we are very careful about turning in sheep, cattle or horses, but hogs I never take out; have not had any injured.

Ontario Co., N. Y. T. B. WILSON.

Van Deman's Fruit Notes.

ALL SORTS OF QUESTIONS ANSWERED.

Wood Veneer Tree Protectors.

E. A. P., Chatham, Pa.—Where can I procure the wood veneer tree protectors referred to in THE R. N.-Y. for June 1? I have tried to find them at one or two large agricultural warehouses.

ANS.—The manufacturers of berry boxes can easily make, if they do not keep in stock, the wood veneer for protecting trees from rabbits and sunscald. Sheets 12 inches across and 18 inches lengthwise of the grain, and 1-16 inch thick, are about right. It would be a little safer to have them a little longer. The box manufacturers ought to advertise these sheets in lots of 1,000 each at cheap rates.

Currants Dropping Fruit.

C. S. R., So. Hingham, Mass.—What is wrong with my currants? I have the Wilder, Victoria and Red Cross, and they all drop their fruit as soon as it is formed. The bushes are very healthy and there are no worms or insects of any kind. There have been no injurious frosts. I am 13 years old and am much interested in fruit culture.

ANS.—As there have been no insects, frosts or fungus diseases (apparently) to injure these currant bushes it is impossible for me to give any reason for their failure to mature their fruit. It may be possible that some fungus affects the bloom or the young fruit, causing it to drop. A spraying of Bordeaux Mixture just as the buds are bursting next Spring and another soon after the flowers have been in bloom would do no harm and might prevent the trouble.

Dry Rot in Apples.

F. T. J., Drownville, R. I.—What is the cause of dry rot in apples and the remedy if any?

ANS.—Apple rots of all kinds are usually caused by the spores of fungus diseases germinating on the inside of the fruit and their "roots" or mycelium entering the skin and pulp and causing the death and decay of the cells, which we call rot. These rots are often quite soft, but sometimes they are rather dry. Spraying with Bordeaux Mixture usually prevents the trouble to a very considerable extent. The work should be done quite late—when the apples are more than half grown, and the ammoniacal solution of copper does not stick and discolor the fruit so much as the other mixture. The study of and remedial measures for these diseases on ripe or ripening fruit are as yet not well perfected.

Various Questions.

C. L. B., Trenton, Ala.—1. What is the best and earliest peach that will not rot before it gets ripe, or within 10 minutes after? 2. What is the best very late grape? 3. Is Campbell Early as good as Moore Early grape? 4. Can you tell me how to prepare seed potatoes for the second crop?

ANS.—1. Among the best of the very early peaches that is not especially subject to rot is the Triumph. It is a yellow peach of very fair size and quality, and seems to be good for either home or market purposes. Sneed is another variety that is considered by the southern growers to be very good. With all of the Hale type, such as Amsden and Alexander, one must usually be ready to eat them before the 10 minutes, as mentioned, have expired. 2. A very good late grape is McPike, which is large and black, and although new gives promise of being valuable. Ives begins to color very early, but is not ripe until late. It does not hang on the bunch very well, which is its worst fault. Catawba is also very late, but it is so subject to rot that Bordeaux Mixture is a necessity in its culture. In quality it is rarely equaled. 3. Campbell Early is better in size of berry and cluster, and in quality than Moore Early. The vine is about all that can be desired, and on the whole it is one of the very best, if not the best of the very early grapes. 4. To prepare early potatoes for planting the second crop they should be laid in a shady place, as under a tree, as soon as dug, and allowed to remain there until well "greened," which usually takes two weeks or more. They may then be covered with old dampened sacks or mats, and allowed to sprout a little before planting. They will usually grow well without the latter treatment.

THE CASH COST OF LIFE.

Experience of American Farmers.

We would like if possible to obtain reliable statistics regarding the household expenses of average farm families. In order to do this, we wish to obtain the facts from a large number of country people with reference to the money they spend for such items as clothing, groceries and meat. Will you tell us just what your bills will average for a year? In other words, what was your grocery bill, your clothing bill and your meat bill for the past 12 months?

The average expenses of my family of four members for a year are: Clothing, $240; groceries, $85; meat, $100. B. D. P.

New Jersey.

There are six in this family. Grocery bill, $60.00; clothing, $80; meat, $10; total, $150. W. H. S.

Connecticut.

Our family averages from three to five persons; our whole expense per year from $250 to $325. This includes taxes. For groceries, $55; meat, $15 to $20; clothing, $50 to $75. C. D. A.

As farmers we killed hogs for our meat. Our grocery bill would be $25 for about four months, and our clothing $15.50 for a family of two. We only kept account for four months. Through these four months we had some hired help also. R. H.

Michigan.

Family of eight persons, from September 1, 1899, to September 1, 1900. Groceries, $113.49; flour, $46.40; kerosene, $17.74; clothing, $127.78; meat, $70 paid to butcher, $80 slaughtered at home; total, $150; slaughtered at home, one two-year-old steer and three nine-months-old pigs, worth not less than the $80 marked. A. C.

Rhode Island.

There were four in our family during the year 1899, consisting of "the Madame," two children, Helen, 10 years old, and Mildred eight years old, and Grandma, 89 years old. Our household expenses, including groceries, postage stamps, wall paper, curtains, etc., were $53.49; "the Madame's" clothing, etc., $10.42; Helen's, $14.80; Mildred's, $8.65. Grandma was confined to her room and bed all the time, so did not require any new clothing. The rest of our living was from the farm. We burn our own wood.

Maine. E. H. C.

I cannot give exact figures except on groceries, of which we have kept strict account. Being farm people we raise our own beef, pork and poultry. I can give the amount consumed, the price by the side, and the retail price in town. Our family consists of four grown people all of the time, hired man nine months, and in the busy season two extra men two weeks. We will on an average consume 600 pounds of beef and pork during the year, which at retail here would cost 10 cents per pound, and by the side six cents. Our grocery bill for the year is $77.40, and for clothing at $20 each, $80. Of course the last figures are estimated. A. C. F.

Michigan.

Our family is made up of my husband and myself, one little boy of our own, eight years old, and a little boy from the Home, aged 11 years; a girl of 16 years from the Home, and a young man who works for us. We raise all our flour, most of our meat; only buy meat from market in the very hot weather. Our doctor's bill is large this last year, on account of a very serious case of scarlet fever; usually we have none, or at least a very small one. We have a great deal of fruit, and in picking time board the help, and so our grocery bill is sometimes larger, sometimes smaller. Grocery bill for 12 months, $63.44; doctor, $65; meat, $12.28; clothing, $109.64.

New York. F. W. C.

The following are our expenses for the past 12 months as near as I can give it. Our family consists of five, my wife, myself, two children and hired man: Meat, $8.40; groceries, $55.60; clothing, $41.16, not including hired man's clothes; total, $105.16. This does not include anything that was raised on the farm, nor a doctor's bill of $19.20. L. W. R.

Pennsylvania.

Cream Will Not Churn.

S. C., New Milford, Conn.—I have a Jersey cow three years old, a good milker, but I cannot make butter from her milk. The cream when churned looks like whipped cream, and when let stand for a while a quantity of very bitter whey settles at the bottom. The only way I can get butter is to churn, then let it stand, and draw off whey and repeat until I get all the whey off, which is a very tedious job. What is the cause; how can I remedy it?

ANS.—Probably you are not thoroughly ripening the cream, that is, the whole mass is not ripened uniformly. Churn at least twice a week. Twenty-four hours before churning mix together thoroughly all the cream to be churned and keep at a temperature of 70 degrees or a little below, depending upon the time of year, until sufficient lactic acid has developed; that is until it is sour enough. If after this the churning continues to be difficult use some one of the commercial starters, like Hansen's or Douglas's lactic ferment. Commercial starters are not very expensive, and full directions come with each package. J. A. F.

NOT MUCH STUFFING.—I appreciate THE R. N.-Y. very much; I think it has the least stuffing in it of any agricultural paper that I have seen. Tell the Hope Farm man to put his house tank in the top of his stock tank, so the water will overflow from it into the stock tank. This will keep the water fresh and cool. H. A. M'Q.

R. N.-Y.—You must remember that what seems mere stuffing to one man may be the real stuff to another.

THE MOTH TRAP.—I have read the story of the moth catcher and also editorial and my faith in the trap as a destroyer of orchard and farm pests is not shaken. I had eight of the traps in my garden and orchard, and caught 80 moths, eight stinging flies and a quantity of bugs in one night—the night of May 23, the only warm one we have had here this Spring. Give the moth catcher a chance and it will prove its ability to vanquish many, if not all, of the insect enemies of the fruit grower, and do not call it a humbug until it has been tried and proved to be one. G. Z. G.

Warsaw, N. Y.

R. N.-Y.—We do not object to the trap, but the way the maker garbles testimonials. How many of the "bugs" you caught were useful to the farmer?

JOTTINGS BY THE WAY.

Grange Meetings—Good and Bad.

The Grange as a State institution is a power in the land. The Grange as a local organization rarely lives up to its opportunities. In the State its interests are looked after by wideawake, energetic farmers, who are also business men. The local Grange often lacks these energizing souls, and suffers in consequence. During the past three months the writer has had exceptional opportunities of studying the strength and the weakness of this institution. This experience impresses him with the belief that the success of a Grange often hinges upon the unselfish actions and public spiritedness of one or two of its members. I have attended a number of meetings this Spring, some of these were special, others general. Some were melancholy failures, others heart-cheering successes. What contributed to the successes? What caused the failures?

A Successful Meeting.—Let us illustrate a success and a failure and perhaps we can guess at the underlying cause in each case. Here's one which took place in Genesee County a couple of months ago. The writer was asked to meet with a certain Grange. He acquiesced. On the appointed day he was met at the station and taken to the hall. Although the day was wet, fully 150 men and women were present. The first item was "a Grange luncheon." This was unique and enjoyable. Couples sat vis-a-vis. Board trays were placed on their knees and the serious business commenced. The young served the old. All were merry. It was an indoor picnic! After clearing up and dishwashing the other part of the programme was attacked with vigor. Music—by the audience—an address by the visitor, a question-box by the chairman, completed the afternoon's entertainment. The visitor went away feeling that he had had a good time, done some good and had made some friends. This meeting had been advertised and talked up. *Some one had seen to it.*

The Unsuccessful Kind.—Traveled over 200 miles to attend this one, an evening Grange meeting early in June. It was a beautiful day. I was duly met at station and kindly taken charge of by a Granger who was of the easy-going type. About 8.15 P. M. he "guessed we'd better go over to the hall and see if folks were turning up." About a dozen had arrived. Some of these were surprised to know there "was to be any speakin'." At 8.35 the Grange convened to transact routine work; at 9.30 the speaker was invited to take the floor. Think of beginning a speech to an audience of men who had worked hard in the fields for 12 hours that day at 9.30 P. M., and yet the speaker had been expressly asked for that purpose! A glance at the audience showed an interesting picture. Twenty-five or 30 men and a dozen women sat around the walls with chairs tilted at various angles according to the sitter's idea of comfort—all prepared to take it as easy as possible. And they did. The soothing tones of the speaker's voice sent half a dozen to sleep within 10 minutes. The speaker told an anecdote. This woke one of them, who celebrated his waking by a solo guffaw after everyone else had finished. The women were more interested in studying the attitude of the slumberers than the remarks of the speaker, and finally organized a whispering and tittering club at one side. The speaker struggled on. Finally one sleeper with a throat affection broke into a blood-curdling snore which awoke the entire company, and sent the giggling part of the audience off into a fresh attack of titters. The speaker threw up the sponge and retired as gracefully as possible. It was 10.15. Certainly time for everyone present to be in bed. But the evening had been wasted. The visitor's time and the State's money had been wasted, and the audience went away disappointed. What was the trouble? A listening, thinking audience had not come. No one took it upon him or herself to work up an interest, a newspaper notice or two appeared, but were undoubtedly overlooked. What is everybody's business is nobody's business. Let us labor to make the Grange what it should be—a live factor in the social, business and public life of the farmer.

Next week we will say something about transplanting strawberries during wet weather.

A CITY MAN TURNS FARMER.

Part VIII.

At the commencement of my last article I asked some questions that might be in the mind of a man seeking how he could make a living on a farm, and will proceed to answer them.

In the first place, what did we produce? A 300-pound hog gave us lard enough, and salt pork enough to last a year; the hams and shoulders we cured and smoked, then cut them in slices and partly fried, and packing tightly in stone pars poured the hot fat on top, thus completely sealing them. We have never found any way of keeping hams so good as this. The fresh pork, spare ribs, sausage, etc., kept us in meat nearly all Winter. Milk, butter, eggs, and all the poultry we wanted to eat, with plenty of potatoes, turnips, cabbages and apples, saved any expenditure of money in that direction.

We had four large sweet cherry trees, two of large White Oxhearts, and two of black ones. From one tree we sold $9 worth, and preserved enough to have sold for $3 more. So the output of that one tree was equal to $300 in a savings bank at four per cent. We had preserves of all kinds, field beans enough for a year's supply of baked beans.

Now let us see what there is yet to buy. Flour, tea and coffee, sugar and fresh meat; as to the latter the route of the bi-weekly butcher's cart did not come nearer than half a mile to our house, and the bother of going up to wait for the butcher undoubtedly lessened our meat bill considerably. As we made no attempt to raise our grain, but bought it all, the grain bill was the heaviest single item of expense. But this was more than paid for by the hens, leaving the money received from the sale of butter to pay above expenses. We were so well supplied with clothing when we came from the city that it was several years before the expense for clothes became an item of much consideration. So we did not have to run in debt, but with good management not only paid all expenses, but continually added buildings and conveniences.

I clapboarded the back of the house, put in new window casings, shingled the whole roof, painted the house twice, moved a large grapevine, and put up an arbor on the south side of the house; in fact, made so many improvements that neighbors remarked they would hardly know the place. Being in poor health most of the time I have been compelled to hire all my plowing done, and most of the hoeing and cultivating. Haying for several years I have not attempted to do myself; paying a certain sum to have it cut, cured and put in the barn. Notwithstanding the handicap of ill-health, and being forced to hire so much help, we have not only made a living, but every year have added buildings, new wire fences, set out trees, or other betterments to the farm, and I honestly think that the success we have achieved is due mainly to my hens. That little busy hen, sneered at by most farmers, merely tolerated by some, utterly ignored by others, is, when properly cared for, the most profitable thing on a farm. *"When properly cared for,"* must be put in italics, for nothing will resent neglect quicker.

Can any man, then, make a living on a farm by keeping 200 hens? Undoubtedly no. He must serve his apprenticeship to the business, and must have a natural liking for hens. He must be a henman, as others are horsemen, cowmen, dogmen, etc. And there will be seasons when under precisely similar conditions so far as we can see, the hens will not do so well, but I am convinced that for each dollar of capital invested, taking one year with another, hens will pay better than anything else. G. A. C.

"TAKE A DAY OFF AND REST."

A Maine Farmer Tries It.

Along in June after much planting, sowing, hoeing and whoaing, I had an attack of the farmer's tired feeling, and took a day off, as advised by the editor of this paper. I do not, like some, believe all I see, but I did think I could rely on such a recommendation, and was grievously disappointed, for I think I was never more tired in my life than after that day of rest. I took the little girl, my only boy and boon companion, now her brothers are away at school, and we went down the Kennebec Valley to Augusta, and visited the State House, where every two years wonderful things are talked of which, somehow, never happen as expected. As we lounged about on the slippery seats in the corridors there came to mind a line of the beautiful hymn,

"All the wide world to either pole
Hath not for thee a home."

In these big edifices of brick and stone and iron, marble staircases and luxurious offices, there should be one place for the *owners;* a comfortable room, with settees and a few easy chairs, and lounges, where a farmer, on business at the Capitol, could bring his wife and children. After seeing the sights, the wife could lay the baby down, and the tired girl and boy could rest and sleep, with convenient lavatories, and an attendant or two to take people around and show them all that is worth seeing. There were push buttons in the walls, but in these days of "You push the button and I do the rest," how should I know but I might turn on the electric lights or call out the militia or the whole Augusta fire department; or old Gov. Powers himself might stand in the doorway, shaking his mane and saying, "My friend, what can I do for *you?*" It would be mighty embarrassing this year, for the boys have nominated another man, and I couldn't tell him how pleased I should be to vote for him.

There should be a diagram of the building, with plain directions for the plain men who come here. How could I tell whether the Agricultural Department, for instance, is located up under the dome, in an atmosphere suitable for corn, or down in the basement, in a temperature about right for potatoes or mushrooms? I knew the officers, any of them, would be glad to tell me, would be glad to see me, and learn of the short crop of hay and caterpillars up on the Sebasticook, but I reflected that they would soon learn all about these things in the Boston dailies, so I contented myself with feasting my eyes on the portraits of G. Washington and other worthies which do so much to adorn our public buildings nowadays, as well as "point a moral and adorn a tale" for confiding youth. I used to think that the benignant presence of these gentlemen might be a help to our legislators and enable them to resist temptation when wild schemes are in the air. Some of the doings here might well cause the portraits to blush, but I never heard of their affecting a member that way. The elevator was cosy and inviting, and the little girl rode up and down to her great delight, while I talked with the veteran who managed it and who knew lots of the folks up river. Finally he left his post for a few minutes, and opened up for us the two assembly rooms, where we found the seats "luxuriant," as the little girl called them, and the carpets all but knee deep. But think of their being unseen so long, while we had to rest on the hard seats in the lobbies. And out under the oaks and elms, where there there should be a sort of picnic ground for taxpayers, there was a sign reading: "Newly seeded to grass; no passing." I noticed in passing that the State is in the business of growing hawkweed, which is already ruining farms almost in sight of the Capitol. This whole valley in fact is a flower garden in June, and no wonder the western man said he couldn't see how the farmers of Maine raised anything, all the land seemed devoted to flowers. I think myself that we could well dispute with China the title of "Flowery Kingdom." After our 20-mile ride up river, the little girl was fresh as a daisy, while as to her father, there didn't seem to be much left of him. This illustrates the difference between what the bicyclers call "resilient" youth, and inelastic maturity. C. S. PAINE.

Cure before cost, of course; but besides being a wonderful curative for Throat and Lung diseases. Dr. D. Jayne's Expectorant is about the least expensive remedy; it takes so little of it.—*Adv.*

Death to Lice on Hens and Chicks. 64-page Book FREE. D. J. LAMBERT, Box 307, Apponaug, R. I.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

SOME ATTRACTIVE COLUMBINES.—One of the brightest and cleanest growing of herbaceous perennials is the Aquilegia, or columbine, not sufficiently seen in country gardens. When met with at all the varieties are usually commonplace seedlings of the European A. vulgaris. The beautiful long-spurred native species, A. Canadensis, so common in eastern woodlands, and A. chrysantha, the golden columbine of the Rocky Mountains, should be more often planted. Many large and brilliant hybrids have been raised between the American and European species, some of which are represented on the first page, Fig. 180. The colors vary from pure white to scarlet and brilliant orange. Some have also beautiful shades of lilac, blue and purple. The foreign varieties run to the latter colors. The most admired of all hybrids is probably A. Stuarti. A plant has just bloomed on the Rural Grounds bearing flowers almost four inches across, bright clear blue, with white center. Seeds of these choice varieties are not always easy to obtain, as when sent out by even the most reliable houses they are often found to produce very inferior forms. This defective seed is probably the result of natural cross-pollination, as the most diverse species hybridize readily when grown together. Columbines may be easily grown from fresh seeds and bloom the second year. Many of the best varieties only bloom two or three seasons before dying out, but they may be kept longer by annual transplanting, which does not greatly impair their blooming qualities. The best plants may be increased by division, but the process is uncertain and seldom resorted to, as seedlings are so readily grown. When as much care is given to the production of Aquilegia seed as is bestowed on more popular plants the result may be a great transformation, as there is more to recommend the genus in its natural state than most others. Some of the older species bear double flowers, but they are not generally so much admired as the more graceful single forms, though they last somewhat longer.

THE LATE SEASON.—The tardiness of the season was made evident to all by the character of the available blooms on Decoration Day, May 30. A few apple blossoms could still be found, but they were too far gone for use. Diervillas, better known as Weigelas, were still in bud, though the light flowered varieties, such as D. rosea and D. candida, are usually expected to be far advanced in bloom by this date. Deutzia gracilis is counted on to furnish its quota of snowy Convallaria-like blooms, and did not entirely disappoint us this trying season, but it was just coming into bloom instead of being nearly through, as in previous years. The effect of the constant rains is now plainly noticed among the tree fruits. Cherries, plums and peaches have set only a fraction of the fruits that might reasonably be expected from the heavy bloom. Pears set very thinly and it is yet too soon to speak of apples, though they may be expected to suffer most, as they scarcely had any sunny weather through their extended flowering period. Strawberries and most bush fruits promise well. It is not easy to understand how the pistillate varieties got their pollen during the persistent foggy and showery weather. The reduction in the number of fruits to be developed may have a good effect in increasing size and quality. One unusual result of the cold and late season is the large quantity of tender seeds used for replanting. Local dealers who sell a few pounds of melon and cucumber seeds and Lima beans in ordinary seasons report sales by the hundredweight. It is necessary to be early in the market with all products, and the truckers or gardeners are willing to take all chances of unfavorable weather in order to secure the earliest possible crop.

NOT SO MANY BUGS.—Last year we were overrun with cutworms, Potato beetles and other enterprising insects at this season, but there is a noticeable scarcity of everything but earthworms in the damp soil. Even the prevalent Rose bug is seldom seen when planting. The cool weather and excess of moisture has evidently much delayed the development of these pests, but they may be expected to put in an appearance later. It is hoped that their numbers will be diminished when they do come. Potatoes have not had such a good local start of the beetles for a generation. They are looking extremely well where planted on well-drained soil, and many plots are showing bloom at this writing (June 8). It will not do to allow our batteries for insect warfare to get out of order, as they may be urgently needed. A comparative immunity from insect pests is often one of the compensations of a wet season. Most insects are livelier, and do more damage, when it is hot and dry.

THE ICICLE RADISH.—This is the very taking name of a highly bred white early radish first offered last season. When grown properly it is clear and crisp enough to warrant the comparison. Much care is taken to breed these improved strains of radishes true to type, and they now come in great perfection of color and form, coming to edible maturity in an incredibly short time. A recent test of 200 varieties is reported in the Gardener's Chronicle, an English publication. Many were found to be identical with those sold under another name, thus reducing the actually distinct forms more than one-half, and not more than 20 varieties were really found worth growing under the conditions of the test. Europeans divide their radishes into "forcing" and "frame" varieties, including all the compact, quick-growing kinds under the first designation. We use practically the same varieties for market forcing, as most radish seed used in this country is imported, but in some localities Summer varieties of good quality have originated which perpetuate their characteristics with much uniformity. In many old gardens these Summer and Fall radishes are highly prized as being of better quality than any grown from commercial seeds. In the extensive trial mentioned it was declared that no distinctive flavor was characteristic of any one of the many varieties, the only difference being degrees of tenderness or succulence. The Icicle radish is a long, smooth, clear white variety of most excellent quality when quickly grown, but it does not stand Summer heat well on the Rural Grounds. W. V. F.

Experiments With Tulips.

Perhaps a little tulip experience will be of interest to some of your readers. I have long been desirous of having them blossom later in the season than they usually do. Reading in some of the periodicals that if bulbs are planted very late, and well mulched, one could have blossoms in Autumn, I put out bulbs December 3 as directed, but greatly to my disappointment they blossomed simultaneously with those set in September. April 11, of the present season, 100 bulbs were planted, and greatly to my surprise they were in full bloom May 24, slightly smaller in size; about 20 varieties were set. Is it possible to have tulips blossom in Autumn? I purpose to make another planting in June as a further experiment. All the authorities are agreed that tulips should be set in the Fall, but my one trial indicates that this practice is not absolutely necessary. I grow tulips by the thousand, of many different varieties, and leave them in the ground unless the bulbs are wanted. They can be planted deep, eight to 10 inches, or more; then when done growing the ground can be spaded without disturbing the bulbs, and late flowers planted, Asters, Zinnias, marigolds and the like. N. R.

Syracuse, N. Y.

R. N.-Y.—It is scarcely possible to induce tulips to bloom in the Fall by any method of delay or bulb storage. It is essentially a Spring-blooming plant. With most bulbous plants a delay in planting the dormant bulbs does not indicate a corresponding delay in the blooming period, as the vital activity rapidly increases after the natural period of growth is passed. Two hyacinths or Gladioli of the same variety may be planted at an interval of several months but their bloom spikes will appear at most a few weeks apart.

Forcing Rhubarb in Winter.

In THE R. N.-Y. of May 4 an article on Winter Delicacies, tells of the forcing of rhubarb. Will you inform me how to prepare it, as I wish to try growing some in my cellar next Winter? B. D. B

Salamanca, N. Y.

The preparation of rhubarb for Winter forcing consist in the selection of strong three or four-year stools, cultivating and fertilizing during the Summer so as to produce a strong leaf growth, with a corresponding storage of vitality in the roots. In early Winter, just before freezing weather, dig up the clumps, preserving as much soil as possible, replace them in the holes from which they have been loosened, covering lightly with loose earth to preserve moisture. When a freezing night is imminent lift out the clumps and expose to frost. In the morning, if well frozen, they can be handled like rocks without crumbling. They may then be removed to the cellar or greenhouse, placed in position in some suitable corner, and sufficient loose soil sifted over to fill all crevices. In a day or two, after the frost is out of the clump, it is necessary to water down well to compact the soil, which should afterward be kept at a growing moisture. In the Rural Grounds cellar the heat is supplied by a hot-water pipe leading to a greenhouse. The ordinary unheated cellar is too cool to force rhubarb much before it grows outside, but by curtaining off a corner with blankets and using a large lantern or oil stove it can be had in midwinter.

CRIMSON CLOVER.—The Crimson clover was the finest we ever had; the tomato ground we plowed the second week in April and set to blackberries. It was six inches high on the pickle ground the last of April and set to raspberries. It was just like setting them in a meadow. We plowed a furrow and set them about six inches deep. Now they are about a foot high. This has been a great Spring for plant setting. We set in all 20 acres. The old bed of strawberries will average from 12 to 15 inches high; our raspberry bushes from five to six feet across top. I have counted 75 to 100 limbs on a bush. Our blackberries are as good as last year. If it doesn't stop raining we will have to mulch our berries with something beside dust this year. As straw is very high I will try shavings.

Syracuse, N. Y. CHAS. SIDDONS.

GRAFTING CHERRIES.—We followed Mr. Van Deman's advice, and grafted one of our black cherry trees. The tree is about 12 inches through and 25 feet high. We got some very good scions from a neighbor, and set them April 22. We sawed the stubs to a 45-degree angle, split one side of the pith, and put in one scion of two buds; so far as we are able to discern from the ground they are all alive. We also grafted several apple trees in the same manner, cutting some stubs four inches in diameter, with excellent results. We were able to graft a large top with about 25 scions, quite an improvement over the commercial plan in vogue here, where 100 or more would have been used! Besides, we have a comparatively low top. We also grafted about 50 plum roots we dug from a thicket with Japan varieties with fair success. This is our first experience. J. A. O.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page

It is admitted by all classes of fruit growers and farmers that my 5 gallon compressed air sprayer is the most durable made. This reduction is made for a limited time only. Take advantage of the liberal offer—it may be your last opportunity to get the sprayer at the reduced price. $3 75 for galvanized steel, $5.00 for copper. Will throw a good stream 25 to 30 feet. Good pressure 20 to 30 minutes. The tallest fruit tree can be sprayed. Order to-day Salary to reliable men. Address MARTIN WAHL Rochester, N. Y.

Hope Farm Notes

MUSIC HATH CHARMS.—When I mentioned Julia, our kicking cow, I had no idea there was so much interest in these heel-and-toe workers. We have had a run of ridicule, advice, suggestion, abuse and sympathy. Now comes a man with a clipping from Hoard's Dairyman. The cow mentioned was "particularly vicious" (though I will match Julia against her):

It was necessary to tie her in the stall while his two boys milked her. Now, Mr. Wentworth's boys are good singers and cannot resist the temptation to indulge in song, while at their work. One day they started up "My Old Kentucky Home" while milking Betsy, and were surprised to discover that the cow suddenly became docile. After that they found it was not necessary to tie her, and she would stand patiently in the yard while the milking was in progress, so long as she heard the refrains of "Dixie," "Take Me Back to Old Virginny" and other old melodies.

I don't pretend to be much of a singer myself. On a few brief occasions when I have tried to sing in public, the audience did not appear to go to sleep. It has been suggested that an appropriate song to sing while pulling Julia's teats would be "My soul, be on thy guard!" That is doubly appropriate, for the best way to receive a kick is to hold up the sole of the boot and let the shin of the kicker strike it! He won't kick twice in the same hour. But we have pretty well conquered Julia. It's a case of prohibition though—and happily, in this case, it prohibits.

THE BLIND SEE.—There are some things about farming so clear and plain that they would be evident to a blind man. We have rye in the old pear orchard which fronts on the main road. I intended to cut the rye early for hay, but the rain prevented that, and it is now well headed. Last year we used this orchard as a sort of experiment place. In one aisle we had cow peas, in another Soy beans, in others sorghum, Kaffir corn, potatoes, corn fodder, etc. The rye clearly shows where the cow peas grew last year. This crop will always show itself in whatever follows it. . . . Another thing with a clear history is the strip in the apple orchard where the oats were not treated with formaldehyde. In sowing the oats Charlie ran a little short of the treated seed, and took part of a bushel which had not been wet with the solution. You can see the difference without trouble. This seems to prove what the scientific men tell us—viz., that the smut germs are in the seed. If they are not destroyed, they begin their work at once in a season like this, and the plant never has a fair chance. . . . Another thing that a man with a wooden leg could feel as he walked over the field is the difference in plowing with our heavy reversible sulky and the light walking plow. Both plows were used in the cornfield. The heavy sulky stayed at its work and turned and crumbled the soil into an ash heap. The lighter walking plow jumped and danced more or less in the tough, sticky soil, and left it cloddy and hard.

FARM NOTES.—Our corn was late, but it went in right. I shall keep planting corn until June 20, and then finish planting potatoes. No, I would not advise others to do this. I shall take the risk because there is nothing else to do. . . . The rye and Crimson clover were well cured. This curing was done in the cock, and the fodder turned out green and bright. The rye is a little too hard for good hay. The horses eat all the clover and all the rye heads, and nibble a fair share of the straw. What they leave makes the finest of bedding. Right now is the time when the farm team should have a soft bed. They should work hard by day and sleep well at night. . . . As usual, where we cut the Crimson clover in the upper orchard many heads were left. There are a few jobs in which it pays to be careless—cutting Crimson clover is one of them. I like to let plenty of the heads go to seed. Thus the crop reseeds itself and comes in year after year—a most welcome visitor to me. . . . I picked wild strawberries at least 10 days before any of the early cultivated varieties were ripe. We have some of these wild or vagrant plants under cultivation to see what they will come to. When these plants get into so-called civilized society I don't believe they will get up quite so early. As they produce larger fruit under cultivation they will take more time for it. . . . Hay and hoeing will come together this year. The grass has made a rapid growth, and will be a heavy and bulky crop, but the quality will be low. There can be no heart in grass or anything else without plenty of sunshine. My "Clark" grass doesn't grow as I hoped it would. It is very thick, but quite short.

THE WEATHER.—The rain finally washed out and the sun began business in a half-hearted way. After a day spent in chasing clouds off the sky he took courage and really went at his business. Oh! but didn't the sunshine do us all good? The blades of grass had begun to turn yellow at the ends. They shook themselves and started again. Every living thing that could do so crawled out of its brooding place and just basked in the sun's rays. After three or four days of brightness it was a pleasant thing to see the sun go out of sight behind the Hope Farm hill. Great squares and patches of light lay along the lawn, and on the oats in the orchard, where the sun poked his last "good night" through the trees. The rye crinkled and waved in the wind and every spring and tiny stream in the valley sparkled and glittered whenever the water passed out of the shadow. But there was little time to stop and look at light and shadow pictures, for no one knew when the next rain was coming. It was jump and get the ground into shape! At present the indications are for fine weather. We need it, but have no time to celebrate its advent.

FRUIT PROSPECTS.—Our apples promise a fair crop. The Baldwins have taken a year off, except in the case of a few trees, which seem to bear year after year. The Greenings promise well, and the early varieties are mostly loaded. I hear some complaint about a failure of trees to set the fruit even after full blooming. I find little of this in our orchards—in fact, there is, if anything, too much fruit on most of the trees. Spraying this year seems a failure. The constant rains kept the leaves thoroughly washed. I can only hope that apple insects will be as scarce as others appear to be. Pears look well with us. The old trees show the result of plowing and manuring, and have put out much new wood and have fine foliage. Cherries promise well. I had given the crop up, as I could not see how the flowers could be properly fertilized during the heavy rains. In some way the work was done, and the trees are already beginning to bend to the ground. My Stringfellow peach trees have surprised us all. Not one per cent has died thus far, and most of them have started a vigorous growth. Some of them, set in a damp place, look sick, but it is no situation for peaches anyway. I am not advocating this method yet—I am watching it.

STOCK AND DAIRY.—The hens laid 642 eggs in May. About 38 hens did this. It is a poor record on paper, but good when compared with many actual results in the yards near us. It is one thing to tell what a hen ought to do, and quite another to make her go and do it. . . . Just two chickens—one Wyandotte and a White Leghorn—remain of the $10 outfit of eggs which were bought early in the season. These $5 birds might well be called *guinea* fowls! They are both roosters, and we hope to give them a chance to hand a few $5 bills down to their daughters. We have not far from 225 little chicks from Hope Farm eggs, as bright and lively as need be. They are the children of old Don, who is ready to fight a horse if need be. In former years we have let the young roosters grow to nearly full size. This year I mean to have them picked out as soon as possible and put by themselves for fattening. The quicker they make their way to the frying pan, the more likely we are to have something to crow over. We may well do our crowing before they do theirs. . . . The milk trade is still good. We usually find it cheaper to sell milk and buy butter, but of late we have been making more or less as cream is left unsold. A fine batch of Hope Farm butter appeared on the table last week. It was so good that I began to investigate to see what churn was used. To my surprise I found that Charlie made it by shaking up the cream in a glass fruit jar! After all, that gives the butter globules about as fair a chance to get together as they are likely to get in any churn. H. W. C.

New York Fruit Display at the Pan-American Exposition.

The fruit display from the State of New York in Horticultural Hall, at the Pan-American Exposition, is so remarkable that it deserves special mention, and I think the people of this State, at least, would be interested in knowing about it. It has been splendidly managed from the first, and great credit is due S. D. Willard and his assistant, F. E. Dawley, who are at the head of it, and under them others who did the work of collecting all over the State, many of whom are unknown to me, but their fruit is here to show what they have done. Every county in the State is represented in the hall at this date, including even the county which comprises the city of New York. Beginning late in the Fall, as they had to do after the appropriation was made and apportioned by the board of management, in order that those managing the fruit display knew just what they had to depend upon, they went vigorously to work and selected apples, pears, quinces and grapes and put them in cold storage in such good condition that they have lasted splendidly, and came out this Spring in some cases with only the loss of three or four specimens in a barrel. Each specimen was wrapped in two thicknesses of paper and placed in the Buffalo Cold Storage Warehouse. When the Exposition was formally opened on May 20 they placed the first fruit on the tables, filling 1,800 plates. It was an astonishment even to themselves to see so fine a showing at so late a date. Even the Catawba and some other varieties of grapes were in good eatable condition, and are so to-day, although they have now been exposed for over three weeks; but some have rotted and been replaced. The coloring of the apples is about as good as could be desired, and the flavor of the apples and pears is about the same as it was last Fall or any time during the Winter, though some of the earlier kinds are somewhat "off" in this respect. Fall Pippin, Rambo and others that are not expected to keep very far into the Winter came out in good condition.

As to the future, we have every reason to believe that the State of New York will be splendidly represented in the fruit line at this Exposition. Those who have the matter in charge are taking active steps to secure every kind of fruit that grows within the limits of the State, and if they are properly treated by the people at home, as they doubtless will be, New York will come out with abundant laurels. While the fruit already shown has been carefully examined, and notes made preparatory to awards, the Exposition authorities are not ready to publish these awards for a little time yet; but everyone who has made creditable contributions to the exhibits will not be disappointed in what he will receive. H. E. VAN DEMAN.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from **Horses** and **Cattle. SUPERSEDES ALL CAUTERY OR FIRING.** *Impossible to produce scar or blemish.*

Every bottle sold is warranted to give satisfaction Price **$1.50** per bottle. Sold by druggists, or sent by express, **charges paid,** with full directions for its use. Send for descriptive circulars.

THE LAWRENCE-WILLIAMS CO., Cleveland O.

NO MORE BACKACHE.

The Miller Bean Harvester

will successfully harvest your BEANS, COW PEAS and Soy Beans. Catalogue and prices for the asking.

We also make the LE ROY PLOWS.

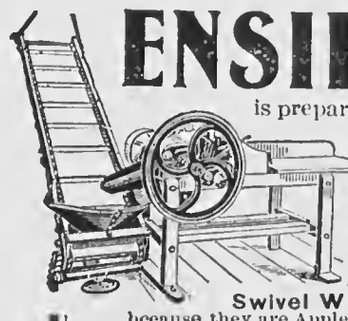
LE ROY PLOW CO.,

61 Lake Street, Le Roy, N. Y.

How to Drain Land Profitably.

On every farm there is probably some land that could be made more productive by underdrainage. Properly drained land can always be worked earlier, and more profitably. The ROUND TILE best and most economical way to drain is explained in the book, "Benefits of Drainage and How to Drain," which is sent *free* by JOHN H. JACKSON, 76 Third Avenue, Albany, N. Y.

ENSILAGE



is prepared quickly and to the best advantage by the use of **"New Hero" Cutters** with or without self feed table, with swivel fodder carriers or **Swivel Wind Stackers** because they are Appleton Quality

MACHINERY.

SIMPLEST IN CONSTRUCTION, EASIEST TO OPERATE. MOST EFFECTIVE IN OPERATION, STRONGEST AND MOST DURABLE.

We make also a complete line of Grinders, Shellers, Huskers, Shredders, Wood Saws, Wind Mills, Tanks, Sweep and Tread Horse Powers, etc.

APPLETON MFG. CO.,

27 Fargo St., BATAVIA, ILL.

A Good Wagon

begins with good wheels. Unless the wheels are good the wagon is a failure. IF YOU BUY THE **ELECTRIC STEEL WHEEL** made to fit any wagon—your wagon will always have good wheels. Can't dry out or rot. No loose tires. Any height, any width tire. Catalog free.

ELECTRIC WHEEL CO.

Box 88 QUINCY, ILL.

STEEL WHEELS for your **FARM WAGONS**

any size wanted, any width of tire. **Hubs to fit any axle. No blacksmith's bills to pay.** No tires to reset. Fit your old wagon with low steel wheels with wide tires at low price. Our catalogue tells you how to do it. Address

EMPIRE MFG. CO., Quincy, Ill.

Easy Harness

All harness, old or new, is made pliable and easy—will look better and wear longer—by the use of

Eureka Harness Oil

The finest preservative for leather ever discovered. Saves many times its cost by improved appearance and in the cost of repairs. Sold everywhere in cans—all sizes.

Made by STANDARD OIL CO.

Improved Kemp Manure Spreader

This is the only machine made that will spread evenly and perfectly all kinds of manure, wood ashes, salt, lime, etc. Tears apart, makes fine and distributes evenly the hardest, caked and coarest manure, no matter how full of straw, corn stalks, etc. Machine is greatly improved for 1901. The driver does not have to leave the seat from the time he leaves the manure heap until he gets back again. Send for latest catalog describing all improvement and telling "How to Grow Big Crops," Mailed free.

Remember that the only original and genuine Kemp Manure Spreader is made by us.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, JUNE 22, 1901.

ASPARAGUS is a crop that seems to offer good chances to the careful grower. Prices have been good. The use of this vegetable is constantly increasing. The rust has killed out many fields, and kept many farmers from starting new ones. These things warn careless growers to shun asparagus, yet invite good and careful farmers to try it. During the season we expect to give a good deal of attention to this crop—especially with reference to the best method of fighting the rust.

*

DURING the 10 months ending in April the total exports from this country amounted to $1,238,554,264. Of this $84,784,364 worth was carried in cars, $64,927,406 in American ships and $1,088,842,498 in foreign ships. The proportion of imports brought in American ships was larger, but it is true that England and Germany are doing most of Uncle Sam's foreign delivery. The question is, would he better off to do it himself? If so, how much? Enough better to afford to pay a big price for the privilege?

*

IF any farmer is frightened into selling his apples at the first low offer this year it will be his own fault. Careful reports are coming in from the sections where fruit is grown largely for market. The cold wet season has undoubtedly hurt the prospect for apples. Even where the bloom was very heavy many trees have but little fruit. It is, of course, still too early to make definite predictions, but as compared with same date in former years the outlook is for a low apple crop—which ought to mean high prices.

*

IT is said that farmers in a section of eastern Washington are about to try a novel plan for marketing their wheat. These wheat fields are on high ground, and great canons make carting it to market a difficult job. The new plan is to build a cable tramway from the bluffs to warehouses on the Snake River, about two miles distant. From this cable will be suspended baskets each holding a two-bushel sack of grain. It will work on the gravity system, and it is expected that from 250,000 to 400,000 bushels will be handled on it this year.

*

NEW Jersey is the mother of trusts and the nurse of oleo peddlers. These bogus butter rogues come across the ferries into New York and attempt to sell their stuff. Now, as appears from the statement on page 444, they send little boys with their wagons, hoping in that way to escape detection. This is their latest wrinkle of conscience, and it is the smallest business yet—in all respects. It is bad enough to turn a man's conscience into tallow, but to turn the cream of a young boy's life into lard gravy is a master stroke in wickedness—even for an oleo rogue.

*

ONE of the large life insurance companies is making total abstinence from intoxicants an object to its policy holders, since those who agree to abstinence during the life of the policy will get cut rates. The innovation was adopted at the solicitation of some of its largest policy holders, who based their claims on the ground that mortuary statistics showed a higher death rate among men who drank than among those who were abstainers, and that consequently the policy holders who did not drink were being charged to make good the losses, accruing from those who did. This plan of making non-drinkers preferred risks has been in vogue for some time in the old world, though new to the United States. The new class will include any accepted policy holder declaring himself a total abstainer, who would agree to remain such during the life of his policy. Among the men at whose instance the plan was put in operation are John Wanamaker, Dr. Edward Everett Hale, Booker T. Washington, Senator Frye, Senator Tillman and ex-Mayor Hewitt, of New York.

*

OUR reports indicate that the Green pea-louse is becoming destructive once more. The wet weather held it in check, but now it is doing great damage in several localities. At Moorestown, N. J., a new spraying machine was tested. It is an expensive machine which picks or shakes up the vines and thoroughly sprays them with the whale-oil soap solution. It works so well that experts declare that it solves the problem where peas are grown on large areas. It is not likely that smaller growers can afford such a costly machine. If the pea-louse continues its destructive work the industry of pea growing for canners may be forced into the hands of a few very large growers, who can plant large areas and use these machines.

*

WE know of people who went to a seaside resort last Summer. They demanded pure milk, but were served with an article that *would not sour*. It was actually so drugged with chemical "preservatives" that it would remain for days without going through the process of souring. Think of giving such stuff to a baby, or even putting any quantity of it into the strongest stomach! The milkman finally agreed to give them milk that would sour—that being the most practical test they could think of to prevent the delivery of milk that might almost be used for embalming purposes! That is the most remarkable milk test we ever heard of. Is it not a shame that this drugged and poisoned milk should be sold? We believe that most of these dangerous chemicals are added by dealers in the city. Any man who will drug milk should be treated as a common poisoner.

*

THE Central-Hudson Steamboat Company has decided to make some changes in its plan of carrying empty fruit packages. They agree to charge three cents for each empty crate or tray carried from New York, and to reduce the freight rate on full packages three cents per package. The rates for gift packages will not be changed. The Company takes this action as a result of the conference with fruit growers recently reported in THE R. N.-Y. When the notice of these changes was first sent out growers were not fully satisfied, as the statement was too indefinite. Another committee called on the steamboat company and finally secured an exact statement. Empty fruit packages will be handled the same as any other freight. These packages will be receipted for and agents will be required to count and deliver as they would if filled with goods. The company agrees to have help enough on the docks to sort out the "empties" and see that they are properly delivered. The company certainly shows a disposition to be fair, and we believe this change will benefit regular shippers of fruit.

*

ON a good many northern farms, haying, hoeing and even planting will crowd into June this season, but we fear that a good many farmers will feel so behind on account of the unusual wet season that has forced the hay crop to early maturity and so hindered planting, that they will put off haying a week or two later than usual rather than commencing a week earlier. This will be very poor economy. Even if one does depend much upon silage, early-cut hay is one of the most important parts of the cow's ration, and one cannot afford to put off haying. It will be better if possible to get extra help and push the haying early. The cows will repay very handsomely all through the year when fed on good early-cut hay. There is just about twice as much nutriment, or rather digestible protein, in the early-cut as against the later-cut hay. The tendency this year will be to plant before properly fitting land, but we have found that expensive, and future cultivation can be decidedly cheapened by having the land in good shape before planting. Otherwise you will have extra cultivation to do, besides hand hoeing in the busiest season.

*

FOR the past few years THE R. N.-Y. has discussed the use of compressed air as power for spraying. We have pictured several machines which did the work well, because they were strong and capable of withstanding a powerful pressure. All this has created a demand for small sprayers which may be operated by an air pump. Some manufacturers have taken advantage of this demand by making extravagant claims for their machines. They issue circulars picturing women putting out fires, men washing wagons, and other jobs which would require the full force of a powerful pump. A customer sends for one of these famous "sprayers" and receives a can holding perhaps 10 quarts with an outlet perhaps the size of a pipe stem. Naturally, after reading the flaming circular the buyer feels that he has been swindled. In his wrath at finding that he cannot wash windows or wagons he forgets that he *can* spray vines and shrubs, and throws the whole thing aside. The manufacturer has no business to make these foolish claims for his little sprayer. The buyer has no more business to believe that any human being can ever give him a business machine for the price of a mere toy.

*

THE following letter from a reader in New York State enables us to explain an important matter:

> I am interested in the contemplated pure butter law, and in what way can I exert the most good for the cause? You have mentioned in THE R. N.-Y. that one Wadsworth is antagonizing the cause of the cow. What is the position he holds, and by whom is he appointed?
> M. J. U.

The "one Wadsworth" referred to is J. W. Wadsworth, a Member of Congress from New York State. He is chairman of the House Committee on Agriculture. We believe that he did all he could to delay and defeat the Grout anti-oleo bill. He was finally beaten in his own committee, and on the floor of the House, but in spite of all he was able to hold the bill back so long that it failed in the Senate for lack of time. He went before the Senate committee and did his best to defeat the bill there. The Grout bill is and was loyally supported by the plain, working farmers of the country. Many who never make or sell a pound of butter support it because the underlying principle of it is opposition to fraudulent or counterfeit food products. Farmers demand the passage of this bill both individually and through their organizations. The following propositions therefore seem fair and clear:

1. The majority of American farmers demand the Grout anti-oleo bill.
2. James W. Wadsworth is determined to prevent its passage if he can.
3. The chairman of the Agricultural Committee can exert great influence for or against the bill.
4. The farmers have a right to demand that the head of this important committee shall be a friend and not an acknowledged foe.

Mr. Wadsworth was appointed by the Speaker of the House, Hon. D. B. Henderson. The most effective work that this correspondent or others like him can do now is to write a strong letter to Mr. Henderson at Washington protesting against Wadsworth as chairman. We would make such letters brief and strong with no possible chance for any "if" or "but." It is entirely possible to write Wadsworth out of his place. By so doing we shall spike one of the great guns of oleo. Up and at him!

*

BREVITIES.

"Show me the perfect man!" the speaker cried,
With arms aloft and large mouth open wide;
"Show him or name him!" Then he paused for breath,
And through a stillness that was like to death,
A little man on a back seat arose—
He cleared his throat and stood upon his toes.
One of these little dried-up, hairless men,
As nervous and important as a hen.
"Know ye this perfect man?" the speaker said.
"I've heard of him full oft, but now, he's dead,
Too good to fit our faulty human plan;
My wife's first husband was the perfect man!"

HAS hot weather really come?

THE ant is a good professor of "animal industry."

HOW do the newer strawberries behave with you?

WE never before found such a demand for "bedbug cures."

THE fumes of hydrocyanic acid gas "go anywhere for business."

WHAT with new bugs and blights and old weather fruit growing has a rocky outlook.

WE are obliged to skip a week in the articles on soiling at the New Jersey Experiment Station.

LET your neighbor buy experience if you will, but thank him for results—don't laugh at him.

IN England it is a finable offense to sell oleomargarine containing more than 10 per cent butter fat.

"No," said Mrs. Apple Tree to Mr. Rain, "your remarks do not set well with my young folks!"

THE wet weather has kept the Potato beetles back. Many have been killed, but "there are others."

IT looks as though there might be something in this plan of selling live chicks from the incubator.

WHY, yes, the horse's jaw or a home grinding outfit will help destroy the mill due which eats up profit.

HOW can a farmer hope to get the best work out of a machine until he has mastered it, and knows how it works?

A SAMPLE report— "Herkimer, N. Y.: Heavy frost here Sunday night, June 9. Wet, wet, wetter. No plowing to speak of. And everybody blue inside and out."

ONE of the ostriches at the Central Park (New York) menagerie died recently. The bird had had violent attacks of coughing, and consumption was supposed to be the cause. An autopsy showed that the lungs were affected, not by tuberculosis, but by a collar button and kernel of corn, which the bird had in some way got into its windpipe.

Events of the Week.

DOMESTIC.—The National Superintendent of Immigration has issued an order that tuberculosis of the lungs is to be considered a contagious disease, and persons suffering from it are not permitted to enter the United States. . . . . The steamer Assyrian, of the Leyland Line, from Antwerp to Montreal, crashed into a rocky cliff near Cape Race, Newfoundland, June 6. No lives were lost, the crew escaping with difficulty, but the vessel and cargo are likely to be a total loss. . . . . By the explosion of a portable farm engine, at Toledo, O., June 7, the building occupied by the Banty Supply Company, dealers in agricultural machinery, was wrecked, and Henry Lingerman was killed. . . . . A fire at Lexington, Ky., June 7, destroyed 23 houses, and caused a loss of $80,000. . . . . A freight-train collision at Vestal, N. Y., June 9, exploded a quantity of dynamite, which killed six men and wounded others. . . . . A tornado and cloudburst swept over Oklahoma June 7, being especially severe in Noble and Kay counties; 10 persons reported killed and much property loss. . . . . The sale of the Kiowa and Comanche reservations in Oklahoma will be stopped by an injunction of the Supreme Court of the District of Columbia. Lands worth millions of dollars were to be distributed by lot. . . . . A baby was killed and several persons were badly injured by a tornado June 11, near Lester, Iowa. Many buildings were destroyed. . . . . Twenty-one lives were lost by the explosion in the Pittsburg Coal Company's mine at Port Royal, Pa., June 10. The dead include members of several rescue parties who went in search of the miners, who were cut off by the first explosion.

ADMINISTRATION.—The dispute with the Cuban Constitutional Convention over the acceptance of the Platt amendment is said to be approaching a critical stage. The President is determined not to withdraw the army until the Convention shall have adopted the amendment unaltered, and it is said that propositions are being made to strengthen the garrisons on the island. Members of the Convention are charged with bad faith in making public confidential correspondence entrusted to them by Secretary Root. . . . . The Auditor for the War Department has prepared a table showing the amount of the claim filed by each State and Territory for fitting out volunteer troops during the war with Spain, the amount allowed in each case and the balance claimed to be due. It appears from the table that the total of the claims filed aggregate $5,870,179; that $3,329,745 has been allowed and paid, and that there is still claimed as due $2,540,434. The amounts claimed run from $938,852, in the case of New York, to $1,000 in the case of Utah. Texas is the only State whose claim has been allowed and paid in full. . . . . The United States Government has formally communicated to the foreign powers the impossibility of joining in a joint guarantee for the payment of the Chinese indemnity. The difficulties in the way of such an arrangement are set forth in the communication, particularly those relating to the constitutional restrictions on the President in making a joint guarantee of this character. The representatives of most of the European Powers in Washington do not believe that a resort to The Hague tribunal, as proposed by the United States, will be acceptable to their governments. . . . . Acting Secretary of War Sanger has received from General Wood a copy of the new regulations as to taxation in Cuba, which go into effect July 1. The interesting feature of the regulations is that plantations destroyed in the war are to pay tax of not more than 66 per cent of properties not destroyed. As to urban property, the tax boards are to prepare new lists to serve as a basis for taxation, and until they are completed the territorial tax will prevail, with a deduction of 25 per cent for repairs and unproductive periods.

FARM AND GARDEN.—Unusual cold was experienced in the Pacific Northwest June 6. The vicinity of Boise, Idaho, was visited by a severe frost, the like of which has not been known at this season for 15 years. The Government Weather Bureau at Boise reports a temperature of 30, while places throughout the valley report temperatures as low as 26 degrees. Fruit is damaged seriously. In the Grande Ronde Valley in Oregon there was snow. The coldest June weather for a period of 20 years was experienced at Baker City, Ore. The mercury fell six degrees below the freezing point. Ice over an inch thick was formed in pools of water on the streets. All fruit was killed, and all vegetables were destroyed. So far as known, growing grain was not seriously injured.

Canada is making a fine exhibit of fruit at the International Exhibition at Glasgow, Scotland, the display of apples from cold storage being especially good.

The agricultural students of the University of Tennessee recently visited Mr. George Vanderbilt's Biltmore Farms near Asheville, N. C. Through the courtesy of Mr. Vanderbilt a series of silver cups and prizes in gold to the value of $110 were offered to the students showing the greatest proficiency in judging Jersey cattle, Berkshire hogs and Southdown sheep respectively. The first two men showing the greatest proficiency in judging all classes of stock were each awarded a sweepstake prize, and to the one writing the best essay on the Biltmore Farms and the lessons to be learned therefrom an additional prize was given. The winners were: Jerseys, first, George W. Machlan, Gowdy, Ind.; second, Gordon E. Kidder, Harriman, Tenn. Swine, first, W. A. Warren, Jr., Mulberry, Tenn.; second, J. W. Young, Clinton, Tenn. Sheep, first, Wm. Fyfe, Covington, Tenn.; second, Horace McRath, Flenniken, Tenn. Sweepstake, first, Horace German, Franklin, Tenn.; second, R. R. Ayres, Harriman, Tenn. Essay, Horace McRath.

E. P. Felt, New York State Entomologist, is trying to secure data concerning the ravages of Hessian fly in that State. Entomologists have been recommending the late sowing of Winter wheat as one of the best methods of keeping the pest in check, the idea being to sow it late enough so that it will escape the greater portion of the flies and if no volunteer wheat is allowed to grow, very few eggs can be laid where they will thrive, and as a consequence the Spring brood will be much reduced. Wheat sown in the latitude of Genesee County after September 21 should as a rule be free from the pest. The date may be pushed forward approximately one day for each 100 feet elevation, as the date given is calculated for sea level. This is matter of great practical importance, and Mr. Felt will be glad to have detailed information regarding many infested or non-infested fields in sections troubled by this pest. He would like farmers throughout the State to answer the following questions, giving name and post office: Approximate elevation of field; date of sowing; degree of infestation and size of field; proximity of other wheat fields and if nearby, the date when they were sown; amount of volunteer or wild wheat nearby in which the pest could winter. Address such information to E. P. Felt, State Entomologist, Albany, N. Y.

CROP PROSPECTS.

JUNE 5.—The orchards in this section along the lake shore were very badly eaten by worms two years ago, with the result that we had very little fruit last year; some orchards not any. The orchards back one or two miles did not suffer so much from worms, hence a fairly good crop last year. The orchards that bore full last year did not blossom much this Spring, but those that did not are very full, except Baldwin and Spy. Snow, King and R. I. Greenings are very full. Pear trees blossomed quite fully, but very few plum trees blossomed. Strawberries bid fair to be a good crop if the weather is favorable. As there are very few worms this season I see no reason why we should not have a good apple crop. The apple buyers took advantage of the farmers last year, made them believe there was a very large crop, and bought them for $1.25 per barrel and charged 25 cents each for barrels. B. C. F.
Willsborough, N. Y.

JUNE 6.—The Greening apples were very heavily loaded with blossoms, but I think the heavy rains at blossoming time injured the crop very much. I should judge more than one-quarter of the blossoms will not produce fruit. However, the quality should be much better, as trees could never have matured all the blossoms. Baldwins did not bloom at all. Strawberries, raspberries and peaches promise a fine crop. Currants are affected with a leaf blight, and stems are very short. Grapes were injured by the severe dry weather of last year and many vines did not start. Asparagus cutting rather light but bringing good prices. F. F. Y.
Cedarcliff, N. Y.

JUNE 7.—Peaches, plums and cherries set full crops; pears about half crop. Apples will be a light crop in this vicinity. Baldwins blossomed the least of any. Weather cool and wet; grass looking good. W. A. W.
Falconer, N. Y.

JUNE 7.—Only a very small amount of apples and pears has actually set, and I have no doubt that it is due to the frequent rains at time of bloom, washing pollen away before it had time to fertilize. From a rather superficial examination I would estimate that apples and pears will be not more than a fifth, or even less, of last year's amount. J. G.
Weedsport, N. Y.

JUNE 7.—The blossoms were very good on most apples except Baldwins, which bore so heavily last year, but in talks with the farmers this morning in different sections all are of one opinion, that the apples are dropping badly. They vary in opinions of the coming crop from one-sixteenth to one-fourth of a crop, compared with last year. It is quite early to get at this very accurately. Small fruits, cherries, pears and peaches are suffering on account of the heavy rains. Wheat within the last month shows very badly from the Hessian fly, and some farmers where it looked fine one month ago, now say that if they were sure of their seed back they would consider themselves lucky. This remark was made by one of our best farmers who has 40 acres upon the ground. J. B.
Albion, N. Y.

JUNE 7.—The fruit in this part of the country is blighting or falling off badly, particularly the apples, prunes and plums. Cherries have set better and now bid fair for a full crop, many trees being heavily loaded with fruit. Of course, it is a little early to predict with certainty yet. My best judgment is that there will not be over from one-third to one-half crop of apples and plums. I have been through three towns in Wayne County and find the same condition of things there as here. Peaches in that county are falling badly and the trees are so badly affected by the curl-leaf that they will lose a large part of the foliage. Corn about half planted. The fly is working in wheat very badly; one-half of the crop will hardly be worth harvesting. Grass, oats and barley are doing well. M. M.
Port Byron, N. Y.

JUNE 8.—The prospect is for a light apple crop, especially Baldwins. Plums and cherries have only moderate crop set. Peaches on old orchards are a failure. Young orchards are very good where the curl-leaf has not dropped them. Sprayed orchards are free from curl.
Kendaia, N. Y. J. H. H.

JUNE 9.—Greening and almost all early apples blossomed full (hardly any Baldwin or Spy). The opinion of the growers in this section is that from one-half to two-thirds of the blooms have set fruit, as the result of wet and cold. Pears, plums and cherries promise a good crop, also berries. Strawberries will not be ripe before June 20. Potatoes are being planted now; will not all be finished this week. Grass and oats look well.
Ionia, N. Y. A. L. B.

JUNE 10.—The green louse has not appeared on peas in the gardens, but there are quite a good many on wheat. All crops are looking fine. Wheat should average between 25 and 30 bushels to acre. Corn is looking well, only backward. I have one field of potatoes with rows shut and white with blossom. S. H. D.
Warwick, Md.

JUNE 10.—The general opinion in this locality is that the apple crop will be light. Although we have had but little heavy rain, we had during the time of blossoming a continuous spell of wet weather, and some damage has been done. My own orchard has set fruit fairly well wherever there were blossoms. The wheat crop, which looked very fine a few weeks ago, is likely to be very near a failure, owing to the work of the Hessian fly; some fields are being plowed up for beans or other late crops, and more would be only for the seeding, which looks well. Oats are looking very well at present. Barley on high land is also good, but on low land is turning yellow from too much water. Corn is not nearly all planted yet; some that was planted early is coming up but looks yellow (too wet and cold); some does not come up. A good many sugar beets have been sown, and they seem to stand the cold and wet very well. Strawberries and small fruits are looking well, but very backward. We are hoping for more favorable weather and better prospects. F. E. V. E.
Stanley, N. Y.

JUNE 10.—The reports of favorable crop indications need revision. Lot of hay if we can get it cured; much ground yet unplowed. It will be too late for corn unless the September frosts hold off. Too wet for potatoes, etc. Cold rain caught the pear blossoms, and washed our pollen; crop will be below average. Rain spoiled half the crop of sweet cherries. Peaches and plums hold on well and need thinning freely. Ravages of worms worse than last year. J. Y. P.
Columbia, N. Y.

JUNE 10.—Cold rain has injured the prospects for a good fruit year in this section very much. Pears, plums and cherries have set very poorly. Peaches are considerably affected with curl-leaf. Baldwin apple trees as a general thing did not bloom. Other varieties had a moderate bloom. The cold rains have not affected the set of apples as far as I can discover. My Baldwin trees blossomed fairly well, and are well set for a moderate crop. A. E. B.
Brighton, N. Y.

JUNE 11.—Plenty of corn and potatoes yet to put in, and some soil hardly fit to work this week if we had no more rain, but the rain continues to-day. Yesterday was the first pleasant Monday we have had in three weeks. A small piece of rye was cut to cure for feed three weeks ago, and yesterday it was, by constant moving, dry enough to draw in. Some are trying to work the corn. Potatoes that were in early look well for the cold wet weather. Oats and barley have a good stand on dry soil; much drowned out, and quite a little put in very late. Wheat is suffering badly from the effects of the fly. Many pieces that looked as if they might yield from 25 to 40 bushels per acre will hardly be worth the harvesting from the present outlook. Grass has grown quite finely but is now almost a standstill. Hay will not be more than a half crop; old meadows thin and in many places very light. Where a good stand of new seeding was secured it looks fine. On the whole the outlook for the farmer is not so bright as one year ago, for many who depend upon the corn crop for fodder, unless uncommon weather follows soon, must be short. Small fruits are promising; apples about one-fourth crop. Early apples setting full, but late varieties light; no Baldwin of any account. Gardens where planted early are looking quite well; many to plant yet.
Cayuga Co., N. Y. A. D. B.

Western Crop Notes.

The stock of old hops on the Pacific coast is nearly cleaned out. The indications are that the yield for Oregon this year will be 90,000 bales, and that the crop for the three coast States will aggregate 170,000 bales.

The vineyards in parts of northern California have been damaged by frosts, and in some sections there will be only half of an ordinary crop.

The apricot yield of southern California is large, and it has escaped frost and hail damage. The canning factories will be in full blast by the latter part of June.

The live-stock trade of Washington is said to be the most active for a long time. The demand for beef for the Klondike and the increasing business with Asia are the causes.

The official reports from Kansas state that the condition of wheat has declined 17.8 per cent since April 5. This is owing to drought and insect pests. The acreage is not far from that of 1893 (5,110,873 acres), which was the largest on record. The corn acreage is half a million less than that of last year, or 6,400,000 acres, and its present condition is decidedly inferior to that of a year ago.

Government Crop Report.

As a rule conditions have been highly favorable during the past week in all sections east of the Rocky Mountains. The Spring wheat region has had abundant rains, which have also been quite general over the central valleys. Corn is coming on slowly, and needs warmer weather. Some frost damage to corn is reported in the extreme north. The Hessian fly is active in the Winter wheat. Harvest has begun in North Carolina, Tennessee and Kansas; and the Maryland and Virginia fields will soon be fit to cut. In the North Central States the oat outlook is promising, but the rains came too late to help this crop in Missouri and Arkansas. Cotton is backward and making slow growth. Some fields in North Carolina have such a poor stand that they are being plowed up for other crops. Winter apples are dropping badly, except in New England, which at present promises a fair crop. Farmers in the Atlantic States are hurrying along their work as rapidly as possible in an effort to make up for the time lost during the rains. Hailstorms in central New Jersey have damaged fruit and vegetables and caused grain to lodge badly. Sugar cane and rice in the Gulf States are doing well.

Mark Lane Express says that the English hay crop will be below the average, owing to dry weather. Also drought and rust are making havoc with the wheat crop in Austria. Indications from the wheat districts of France are most favorable.

The five days preceding May 23 were very cold and cloudy and some rain fell. May 23 and 24 were mostly clear and seasonably warm. On the evening of May 24 we had a thunder shower followed by five days of cold rainy weather. May 29 was the only day that a great amount of water fell. A local paper says that more water fell during six hours of May 29 than fell during the six months from May 1 to November 1, 1900. Another shower June 1, and still another June 2. The earth is well soaked, but I believe it needed it all. We have had an abundance of rain since the middle of March.
Vail, N. J. G. G. S.

Woman and Home

From Day to Day.

THE OLD MAN'S VIEWS.

Back there in the old days when 'pendicitis wasn't known,
Feller'd git to feelin' bad, an' git kind o' out o' tone,
"Doc" ud waltz right in an' say: "Got a fever? Had a chill?
Well, this weather's kind o' bad! Rest awhile an' take a pill!
Be all right to-morrow, Joe!" Stop an' joke some with the kid.
You'd be out the next day, sir, ploughin' like you never did!

Feller gits a chill to-day—Ge-mu-nee! The doctor comes,
Stands an' feels your pulse an' then shakes his head an' haws and hums:
"Gravest symptoms—system is thoroughly run down, I fear;
Sorry, sir, but there's some signs of appendicitis here!
See you in a day or so!" Then a feller lays in bed,
An' appendicitis comes from the worry in his head!

That's the way it seems to me—science is a mighty thing,
But when ignorance is bliss, let's be ignorant, by jing!

—Indianapolis Sun.

NICKELS worn smooth by much handling are recommended to remove paint spots from glass. The spots can be scraped away without any risk of scratching the glass.

*

A CEREAL kitchen at the Pan-American Exposition will be under the management of Miss Emma C. Sickles, secretary of the National Pure Food Association. All sorts of cereal foods will be offered at the kitchen, and demonstrations of their proper cooking will be given.

*

AN Ohio correspondent advises the following mode of preparing prunes, instead of the ordinary boiling: "Wash the prunes, and pour over them enough boiling water to cover. Stir occasionally. Serve in 12 or more hours without or with sugar. I use no sugar. These are better than any cooked prunes I have ever eaten."

*

ONE of our friends has developed a new plan—new, at least, to us—of raising money for a charitable object. It is called the calendar plan, and is as follows: The organizer is called the year. She appoints 12 persons as months; each month selects four weeks, and each week seven days. Each person described as a day promises to pay a stated sum—it need be but one or two or three cents—every week, handing this over to the person who is her week. The week keeps track of her days, and hands the money over to her month, who in turn reports to the year. This plan is free from the endless exasperation of the endless chain, but like a sum in arithmetical progression, it mounts up to a very respectable sum. The accounts can be turned in monthly, the weeks being responsible in keeping the days from getting into arrears, and the responsibility is so divided that it does not fall too heavily upon anyone.

*

WOMEN'S shoes show some differences in shape this year, one of the most noticeable changes being the gradual adoption of the Cuban or military heel. The Cuban heel is straight at the back, and does not taper from shoe to ground, being of about the same size from top to bottom. It is not very high, yet it looks high. The military heel is like the Cuban, but is a little straighter and a little higher. It was hard to grow used to these straight heels at first; now that we are accustomed to them, the curved heels look old-fashioned. Among low shoes for Summer wear the Priscilla is the newest; it is the counterpart of those worn by Puritan maidens. It has a high tongue upon the outside, fastening under a broad buckle, and rather high square heels. It is a very becoming shoe. Pigskin shoes are offered for golf and athletic wear, in place of russet leather; they are rather light in color, and usually stitched in black. While the toes of this season's shoes are not so strongly rounded as last year, the whole shoe is broader. Perhaps we are

3819 Woman's Cape
34, 38 and 42 in. bust.

all growing more sensible as regards our shoes; certainly the average shoe salesman now does not hesitate to tell his customer if she is trying to wear a size too small, and the adoption by manufacturers of the so-called French numbers prevents the buyer from having any clear knowledge of her size. Such a number as A-44597, or some similar mystery may convey an idea to the shoe man, but certainly not to the customer.

*

A PHILADELPHIA doctor, in a paper recently read before a medical society, said: "I attribute the enormous increase of appendicitis among women to golf, cricket, the bicycle and other outdoor sports, which at times subject them to prolonged physical exertion and inclement weather." This view is evidently different from that of the old man who thinks this disease comes from the worry about it. The change produced by the modern woman's athletic tastes was well expressed by an old farmer in Maine, who gave some Summer visitors permission to use his pasture land as golf links. The old hired man, scandalized by the sight of tall, athletic girls in scarlet coats, armed with iron-hoofed clubs, striding over the fields, one day reported to his master:

"Them girls in the pasture scare our cows!"

The farmer scratched his head. "Hiram," came his leisurely answer, "times is changed since we was young. Used to be the cows scared the girls!"

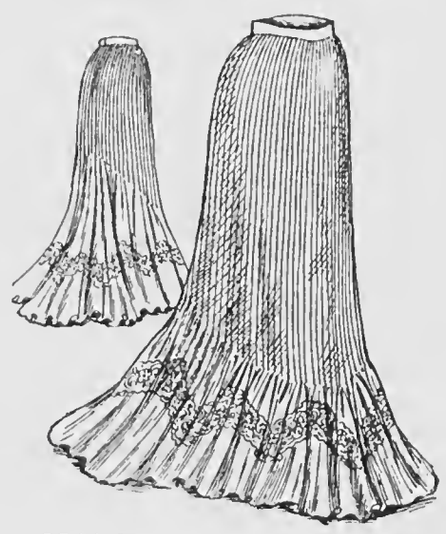
The Rural Patterns.

The Directoire cape figured is of black taffeta lined with white satin, trimmed with heavy cream lace, and with ties of white chiffon. The under or foundation cape is dart-fitted and extends well over the shoulders and is trimmed with the four tiny bias frills. The outer cape is shorter and plain about the edge and is trimmed with the lace appliqué only; while the big revers turn back and are faced with the lace and edged with a single frill. At the neck is a deep turnover collar that meets the revers to which the chiffon ties are attached. If a plainer effect is desired the outer cape can be omitted, the under alone made from either silk or cloth, tailor-stitched, or trimmed as simply or as elaborately as one may choose. To cut this cape for a woman of medium size 2½ yards 21 inches wide or 1¼ yard 50 inches wide will be required with 1⅝ yard of lace appliqué, ⅜ yard of all-over lace, eight yards of ruffling two inches wide, one yard 1½ inch wide for revers and 1½ yard chiffon for ties to trim as illustrated. The pattern No. 3819 is cut in three sizes, large, medium and small; price 10 cents from this office.

The tucked skirt shown is of blue barège trimmed with cream guipure. The skirt is circular in shape and is tucked on parallel lines to the indicated point, where they cease and the material falls free to give the flounce effect. To cut this skirt for a woman of medium size 9¼ yards of material 21 inches wide, seven yards 27 inches wide, 6½ yards 32 inches wide, or 4½ yards 44 inches wide will be required. The pattern No. 3811 is cut in sizes for a 22, 24, 26, 28 and 30-inch waist measure; price 10 cents from this office.

Household Expenses.

Very interesting and suggestive are the accounts in a recent issue under this head. I have studied the last one—a family of two grown-up daughters with mother and father, whose food, firewood, coal and clothing amounted to $334.19 for one year. The insurance and taxes are not in the account, nor the amount of money given to charity. Let us guess that these would swell the amount of expenses to $400 a year for the four. We will count the son out, as earning his own living. Here is a family dwelling in a home, owned, with six acres of land, most all down in grass. There is no evidence that the land brings in anything. They pay out money for milk. Where are the expenses for butter? Where are the traveling expenses of these girls or their parents? Where are the expenses for books or periodicals? It only cost $37 for the four for clothing in a year; they did not weave the cloth, either. Yet they say "We manage to look as well as people who buy new clothes continually." That may seem so to them, if they never go out far and see how others dress. How would the old gentleman feel if he had a tailor measure him properly and clothe him with a pair of trousers costing $10? I think he would feel lively and spruce, and it might ease up his lameness some. Well, this is no joke, I assure you, when you face this whole



3811 Tucked Circular Skirt,
22 to 30 in. waist

problem. There are two sides. This family requires $10,000 at interest at four per cent to get this income. I am not saying they have, but the facts require it. Now that $10,000, in order to bring them an income, is used by men who wear fine clothes, who travel, are well informed and see much life. Maybe it might be in the hands of some other poor farmer who stints, while his wife slaves, and they see nothing but a grind. Alas! we have need to check such tendencies and lift up men to enjoy life. Or it might be in various kinds of business, either of making clothes or shoes, or railroads, or some occupation which calls for activity and intelligence and the enjoyment of a larger and varied life and work.

Now which would you rather be, the ones who have to earn that interest, or live back, like them out of sight, and out of the enjoyment of a larger life? Nine out of ten will answer: "Give me the chance to labor and enjoy life, and let those who want to cramp their lives and that of their children, do so." For, say they, the tendency of the times is right which makes it a duty to spend money, to use good clothing, live comfortably, and keep persons—all of us—in comfortable labor. We do not mean sweatshop labor, but is not stinting in the country as bad as sweatshop labor in the city? Both are wrong and condemned by the common sense of your children, who believe it proper to see and enjoy life since the steam of the kettle has got out from under the lid, and can carry us thousands of miles. Rely upon it, our children do not want to hang around a home just to keep the teakettle boiling; no, not in these times. You have to dress up the boys if you want to keep them on the farm. Listen to what the boy says, when once well out from the home on the farm—that is, some farms, where stinting is the rule:

"Kind as Mother is, she cannot see clearly when she says her make of clothes fit and are good enough for me. I know they do not as soon as I get into town. And I know I deserve good clothes when I earn them by my labor. But as to Father, he allowed her to make his clothes, he was gentle, liked them roomy—easy to take off and put on. Kind, dear old man, but they bagged, not in the knees only, but all over him. And I wonder if that was the reason he hid from the activity of life. Ah! who knows? I will draw a veil over this and I only say it to myself."

JAY.

Some Seasonable Recipes.

We are using dried Gravensteins for pies, which leave nothing to be desired as to quality. A visitor asked if those were cherry pies; and perhaps my wife's original rule for this and other things may be appreciated. A large handful of dried apples is cooked quickly in a tightly-covered granite basin in a little less than a quart of water. Six halves of dried apricots are cut fine and cooked in very little water. Fill in the apple, then the apricot, together with water they were cooked in; add a small cupful of sugar, and nutmeg.

Here is a lemon pie, in eating which a visitor casually remarked, with due praise, that he never ate pie plant. Two cupfuls of rhubarb, chopped and scalded, preferably the stalks whose leaves are still crinkly. This water is turned off. To the rhubarb is added a cupful of sugar, tablespoonful of flour, a beaten egg. Bake in single crust, and cover with beaten white of egg when cold.

The following rule for canning is a decided improvement upon pineapple alone, and the rhubarb taste disappears. Chop and cook equal parts of pineapple and rhubarb, and add a cupful of sugar for each pint jar.

This is for chicken fritters no guest will consider that he fritters away his time upon. Two cupfuls chopped cooked chicken meat, one cupful strained tomato, three rolled crackers, one-half cupful of chicken broth, a pinch of salt, a grasp of black pepper and a speck of red pepper. Make into cakes and fry.

Rural Recipes

Pray, what is "Health Food?" Is it not
The fancy name we call
All sorts of thing that haven't got
The slightest taste at all?
—Catholic Standard and Times.

Prune Short Cake.—Make a short cake, using a regular biscuit crust or a short cake batter. For the prune filling wash a pound of prunes, thoroughly cover with cold water and let soak for 24 hours. Then put prunes in double boiler, water and all, and let cook slowly until perfectly tender. Slice a couple of lemons very fine and add to the prunes when half done. Drain off the juice, add half as much sugar and boil to a thick syrup. Put the prunes into a colander and mash with a potato masher so that the pulp will go through and the stones and skins remain. Add syrup and spread over cake while both are warm. Serve with or without cream.

Ice Cream Cake.—Stir one cupful of butter and two cupfuls of sugar to a cream. Add three level teaspoonfuls of baking powder to two cupfuls of sifted flour, add also one cupful of cornstarch and sift again. Add this alternately with one cupful of milk to the creamed butter and sugar, add one teaspoonful of vanilla extract; finally lightly and thoroughly mix in the stiffly-beaten whites of eight eggs. Divide the mixture evenly among four jelly-cake pans and bake in a moderately hot oven 10 to 15 minutes. For the icing, shell and cut in pieces enough pecans to weigh four ounces. Make ready also four ounces of raisins cut in pieces and weighed after being seeded. Cut four ounces of citron in small thin strips. Put 1½ pound of sugar into three-quarters of a pint of boiling water; boil without stirring until clear and thick—it should pour from a spoon in a continuous thread. Pour this hot syrup slowly on to the beaten whites of four eggs and stir until cool. Build the cake with this icing between, sprinkling the mixed pecans, citron and raisins over the icing on the three inner layers and pressing all down gently. Ice the top without the fruit.

Cracked Wheat Muffins.—Two cupfuls of cracked wheat; soak over night in two cupfuls sweet milk; add one teaspoonful of salt, one tablespoonful of sugar, the beaten yolks of two eggs; beat vigorously, fold in the stiffly-beaten whites, and last add one rounding teaspoonful baking powder; bake in well-greased muffin tins in hot oven; break open; do not cut.

Ham Croquettes.—One cupful cooked ham chopped, two cupfuls mashed potatoes, one tablespoonful butter, yolks of three eggs, a dash of cayenne; mix the hot mashed potatoes, butter and yolks of two eggs with the cayenne; beat until smooth and turn out to cool; put the remaining yolk with the ham in a frying pan and stir over the fire for one minute; remove, and when cool form a ball of the mashed potato, pressing into it a large teaspoonful of ham; fold the potato over it, roll in egg and crumbs and fry.

Cabbage with Cheese.—Cut the cabbage in good-sized pieces. Put one piece at a time into rapidly boiling water, having added a tablespoonful of salt and one-fourth teaspoonful of soda. Boil rapidly without covering for 25 minutes. Turn in a colander, drain and cool. Then chop. Make a sauce of one tablespoonful of butter and flour each, one cupful of milk, saltspoonful of salt and a dash of cayenne. Spread a layer of cabbage in baking dish, cover with sauce, then a layer of grated cheese; repeat, and on top place a layer of crumbs which have been rolled in butter. Bake until the sauce bubbles through the crumbs.

Egg Rusks.—The ingredients for this delicious tea bread are seven eggs, a pint of boiled milk, one quarter pound of butter, one-half pound of sugar, two pounds of flour, a saltspoon of salt, and a pint of flour into which a half teaspoonful of soda has been sifted. Beat the whites and yolks separately and as lightly as possible. Into the boiled milk drop the butter and sugar, and after mixing thoroughly add the flour and yeast powder, and lastly the eggs. Put in a warm place to rise, and when light add the pint of flour and soda. When risen the second time, make into small rolls, wipe the tops over with the white of an egg, sprinkle sugar and chopped almonds over them, and bake a light brown.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

When Apples Were Scarce

A writer in the American Kitchen Magazine gives the following suggestion for the use of dried apples:

The children were hungry for fruit; but the apple crop, usually the mother's main resource, had been a failure that year. Apples were extremely high, and, in fact, hardly to be obtained at all. Oranges and bananas in sufficient quantities to supply her large and voraclous flock were quite beyond her small means, and she had been unable to can much fruit that year. What should she do? One day she saw at her grocer's some very white evaporated apple. By a sudden inspiration she thought she saw in it the answer to her question. She bought a pound, which cost her only 10 cents. That night she put the apple into a preserving kettle with plenty of cold water. In the morning it was soft, and the slices could be easily separated and washed. With a sharp knife she carefully removed all brown spots and tough seed cases. Then she added a cupful of seeded raisins and put the whole into fresh water, stewing it slowly until it was reduced to pulp.

After filling her pretty glass fruit bowl with the sauce, she put the rest into pint jars. "I'll fix up this bowlful for the children's lunch," she thought, "and if they don't like it, I can use the rest for pies." First she sweetened the sauce to taste; then she flavored it generously with fresh, fragrant ground cinnamon, and setting it on the table with plenty of good bread and butter, and a plate of little scalloped cakes, she called the children to lunch. They came trooping in, hungry, expectant. The new dish was quickly spied. "What is it, Mother? Apple sauce! And oh! goody, goody! raisins in it!"

They began to eat. There was no sound but the clatter of knives and forks responding briskly to the "hurry call"; but by-and-by one fresh young voice and then another rang out in eager demand: "*More* bread and butter and apple sauce, please, Mother. It's *good!*" And the mother smiled happily upon her contented young brood, and thought, "How easy it is to please them after all. One doesn't need to have much money—just a little loving thought."

The Children's Playhouse.

The three little girls who owned the playhouse thought it the most delightful spot in their little world, and it truly was a charming place. It had been built in less than a day, and did not cost a cent. Two posts seven feet high and two six feet high, firmly planted in the ground, made the framework, with a board roof for covering. The posts were nine feet apart, making the playhouse three yards square. On three sides narrow boards were nailed about two feet apart to the posts to support the vines with which the house was covered, but the front had a wide open space for a door with vines on each side. As the house faced the north the hot sun could not stream through the door. Over the roof was thrown a big square from a binder cover to keep out the sunshine that peeped through the cracks. A tight shingle roof would have been better, but the house had to be built of odds and ends of lumber, for the family was far from rich. The east side was gay till noon every day with purple, pink and blue morning-glories, while the west side was one mass of buff and pink sweet-scented honeysuckle that effectually shut out the sun's rays and filled the air with fragrance. The south side had gourd vines with pretty shiny gourds, big and little, nestling among the green leaves. There were dipper gourds, Job's tears, and half a dozen other kinds, for a package of mixed seeds had been planted in the rich soil and carefully tended by little hands. On each side of the door hop vines rustled their green bells through the long Summer days and furnished a big sack of the light feathery balls for yeast and poultices in Autumn.

Two low trestles supported a table made of pine boards, and this with a cupboard made of starch boxes furnished the playhouse, except the little chairs, which were carried from the house in the morning and taken back. Each little girl had a flat peach basket to put away her doll, work basket and doll clothes in when through playing, and these were stored in the kitchen closet when not in use, so habits of neatness were soon established by the mother. Friends and relatives had kept the playhouse in mind at Christmas and birthdays, so the small cupboard held a generous supply of small mugs, plates and dishes. There were gay little dinner parties within the four green walls, at which the children took turns playing hostess, sewing classes with Mamma for teacher, and many a delightful hour for reading stories and playing games. I am sure these fortunate children will always think some of their best and happiest hours were spent in the cool little playhouse, and I am sorry there are not hundreds like it for country children scattered up and down the United States.

Laundry Conveniences.

An ironing table ought to be high enough for the ironer to bend her elbows at right angles and work without stooping. In reckoning the height allow for a thick mat or excelsior cushion under foot, says Emily Holt, in Kansas City Star. It is a great economist of strength and backaches. Pick out sound deal, free of knots or warping, and see that the drawer works easily. To furnish the table properly take first a soft, coarse, all-wool blanket, fold it by a warp thread, lay the fold upon a long edge of the table and make very smooth, then trim all round, save at the fold, exactly as it lies, first making sure that the underside is as free of wrinkles as the upper one. Cut a four-inch square of stout muslin for each corner, double the squares to triangles and sew them fast. Their use is to slip over the corners of the table, thus holding the blanket in place. When the blanket is washed take off the squares and remove the whipping from the edges. Make ironing table covers of unbleached sheeting. Cut them three inches bigger than the table top, all round, hem the edges narrowly and miter three of the corners, sewing them fast; then in the double work a couple of eyelets either side and lace a tape through them. By tying this tape tight after slipping the mitered corners over the table corners all need of pins is done away with and a firm, smooth, unwrinkled surface assured.

Cover skirt and sleeve boards the same way—first the double woolen cloth sewed firmly on, then with removable muslin slips, hemmed at the small ends and laced snug over the large one. Fit under and upper covers well, so either side can be used. A bosom board is a necessity in doing up shirts. It should be also square, of very thick cardboard, covered four-fold with flannel. If there are many children to iron for a small size shirt board and several sizes in sleeve board soon pay for themselves in saving time.

Provide the ironing table further with either a light trivet or asbestos mat to hold the irons, a clean wiping cloth, a shallow wooden box with salt for rubbing a rough iron smooth, a smaller box for either white wax or white soap, and at least three clean, soft holders. In addition, furnish the laundry with a folding clothes horse of white wood, which may be turned into a screen as clean clothes are hung on it; a big starch kettle, agateware or copper or block tin; several cheese cloth strainers and at least three sheets of cheesecloth to cover the clean clothes while they air after ironing.

WEALTH and rule slip down with fortune,
as her wheel turns round;
He who keeps his faith, he only cannot be
discrowned.
Little were a change of station, loss of life
or crown,
But the wreck were past retrieving if the
man fell down.
—James Russell Lowell.

A GIRL cannot too sedulously guard her, if the mother has reached a period where she is more easily wearied than formerly, and where little things vex her. To some of us there come days when our hearts are heavy because we were not so sweet and loving as we might have been, and God alone can help us when this realization comes too late.—Margaret E. Sangster.

BUSINESS BITS.

THE tools used by Geo. M. Clark in preparing the ground which yielded the record breaking crops of hay are made by the Cutaway Harrow Co., Higganum, Conn. A mower knife grinder is also one of the products of this factory. It is impossible to heat the knife with this grinder if directions are followed.

A WELL-DRILLING outfit makes a profitable investment for anyone inclined to do this line of work. Keystone Driller Co., Box U, Beaver Falls, Pa., makes a complete and compact outfit for drilling water wells, oil or gas. A 75-page catalogue will be sent to anyone interested.

WITH the prospects in sight for the largest hay crop in many years, farmers will prepare to have their machinery in first class order to handle it. No small expenditure will facilitate haying more than the purchase of a good grinder for the mower knives. Ross Bros., Worcester, Mass., offer one in this issue.

The Southern Potato Crop.

No early potatoes grown for shipment in this section, although about double the usual acreage has been planted and the crop is in good condition. R. M.

Saxon, N. C.

The potato crop is very fine this year; has not been injured by the weather. The stand is over an average; tops are looking better than they have for many years, and bids fair for a good crop to this date. Tubers are about the size of hull walnut to a hen's egg. T. P.

Cape Charles, Va.

The usual acreage of potatoes, not very large, was planted, but the earliest are a poor stand, many having rotted, and the crop was further injured by frost on May 1. Later planted ones not up at that date are now much the better, and the crop will perhaps be an average one. I planted four bushels of Early Rose whole last Thanksgiving Day; they did not come up any earlier than February planted ones, but they grew faster, and I intend to try that again with cut potatoes. F. N. P.

Pocomoke City, Md.

The outlook is for a very poor crop. The weather has been very bad, raining almost continuously since March. The acreage has been about as usual, which is small in this section. In fact, the outlook for anything but grass is very poor in this country. J. E. C.

Greensboro, N. C.

There is about the same amount of Irish potatoes planted here as usual, and the crop is about 50 per cent better than usual, owing to the rainy Spring. However, our crop cuts no figure in the market, as potatoes do not do well here, and are only raised for local use; in fact, our Winter supply always comes from the North. This county, or rather this part of it, is best adapted to fruit. Sweet potato acreage about as usual, but it is early to predict the crop. J. D. S.

Leavitt, N. C.

So far as I have seen the prospect for a good crop of early potatoes is very encouraging. Many lots of them are in full bloom, and there has been ample rain (still coming down) to make them bear well, if we can soon have some genial sunshine. The number who grow potatoes for market in this section is very limited, as they find more money in tobacco than in potatoes. Strawberries are large and abundant, but are rotting badly for want of sunshine. J. E. C.

Drayden, Md.

More Oleo Rogues Caught.

The Metropolitan division of the Department of Agriculture, State of New York, reports the following list of oleomargarine violations and penalties imposed:

Chas. Umla, 3 Alabama Ave., Brooklyn, $25 and costs.
Louis Seifert, 812 Grand St., Brooklyn, $100.
John D. Behn, 865 Liberty Ave., Brooklyn, $100.
Behn Bros., cor. Crescent and Welden Sts., Brooklyn, $100.
Fred N. Muller, 273 Avenue A., N. Y., $25 and costs.
Richard F. Cunneen, 317 Bowery, N. Y., $50 and costs.
Ernst Schwaneman, 1856 Park Ave., N. Y., $25 and costs.
John Murphy, Brooklyn, N. Y., $25 and costs.
Michael Moriarty, 116 Greenwich St., N. Y., $50.
Wm. Seifert, 285 Smith St., Brooklyn, $50 and costs.
Peter Johnson, 40 Jackson Ave., Brooklyn, $25.
Harry Harris, Jersey City, N. J., $100 or 90 days in jail.
Edward Brock, Jersey City, N. J., $100 or 90 days in Catholic Protectory.
George Warren, Jersey City, N. J., sentence suspended.

In this list are three wagon cases of New Jersey peddlers of oleomargarine who were detected selling same in this State. It seems to be a new wrinkle for the Jersey men to send their wagons into this State in charge of small boys. This is probably the result of the recent heavy penalties and term of imprisonment inflicted upon the wagon men, so that they are now unable to secure men for their wagons, and are resorting to the method of putting small boys in charge of them. However, the court, taking a reasonable view of the matter in the case of Edward Broek of Jersey City, who was detected selling oleomargarine, he being a small boy in knickerbockers, and while at first inclined to suspend sentence, imposed a penalty of $100 or 90 days in the Catholic Protectory. In the case of George Warren, Jersey City, another peddler, sentence was suspended for the reason that his employer had been detected selling oleomargarine and is now serving a three months' term in jail, the court feeling satisfied that they had reached the principal in this case.

STATLER'S HOTEL

BUFFALO, N. Y. **Largest in the World.** 300 feet from the Main Entrance to the Exposition **$2 and $2.50** For lodging, breakfast and evening dinner. Rooms with bath extra. Send for free maps and folder, telling about our Guaranteed Accommodations.

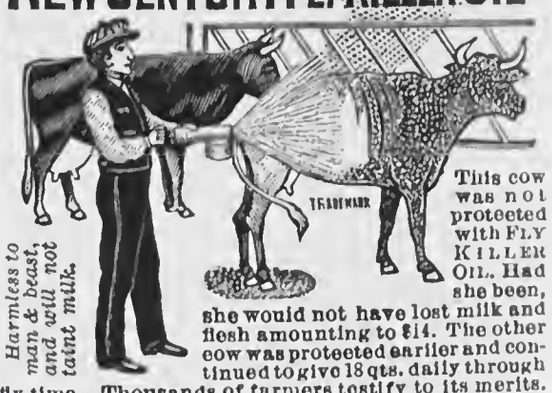
NEW CENTURY FLY KILLER OIL



Harmless to man & beast, and will not taint milk.
This cow was not protected with FLY KILLER OIL. Had she been, she would not have lost milk and flesh amounting to $14. The other cow was protected earlier and continued to give 18 qts. daily through fly time. Thousands of farmers testify to its merits. Send $1 for a Sprayer and enough Oil to protect 150 cows. Ag'ts Wanted. D. B. Smith & Co., Utica, N. Y.

EVER MADE THE TRIP?

While it has always been a beautiful trip over the Lackawanna Railroad to Buffalo, yet the fact has not been so generally known as it has of late, and the result is that the increase of traffic is very large. One of the most talked-of pieces of scenery is the Delaware Water Gap, and it would pay any one who has never made the trip to Buffalo by way of the Lackawanna to take it and view this beautiful spot. Another great advantage is the shortness of the route. It is a fact that the Lackawanna is the shortest road to Buffalo.—Insurance Times.—*Adv.*

The New Horticulture

BY H. M. STRINGFELLOW.

We do not hesitate to say that this is one of the most interesting books on horticulture that ever was printed. Most reading farmers have heard of the now famous "Stringfellow Method" of planting trees, but few understand clearly what it is. This book tells the whole story in clear-cut, forcible style, which all can understand. Not only is the theory of close root-pruning carefully explained, but the general principles of gardening and fruit-growing are discussed. Mr. Stringfellow is a practical gardener, and he gives his own experience. We commend the book to all without reserve. New Edition, paper covers, 50 cents.

THE RURAL NEW-YORKER, New York.

BOOK BULLETIN

For Sale by The Rural New-Yorker

THE Spraying of Plants, by E. G. Lodeman. Full particulars about the science and practice of spraying for insects and fungus diseases. Price, postpaid, $1.

BUSH Fruits, by Prof. Fred W. Card; 537 pages; full descriptions of varieties, methods of propagation and handling, treatment of diseases, etc. Price, postpaid, $1.50.

MY King and His Service, by Frances Ridley Havergal, well known as a writer of devotional books. We have a few copies of this work beautifully bound in red and silver. Price, postpaid, 15 cents.

FEEDS and Feeding, by Prof. W. A. Henry; 657 pages, giving in detail the analyses and relative values of feeds, and best methods of feeding live stock. The best work on this subject that we know of. Price, postpaid, $2.

THE RURAL NEW-YORKER,
409 Pearl St., New York.

Market Briefs

PICKED UP HERE AND THERE

STRAWBERRY VS. ORANGE.—The orange is feeling the effect of the large quantity of cheap strawberries on the market, and prices have taken a decided tumble. This is to be expected, and the figures for oranges from this time on will be more or less affected by the various Summer fruits. The drop in price, however, will put the fruit within the reach of many new customers, and thus sales will continue heavy.

LEMON TRADE.—Of course, there is a regular demand for lemons the year around, but an increased Summer trade is always expected, and the ups and downs of this Summer business usually follow very closely those of the thermometer. Most restaurants now furnish lemonade, and in hot weather many patrons take it in preference to tea or coffee. During a long period of hot weather, lemonade stands spring up around the streets like mushrooms.

NEW POTATOES in large quantities are arriving from the South, and prices have declined. In one day this week 8,000 barrels came from the South. Prices run from $1.75 to $3.50. Many of them are of good size and quality, but, like all new potatoes, look bad on account of the tender skin being knocked off. It will be well for shippers to keep in close touch with their markets, so as not to overdo the business and create a surplus that will result in disastrous prices. It is very easy to overstock a market with perishable stuff in hot weather; and, like an animal that has been cloyed by overfeeding, some time is required to get over the effects of such a mistake. Only a few days since the local board of health condemned 1,500 barrels of southern cabbage that had been here too long.

UNRIPE BANANAS.—It is in this condition that they are usually sold and eaten. Those that are intended for shipment to this market are picked green as grass, and many of them are in this shape when unloaded from the steamers. If shipped when too near ripe, they are likely to spoil on the way, melting down in the hold of the vessel into an indescribable mass of rottenness. Great loss is also experienced from this cause when vessels are detained by accident or storm. But few people, however, seem to know that a banana is not ripe enough to be fit to eat until the skin is more or less brown and discolored. As a general rule buyers appear to think that the speck on a banana skin makes the fruit unwholesome, as it would an apple or orange, and they reject all such. The banana peddler has to sell the thoroughly ripe fruit at almost any price to get rid of it, and people go on buying the green bananas which are really raw and to some extent indigestible. More red bananas than usual are seen this year. They cost more, and are more highly nutritious than the yellow ones.

NEW MILK PRODUCT.—It is not really new, yet not at all well known here. Koumiss has been made for a long time in eastern countries, and as prepared there is an intoxicating drink. It is merely fermented milk. It, however, can be made so as not to be intoxicating, and an increasing trade is being worked up in it in drug stores and dairies in this city. When more people learn its value as a Summer drink, this business is bound to increase, and a trade that puts a new value on the product of the cow must be a benefit to the farmer. Some people whose stomachs rebel against milk in any other form, can use koumiss. What to drink in hot weather is not a troublesome question for those who have plenty of pure spring water at hand. As it bubbles up through the gravel or slate rock, one many drink as much as he wishes without harm, and thirst is satisfied, but the reservoir water with which most cities are supplied is a different article. Those who live among these brick walls and pavements during long periods of hot weather are often troubled with a distressing thirst which is difficult to satisfy. Iced city water does not do the business; soda is only an aggravation; and lemonade and cold tea seem to be the most satisfying of ordinary drinks. From repeated trials the better brands of koumiss have been found the most satisfying for this purpose, and it has the further merit of being a food as well as a drink. It has a little of the flavor of sour buttermilk and enough snap and sparkle to make it palatable. It would seem as though some of the dairies which have large plants in the country and supply private customers here, might well boom this trade. If once thoroughly introduced, so that people learned its value, there would be a steady demand for it, as it has all the desirable qualities of the best buttermilk, is much more nutritious, and can be used without harm by those with weak stomachs. W. W. H.

FRUIT IN THE LOWER HUDSON VALLEY.

A Trip Among Growers.

Last week I took a drive through the Hudson River fruit section from Newburgh south as far as Mountainville. I have never before found strawberries so backward at this time in June. The effect of cold wet weather is apparent. For the most part the crop is lacking in foliage, and there is considerable blight, showing lack of fertilization caused no doubt by the excessive rain. There are, of course, some exceptions to this general rule. The Bubach on T. J. Dwyer's grounds at Cornwall is everything that could be desired. I rarely see a more vigorous plant or a stronger or richer foliage than in his field planting of this variety, and the promise of fruit, while possibly a week later than usual, is certainly most encouraging. William Belt on these grounds is also in good condition, and most promising for a fruit yield. But Glen Mary, Brandywine, Cumberland, Triumph and some other varieties have not the growth of foliage nor promise of fruit that the rich condition of the soil and evident care would lead one to expect, and which is usually rewarded on these grounds. At the Phieffer fruit farm near Mountainville, where strawberries usually are at their best, I saw the same conditions—light foliage and blight. At Cyrus Shaw's place at Mountainville the prevailing conditions were the same. Wm. Belt showed decided lack of foliage, and Gibson still more. Both under favorable condition of soil and cultivation.

Cherries, both sour and sweet, are going to be a light crop in this section. They may run from one-third to possibly one-half crop. They, however, show marked evidence of rot, and some indication of immature ripening, and the final result is likely to be rather under than over the above estimates. Pears as a whole are going to be light here, possibly one-third crop. On Mr. Shaw's grounds, however, I saw some young Kieffers which bear a nice crop, and some trees of Seckel were as well loaded as one could wish. Some Anjou trees that had been cut back severely for grafting with Bosc stock had a fine setting on the remaining wood, and will bear more fruit than trees in adjacent rows which were not so pruned. As a rule both the Bartlett and Anjou trees are lacking in foliage, and not well set with fruit, which, of course, the June drop, which is late, will reduce still more.

In peaches and Japan plums, however, the conditions are different. The promise for both these fruits is most encouraging. Trees which bore heavily last year are again loaded down with young fruit now, and this condition prevails at Mr. Dwyer's, Mr. Shaw's and at other places in this section. In Mr. Dwyer's nursery rows Burbank and Abundance are simply a sight to behold. The finest specimens of Abundance are to be seen at Mr. Shaw's place. The trees are set well apart, on rich soil well worked, and the set of fruit is not too heavy as is frequently the case. The result is healthy vigorous trees and an abundance of finely developed young fruit. Both Mr. Dwyer and Mr. Doxey, who has charge of Mr. Shaw's recent plantings, class the Abundance at the head of the plum list, and equal in quality to the strawberry. The October Purple is growing on both these grounds. Some on Mr. Dwyer's ground set in 1899 were bearing liberally. On one such young tree I counted not less than 150 plums, larger and better developed than the Burbank or Abundance nearby, though a later variety. These were on peach stock. The trees on plum stock were smaller, bore only a few plums and those of a small size, but strange to say on Mr. Shaw's grounds this condition was reversed. Those on peach stock winterkilled, trees were small and bore little or no fruit, while the trees on peach stock were larger and more promising in every way. The Wickson does not here compare favorably with the above varieties. The size and shape of tree are not so good, and the foliage is sparse. Mr. Shaw has quite a large planting of young Windsor cherries, but the cherry crop with him is light also.

The crop of peaches on both old and young trees is big. Mr. Shaw's trees bore heavily last year. They are heavily set again now. Some of his older trees, while heavily set with young fruit, show a lack of foliage, probably due partly to the cold wet weather, and partly to the heavy cropping of last year. In his new planting his Elbertas show a denser foliage and a good set of fruit. Currants at Mr. Dwyer's place threaten to come in with the strawberries. Fay is heavily loaded again this year, as it was last. At Mr. Shaw's the old currants were hardly up to the average as a whole. Some bushes are good, but they do not run universally so. The crop was a fair average one, however, on his later plantings. The apple crop is not a big one throughout this section. Mr. Dwyer's crop is good, big in fact, but he is not a large grower. Mr. Shaw is. He had a good crop last year, and will have a good many apples this year, but his trees do not all promise well. While individual trees show a heavy setting many others are light or lacking in fruit entirely, and in foliage as well. Eugene Bartow, near Mountainville, has a large planting of young Kieffer pears. They are looking most thrifty. They are young for fruiting, but there will be fruit later. J. W. Spencer's orchards look thrifty and his home grounds are inviting. Mrs. E. T. Tenney's peaches bear a promise of large crop, in keeping with general conditions of the crop through this section. I will tell about conditions farther up the river next week. J. J. D.

The Chicken Crop.

A GOOD AVERAGE.—From the reports I have had I think the average hatches have been better than usual, and the chicks are doing better than the average season, and much better than one would believe from the very wet weather we have had. There certainly seem to be plenty of chicks in this section and fine healthy ones. I have already marketed this season's hatch of chicks that weighed seven pounds to the pair, and they sold for almost $1 each. They were sold about the middle of May. D. A. MOUNT.
New Jersey.

POOR LUCK.—Most people hereabouts report poor success in hatching and raising chicks this year. A neighbor set two Cyphers incubators holding 220 eggs each, from which he hatched only 80 chicks, all of which died. He is a man of considerable experience, and cannot account for his failure. I believe his later hatches have been better, but are below the average. Our experience has been quite satisfactory and we have no complaint to make. We have a 320-egg Pineland machine, which has hatched three times this season, and which I set for the fourth time to-day. Our chicks have been strong and we have succeeded in raising almost all of them. We have hatched about 60 per cent of the eggs put into the machines. This is not as well as many do, but is not by any means a total failure. We have an indoor sectional brooder and three small outdoor brooders. We like the indoor brooder when the chicks are small as we are able to regulate temperature more evenly. After chicks are three weeks old we shift to outdoor brooders, where they do very well. R. W. R.
Mill Brook, Conn.

HENS DO WELL.—After using the incubator and brooder for five or six years, I came to the conclusion, as I wanted only about 200 chicks a year to keep up my supply of layers, that I could do it better with hens, so now the hens do all the hatching and brooding in the brooder house till the snow is off the ground, and then in some small yards, 4x12 feet, with 18-inch boards and four feet wire netting, I have a small box in one end with a sash of glass over the front for the chicks to get under in case of rain. As far as I can hear the hatchings of chicks have not been above the average around this section. I have set 31 hens this year, and I have now 250 chicks besides those that have died (about 15). This is the best I have ever done, although the weather has been very bad this Spring; 12 inches of rain in April and May. I never had chicks grow as they have this year; two that were hatched February 28, when about 13 weeks old, weighed, Light Brahma cockerel, 4 5-16 pounds, Brahma and P. Rock cockerel, 4 2-16 pounds. The first feed of the chicks was fine cracked corn and whole wheat. In three days I commenced to give beef scraps; cracked corn and scraps are kept before them all the time; the supply is renewed twice a day. Sometimes at noon the smaller ones get sour milk cheese. At night when their crops are full, ready for bed, I give them boiled potatoes which they think is a kind of pie or pudding. So far I am shaking hands with myself over the results this Spring. V. E. HASERICK.
New Hampshire.

Baby's Future.

The fond mother dreams great dreams of baby's future as she holds the sleeping little one in her arms. But the dreams will never come true unless she has given him a strong body and a healthy mind. Children die in hosts, or live to struggle through life feeble of body and dull of mind because the mother was unfit physically and mentally for motherhood. Women who use Dr. Pierce's Favorite Prescription endow their children with strong bodies and bright minds. It is every mother's duty to give her child the advantages of a healthy body and mind. A weak or sickly woman cannot do this. "Favorite Prescription" makes weak women strong and sick women well.

Mrs. Orrin Stiles, of Downing, Dunn Co., Wis., writes: "I have been intending to write to you ever since my baby was born in regard to what your 'Favorite Prescription' has done for me. I cannot praise it enough, for I have not been as well for five years as I now am. In July last I had a baby boy, weight 11 pounds, and I was only sick a short time, and since I got up have not had one sick day. I have not had any womb trouble since I got up. I was not only surprised myself but all of my friends here are surprised to see me so well."

FEEDING CALVES.

There has been a good deal written on the subject of calf feeding, and it is well, for who knows all there is to know about the subject? Nearly every farmer has his own method, which he follows with some degree of success. As conditions are seldom, if ever, identical there is probably no one method the best, but each has its place. I have had considerable experience in feeding calves during the past few years, raising from 20 to 40 each year, but not always with the best of success. Scours has been the worst enemy to guard against. The best way to cure calf scours is not to have it. This disease can in nine times out of 10 be traced to overfeeding. It must be remembered that a young calf is a very greedy animal. His stomach and digestive organs cannot stand overworking, which is caused when he is fed only twice per day, and about all he cares for. This year I am feeding somewhat different from the usual way, and more carefully, as I consider my calves extra good ones. The result has been so satisfactory that I decided to write of my method of feeding and care for the benefit of my fellow farmers.

The calf is taken from the dam when about one day old and placed in a light, warm, dry place, where he is left to himself for about 12 hours, when he is fed two quarts of milk warm from the cow. The milk is placed in a clean pail. Don't use a sour one, as it will give the calf a bad impression the first thing. Back the calf into a corner of the pen. It is usually best to get astride his back, as he can then be held in place better than when the feeder is at one side. Take the pail of milk in one hand, dip the other in the milk and place to his nose, when he will usually begin to suck. If he doesn't place the fingers gently in his mouth. There are very few calves that will not then suck almost at once. Then draw the hand downward until the milk is reached. He will usually follow down the first time, and seldom fails to after two or three trials. As soon as he gets a good taste of the milk there is no trouble save to get his head into the pail the same way whenever he lets go the fingers. Don't try to force the animal. It is seldom successful. When the calf takes his milk in this way without very much fussing, and knows how to put his head down, which is usually about the third or fourth feed, gradually work the fingers from his mouth and leave him to drink. It is, however, sometimes better not to let him have the fingers at all the third or fourth feed, but keep the pail of milk in front of him, when, after a little fussing, he goes at it and drinks. The young animal's education is then well under way, and he soon eats readily.

For two or three weeks I feed two quarts of whole milk direct from the cow night and morning. Noontimes I feed from one to two quarts of skim-milk warmed to about the same temperature, if possible. Milk that is partly cooled may be used, but must be fed in much smaller quantities than when warmed. At the age of two or three weeks they will eat some good hay, which should be fed in such quantities as will be eaten up clean. It is well to feed just after feeding milk, as it will prevent sucking where two or more have but one pen. The whole milk may now be gradually replaced with sweet skim-milk. It takes one or two weeks to make the change. Then begin to increase the feed. Here is where care and watchfulness count. As soon as there is any indication of scours decrease the feed for a day or two, and then don't increase again until you are sure the calf's capacity to take more warrants it. By following the above method of feeding my calves are in good order, not fat, and are growing nicely. When feeding myself I often increase the feed before the calf is as old as stated above, but extreme watchfulness is necessary. By keeping a careful eye on them one can feed just about all they will stand right along. It is, however, much better to underfeed than to overfeed. This is especially true during the first three months, which is the critical part of the animal's life.

Colebrook, N. H. B. A. C.

SOME CHICKEN NOTES.

Losing Little Chicks.—I have noticed in the late numbers of The R. N.-Y. that some of its readers have been losing chicks raised in brooders. I know how that goes, for more than once out of 200 chicks I have not been able to raise more than three or four. I used to blame the feed, but I am sure now that the principal cause was not keeping the chickens warm and dry. This Spring I have had splendid luck, both in hatching out and raising between 400 and 500. I have not lost more than 10 or 12; some of them the cat killed and two were killed accidentally. The first feed we give to our chicks is pinhead oatmeal, and infertile eggs chopped up fine, shells and all. They also get what I call Dutch cheese once a day mixed up with meal; once a week a feed of lean meat chopped fine. I do not let them out of the brooder house until they are 10 days or two weeks old; after that time they can run out whenever they want to and get no further care, only to see they have plenty to eat and a warm place to run into when they get cold. I am the only one in this neighborhood who uses an incubator and brooders. I find on inquiry from several who raise quite a few chickens in this vicinity that they all report good success, both in the way the eggs hatched out and also in raising the chickens.

A Hen Account.—We keep about 125 hens. They run at large part of the time but in Summer are kept in the yards, one of which is in grass. The feed is principally wheat and buckwheat with feed of oats and corn occasionally. In the morning they get a mash composed of bran, meal, ground oats and middlings, mixed with milk. I have milk before them all the time. I do not feed any meat or bone, but they have crushed shells before them always. We do not keep any males as we buy all our eggs for hatching. We send the eggs to Buffalo once a week. They are stamped and put in pasteboard boxes, one dozen in a box; then the boxes are sealed up and we guarantee every egg with our stamp on it. We have been selling to one man now for 10 years, and in that time we have not had a single complaint about our eggs not being good. Our hens are a mixed lot, but most of them are White Leghorns. We received last year from February, 1900, to March, 1901, $348 for eggs and chickens sold during that time. This does not include eggs that we sold at home or chickens that were sold to Italians. Our expenses during the same time were $197.16. This includes amount we paid for eggs for hatching, oil for running incubator and two brooders, egg boxes and labels for same. This is not so good as some of your readers tell about, but as our other work is not neglected in any way caring for the hens, we are satisfied with the result. We have beside a big lot of manure to the good. J. B.

Erie Co., N. Y.

The Best Breed of Poultry.

Farmers are after the money there is in the poultry business; therefore they want a money-making breed. They want a fowl that will lay a goodly number of eggs and yet give them a fair profit when marketed. The market demands, first of all, a yellow skin and legs; second, a medium size; third, no black pin feathers, and last, no feathered legs. Next comes the question: "What breed is there that meets these demands? Is it the Brahma? Hardly. Those feathered legs, and its slow growth, disqualify it. Is it the Langshan? No; the blue skin stands in the way. The Leghorn? It might be if it were not for its small size. Could it be the Cochin? That breed has yellow legs and skin, but its feathered legs disqualify it. Is it the Wyandotte or Plymouth Rock? It certainly is; that is, one of each variety, namely, the White. In either the White Wyandotte or the White Plymouth Rock we have yellow legs and skin, plump medium size, no feathered legs, or black pin feathers. Then, as they meet the demands of the market, and lay 200 eggs in the year, of course they are the money-making breeds; in other words, the best breeds for the farmer. Each breed lays well and reaches the highest price in the market. They do not take so long to mature as the heavier breeds, and are a better table fowl than those of a lighter weight. The breed that cannot meet both demands is surely not the fowl for the farmer. These two breeds roll the dollars in, in two ways, while the others but one. The farmer may now choose for himself. E. L. K.

North Cohocton, N. Y.

Varieties of Ducks.—Our correspondent F. E. W. made some statements regarding Pekin ducks which were questioned by R. D. B., on page 335. This writer claimed superiority for the Indian Runners. The matter was referred to A. J. Hallock, of Long Island, a high authority, who writes: "As far as my experience goes your statements in regard to the Pekins are correct. Indian Runners will not thrive in confinement. When a Runner weighs two pounds, a Pekin the same age will weigh four. I have never compared the Pekins with the other varieties mentioned. This has been a very hard season on poultry on account of so much rain and cloudy cold days. I have hatched 24,000 Pekins and lost but five per cent; this does not look as if Pekins were not hardy."

Ice House Notes.—Failing to procure easily all the sawdust that I needed, I got a load of shingle-mill sawdust mixed with shavings from the edger. The ice kept so much better than usual that the next year I used more than half of the finer sawdust with most pleasing results. The cement cow stable floor and manure pit are fine—very fine. Next comes the cellar and a walk to the road which, thanks to Mr. Barney, I can do with my man all right. E. D. R.

FARM AND DAIRY NOTES.

CARE OF MILK.—In 25 years' experience I have not seen milk in such fine condition for the month of May. Natural conditions have been perfect, cool weather with pure air, made so by the frequent showers. We shall without doubt have unfavorable weather during the scason. We must have cleanliness in the dairy. The trouble has been to make people understand what grade of cleanliness they must observe. It is a weakness of human nature to observe those who are not doing as well as we are, and pat ourselves upon the back, thus obtaining a clear conscience. I find myself doing this same thing time and again, and it takes a good deal of will power to reverse the lever and look at the fellow who is doing better, and find out how he does it. There is no contention over clean cans, strainers and pails. There are, however, two points debatable, one straining milk, and the other aeration. I have repeatedly stated in institutes that straining milk is a fraud, and usually bringing out subsequent crlticism, but following the statement with the question: "If a cow puts her foot in the pail, how much could be strained out except the leg?" Listeners were willing to give the idea a moment's thought.

I would much prefer to receive coarse dirt, and that is all a cotton strainer takes out, than to have milk pass through any kind of strainer not absolutely germ proof. The question of aeration has not been discussed by our dairy experts, only from the affirmative. I do not wish to be considered heterodox. I have been one of the strongest advocates of aeration, and honestly so, becausc I had seen good results from it. It is my judgmcnt now that the good effect is due rathcr to the cooling effect of the air than to any effect by coming in contact with the air. If milk has taken on odors from weeds or silage, which are to a certain extent volatile, aeration will matcrially aid in producing a cleaner-flavored product, provided the exposurc took place in an atmosphere not impregnated with germ life. The great danger attendant upon aeration comes from the fact that the work is usually done near the stable or milking barn. I am speaking of the factory patron, from actual count among a large number of farmers, noting the location of the milk cans when milking. Less than 50 per cent had a suitable place to aerate. This will be read by some of our patrons, and, no doubt, they will say at once: "Why have you so strenuously advocated the purchase of aerators?" No, I do not say stop aeration. Our patrons who use the combined aerators and coolers, like the Champion, as a rule deliver the best milk. But the point I wish to make clear is this. The good effect of aeration is more largely due to the cooling which takes place, either by coming in contact with a cool surface or in dropping through the air, which is usually much cooler than the milk, and not due alone to air contact. In my judgment there is only one safe way to care for milk at the farm home when delivered once a day to the creamery or cheese factory, and that is to set the milk cans in cold water, frequently stirring for the first half hour. Ice is the only agent which we can safely employ in checking germ growth. It is practically impossible to keep germs out of milk, but at a 50-degree temperature they develop so slowly that manufacture or consumption takes place before loss.

MILKING TUBES.—I think I have learned one cause of so much trouble following the use of milking tubes. It has been our experience often that more harm was done by increased inflammation than value by using the tube. I have heard farmers in institute meetings give substantially the same testimony. We formerly used no special care of the tube after use; that is, it was not sterilized before using. What better medium for conveying germs into the teat and udder? A coating of milk would adhere to the tube inside and out, just enough to grow these little plants in countless numbers. The tube would be put into a pocket or covered with a rag or hung up by a string, any way but the right way. Of late I have sterilized the tube just before using and the results have been more satisfactory. Of course there is danger under the most favorable conditions, and I would not advise their use if possible to avoid it. But sometimes it is necessary. We have just had two cases, one cow lacerated the end of the teat, and another cow with contagious garget.

GARGET REMEDY.—Dr. Smead gave us a remedy for this trouble that is a fairly good one, made of one part carbolic acid and one part glycerine; one part of this mixture to seven parts raw linseed oil, used on the end and in the passage. Contagious garget is the germ growth on the end of the teat, which finds its way up the passage until all chance for getting the milk is gone. I have used a tube on this teat, dipped each time in the abovc preparation before use, and the teat is improving. It was so far gone that hand pressure failed to start a drop.

FEEDING SILAGE.—We are fecding one dairy silage, and shall continue for two weeks. The cows have abundance of grass, yet they eat the silage as eagerly as in midwinter, but it's as fine as silk; nearly odorless, bright, clean as the day it went in. It was cut fine and well packed. Don't be afraid of cutting fine and distributing ears, stalks and leaves evenly all over the surface, anu then tread every portion alike. Don't tread the sides and let the rcst of it go without. Don't go to extremes any way in anything.

THE WET WEATHER.—Rain, rain, rain everywhere. One can find satisfaction usually in every condition if he has only improved every opportunity in the past. The past dry seasons offered a splendid chance for ditching and draining out the low marshy lands that are too wet in a wet year, and in a dry time the plant food seems quite indigestible. As I write, the clover stands large enough to cut a good swath on land formerly watcr soaked. I have found a saving in energy and expense when work was done at a time natural agencies were helpful. Although rain has been so abundant that soils are sticky and difficult to work, yet it is a much more favorable time to kill weeds, Quack grass and every manner of foul stuff than during severely dry periods. Every seed and root is determined to grow, and frequent working puts an end to their days. While our work has been delayed we have made the best of it and put large fields in the finest condition. H. E. COOK.

BRIEF DAIRY NOTES.

MILKERS AND MILKING.—Our cxperience with milkers and milking doesn't coincide with H. E. Cook, on page 383. We want and like the men who can milk cows the quickest and cleanest. We don't mean men who go at a cow "hammer and tongs," but attend strictly to business, milk fast and gently. Our experience is based upon close observation, backed up by study of daily records kept for several years on from 40 to 60 cows. The slower men almost invariably drop on the record, and are quite as apt to be the ones who are afraid of the nervous cows, and when milking keep the cow stepping and switching her tail. Fast milkers get more milk, are apt to milk more cleanly and we have never seen as the effect of their work "bunches in teats, garget, swelled udder," etc. Milking is one of the vital points in dairying and does not receive the attention it should. We believe one of the great reasons so many fail in dalryIng carried on with other lines of farming is that milkIng can be done at any time, and by anybody. This morning at 4 o'clock, tomorrow at 7, and "any old time" at night. Regularity and the cow at ease will pay.

SPRAYING COWS.—We have tried five of the commercial fly killers, and have not been perfectly satisfied. When applied just before milking most of them are good for that one milking; some may have a salutary effect on the next one, but you can count only on one milking, and it's quite a task and somewhat cxpensive, in the busy season of labor, and also of material to spray 50 or 60 cows twice a day. They are all vile smelling compounds, and ought to be used at least a half hour before milking, and this isn't always possible when the cows are in pasture. We have never observed any ill-effect upon the milk because of the odor connected with them, but have been careful to use them as long before milking as possible, and to keep the milk cans outside of the stable. As our barn has many windows the odor soon disappears. During the latter part of last season my brother was spraying the henhouse with water-gas tar, which we buy at $1 per barrel, and as there was some left in the sprayer it was tried on some of the cows. It drove the flies away, and kept them away two to three days. Since that timc we have used the tar. It seems to have no ill-effect upon the hair or skin, and keeps off the flies twice or three times as long as the fly killers, and costs less than two cents a gallon. Of course it smells bad, but not much if any worse than the commercial preparations. We have used the cheap tin sprayers for such work, but they are hard on the arms, too much friction, and we plan this season to use one of the better makes of the compressed-air sprayers.

TARRING CORN.—We have noticed the directions for spreading tar on corn. Our way is simple, and the corn never clogs or fills up holes in the planter. We use just enough tar, so that by vigorous stirring a minute or two the corn is all black, then spread in the sun a few minutes, pouring the corn on a sack. We mix a half-bushel at a time. The tar dries quickly, and the corn can be handled without blacking the fingers or use of plaster, etc. Don't leave in hot sun too long, as tar absorbs heat very fast, and will burn one's hands if spotted with tar. It might injure the corn.

Connecticut. H. G. M.

EGG-HATCHING RECORD.—On April 27 I set a 120-egg Cyphers incubator and five hens on S. C. White Leghorn eggs from pens of from 15 to 18 females to one male. Promptly on the twenty-first day there were hatched 118 chicks from incubator, and 10, 12, 13, 13 and 15 respectively from the five hens; the first one broke three eggs. There were only five infertile eggs out of the 192 set. Can anyone beat that record? MRS. A. J. A.

Hazardville, Conn.

FERTILIZER FOR RABBITS.—I notice an inquiry from a person in Pennsylvania asking for a wash to prevent rabbits peeling young apple trees. I will give you one that I have tried on apples, pears, peaches, etc., and it worked all right. Mix fresh cow droppings with enough water to make a thick wash; get a brush or a rag on the end of a stick and proceed to wash the trees up as far as needed and the rabbits will pass by on the other side. Put the wash on on a dry day, so that it will dry up quickly. If there is much rain one or more applications may be necessary. I only used one, put on in the Fall.

Bellaire, O. P. A. W.

Shoo-Fly THE ANIMALS' FRIEND

Kills every fly it strikes. Keeps off the rest. Harmless to man or beast.

This cow was a terror to milk prior to using ½ cents worth **Shoo-Fly**. Had it been used earlier she would not have lost milk and flesh to the amount of $14. The other cow was protected early and continued to give 18 qts. daily through **fly time.**

Thousands have duplicated 10 gallons seven consecutive years. If your dealer does not keep it, send us $1.00 for latest improved double tube sprayer and enough **Shoo-Fly** to protect 100 cows, or send 25c for liquid. Cash returned if cows are not protected.

SHOO-FLY MFG. CO., 1005 Fairmount Ave., Phila. Pa.

Dead Flies! Dead Lice!! EUREKA FLY KILLER

does the work on stock and poultry. We warrant it. Best agr'l authorities in U. S. endorse it. Can you ask more? Rapid seller. Big profit. Sure success. 1,000 live agents wanted. Write for prices, Exc territory given. **The J. H. Ames Co., Bowdoinham, Me.**

LIGHTNING CHURN DASHER

1st. You can churn in half the time.
2d. You can save three-fourths the labor

Why? Because the handle is in two parts—the upper part, where you take hold of it, revolves around an iron bolt. The dasher is so constructed that it revolves swiftly, both passing downward and upward, thereby increasing the momentum at least 50 per cent. Delivered free on receipt of 35c. THEO. J. ELY MFG. CO., Girard, Pa., U. S. A.

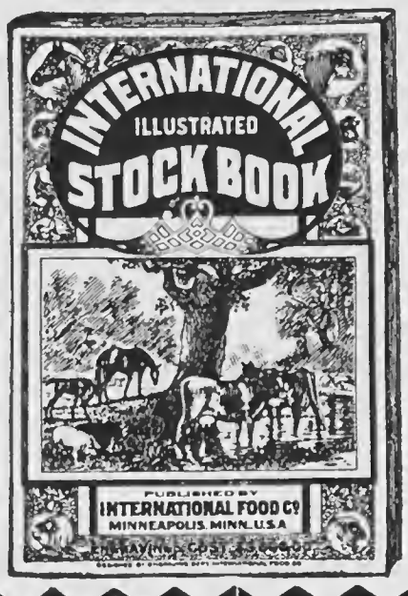
A $3000 STOCK BOOK FREE



We Will Mail You a Copy Free, ☞Postage Prepaid, If You Answer 3 Questions: **1st.**—Did you ever use **"International Stock Food"** for Horses, Cattle, Sheep, Hogs, Colts, Calves, Lambs or Pigs? **2d.**—How many head do you own? **3d.**—Name this paper.

THIS BOOK CONTAINS 183 FINE, LARGE, COLORED ENGRAVINGS OF HORSES, CATTLE, SHEEP, HOGS, POULTRY, ETC.

DESCRIPTION: THE ENGRAVINGS COST US OVER $3000 and were made by our own artists. The book is 9½x6½ ins. and the cover is a beautiful live stock picture printed in 6 brilliant colors. In **Horse Department** are fine engravings of Imported Messenger, Mambrino, Abdallah, Rysdyks' Hambletonian, Nutwood, 2:18¾; Robert J., 2:01½; Directum, 2:05¼; Nancy Hanks, 2:04; Star Pointer, 1:59¼; Johnson, 2:06¼; George Wilkes, 2:22; Aliex, 2:03¾, and many others. It contains 20 large engravings of draft and coach breeds. In **Cattle Department** are large engravings of the leading prize winners, of the different breeds, at the Trans-Mississippi Exposition. Also the **Largest Cow in the world,** weighing 2970 lbs. and 6 feet tall. In **Hog Department** are engravings of the different breeds and the latest scientific facts in regard to Hog Cholera. Also the **Largest Hog in the world,** weighing 1621 lbs. In **Sheep Department** are extra good engravings of the prize winners, of the different breeds, at Trans-Mississippi Exposition. In **Poultry Department** are engravings of the different breeds. **Your special attention** is called to the fact that the book also gives a description and history of the different breeds of Horses, Cattle, Sheep, Hogs and Poultry. The **Veterinary Department** is very practical and contains extra fine veterinary illustrations. It gives the different diseases for Horses, Cattle, Sheep, Hogs and Poultry, and tells what to do for each. The **Veterinary Department** will be a great addition to your live stock library and **will save you hundreds of dollars. You cannot buy a book for $10** that will give you as much practical information and as many fine colored engravings of noted animals.

We Will Give You $14.00 Worth of "International Stock Food" If Book Is Not As Stated.

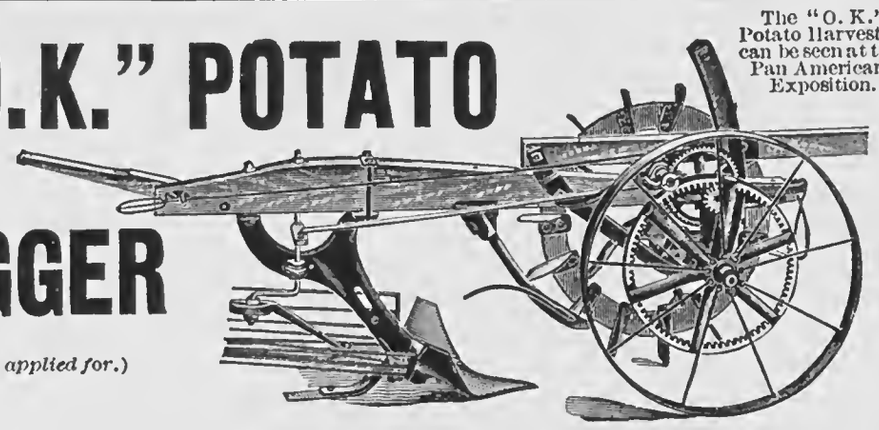
"International Stock Food" is endorsed by over 100 leading "Farm Papers" and is used and endorsed by over 500,000 stockmen and farmers, and is sold on a "spot cash guarantee" by over 20,000 dealers. ☞**Your money will always be refunded if it ever fails to make you extra profit in growing, fattening, milking, or in keeping your stock healthy.**☜ Established 12 years and has the largest sale. Included in the United States Government exhibit at Paris and won the highest award and medal at that Exposition, 1900. ☞**The editor of this paper will tell you that "International Stock Book" is one of the best illustrated books ever published.** Most of the illustrations are of noted animals.

Largest Stock Food Factory in the World. Capital Paid in $300,000.00.

Answer the 3 Questions and write for this Book to **INTERNATIONAL FOOD CO.** MINNEAPOLIS, MINN., U. S. A.

"O.K." POTATO DIGGER

The "O. K." Potato Harvester can be seen at the Pan American Exposition.



(Patent applied for.)

Sent on trial. Test it in your own field. If it does the work, pay for it. If it fails, reject it.

We want a good, live, hustling man in each township in potato section to take orders. One who has a good team and can and will spend time enough between now and digging time to call on every farmer in the township who grows five acres or more. **We Pay Liberal Cash Commission.**

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2683. NEW YORK, JUNE 29, 1901. $1 PER YEAR

ALFALFA AS A GRAIN FEED.

HOW IT COMPARES WITH BRAN.

Flint Corn Planted Late.

LATE CORN.—The picture shown at Fig. 188 is taken from the last report of the New Jersey Experiment Station. It shows a crop of Thoroughbred flint corn grown as a late crop to provide green food or silage. This corn was planted on July 10 after a crop of oats and peas had been harvested. The oats and peas were seeded April 3, and cut early in July. The ground was then plowed and planted to corn, which made the growth indicated in the picture, and was cut from September 22 to 30. Crimson clover was sown in this corn, making a good growth, so that three crops were really produced. We refer to this in order to show how late-planted corn frequently makes a rapid growth during the latter part of Summer, and will produce a large amount of forage. We have planted this variety of corn as late as July 15 and had it mature grain. This year, when the season is unusually late, we shall continue to plant up to July 1 for the regular crop. We frequently hear of northern farmers who plant corn quite late on the hill tops and rarely fail to secure a full crop for the silo. This year, when many farmers are sadly discouraged at the outlook, we would advise planting corn late. The flint varieties will be most likely to mature grain, but even if they do not there will be a heavy yield of fodder suitable either for silage or for dry feeding.

WHITE FLINT CORN, CUT SEPTEMBER 22—AFTER OATS AND PEAS. FIG. 188.

ALFALFA VS. BRAN. — Two weeks ago we gave the figures prepared by Prof. Voorhees to show how much protein may be produced by an acre in Alfalfa. It will require seven tons of wheat bran or 10 tons of oats to equal the value of one year's output of such a "protein factory." But is not that only one side of the matter? Sawdust contains a certain amount of protein, yet it will not take the place of wheat bran or oats in a ration for cow or horse. To what extent is the Alfalfa hay equal to grain? That is the question farmers want answered—not so much by the chemist as by the cow. In order to answer this Prof. Voorhees took four cows averaging about 1,000 pounds live weight. Two different rations were made up as follows: Ration 1.—35 pounds silage, 11 pounds Alfalfa hay, six pounds mixed hay, two pounds cotton-seed meal. Ration 2.—35 pounds silage, six pounds mixed hay, four pounds wheat bran, four pounds dried brewers' grains, two pounds cotton-seed meal. The first ration cost 12.08 cents and the grain ration 15.38 cents. As will be seen the total protein was about the same in each—the 11 pounds Alfalfa hay giving 1.46 pound, about the same as that in the eight pounds of wheat bran and dried brewers' grains. Two cows were fed on the Alfalfa ration for 15 days while the others were being fed on the grain. Then they were reversed—that is, the two fed on grain were put on the Alfalfa. This was kept up for 60 days and the milk from the cows was accurately weighed and tested. The results show that during the whole period of 60 days the cows fed on bran and grains produced only 113 pounds more milk than those fed on Alfalfa hay. The milk produced from Alfalfa cost 58 cents per 100 pounds, while the cost of a pound of butter was 12 cents. With the grain ration the cost of 100 pounds of milk was 70.7 cents and of a pound of butter 14.3 cents. From these practical results Prof. Voorhees concludes that when wheat bran and dried brewers' grains can be bought for $17 per ton, Alfalfa hay is worth $11.16 for actual feeding. If the Alfalfa hay were ground up as fine as ordinary bran we believe it would be worth practically as much for feeding purposes as the bran. Yet why should the Alfalfa be ground up? The cattle are fully competent to do this grinding.

SILAGE AND ALFALFA.—In connection with this Alfalfa hay feeding I asked Prof. Lane why a ration composed of silage and Alfalfa, without grain, could not be fed. He said: "I see no objection to it, provided too much of the hay is not fed at one time, in which case there would be a possible danger of bloating. The following quantities of these two foods make a fairly well balanced ration: 35 pounds of corn silage and 18 pounds of Alfalfa hay. In feeding such a ration, I would divide the silage equally between the morning and evening feeds, and feed five pounds of hay morning and night, and eight pounds in the middle of the day. We expect to conduct more experiments along this line next Winter."

"What about feeding Alfalfa hay alone?"

"While we have never fed such a ration, it is my opinion that it would not prove satisfactory. In the first place, it is not a balanced ration, the nutritive ratio being 1:38. In the second place, I do not believe that such a ration fed continuously would be as healthful as one containing a larger proportion of carbohydrates. In the third place, it is my opinion that it would be more profitable to feed silage, roots or other foods of this character in connection with it, provided they were cheaper than the hay, which is usually the case in the East."

"We have heard that this is done in the West."

"In regard to Alfalfa hay in Colorado, this fact should be taken into consideration, that Alfalfa hay as it is usually fed in the West is an entirely different article from that represented by the sample we have shown you here. Those who have seen it handled in the Western States report that it is allowed to come nearly to maturity before cutting, hence a large proportion of the leaves is lost. When this is the case, one can readily see that a ration made up of Alfalfa hay of this quality might be a safe food, a healthy food and possibly approach a balanced ration. So you see the question hinges largely upon the quality and cheapness of the hay in considering its value as a ration. In some localities in the West, I have no doubt it is their cheapest food."

"How do you handle the hay?"

"Our method was as follows: As soon as the dew was off in the morning, the Alfalfa was cut, and allowed to remain in the swath until the middle of the afternoon, when it was thoroughly wilted. It was then raked and piled in small cocks of medium size, care being taken to build them with as little slope as possible on the sides to secure a uniform cure. After two days, it was found to be thoroughly cured, and was hauled to the barn, without any further handling, except that the cocks were turned bottom side up for an hour before hauling. Hay of good quality was secured which is in excellent condition after storing. There was practically no loss of leaves from this method of curing. Cattle prefer it to Timothy, Red-top, or oat and pea hay. The yield per acre from the one cutting was 2.21 tons."

Farmers and others are beginning to realize the great possibilities of Alfalfa. There will be thousands of acres started during the next year. Some will sow the seed on ground not well adapted or well prepared, and of course will be disappointed. Others will sow it with no fair idea of what is to be done with the crop. We know of one man who has seeded several acres of orchard with oats and Alfalfa. Under all ordinary circumstances this crop should never go in an orchard. The man we speak of keeps but little stock, and has no clear idea as to what he will do with the crop. He has simply heard the great stories that are told about it. It is not likely that Alfalfa hay will sell readily at first sight in spite of its great value. The point of all this is that Alfalfa is a special crop of great promise. It is not a good crop to sell or to use as green manure, but where one has a fair outfit of stock and a field so situated that it can go into permanent meadow it will surely pay to experiment with Alfalfa.

H. W. C.

CHEMICALS, CLOVER, COWS AND LIME.

A PROSPEROUS NEW JERSEY FARM.

Some Methods and Results Analyzed.

AN OLD STORY.—It is 12 years since I began to study the system of farming at Cranbury, N. J., which has been called "Chemicals and Clover." Every year since then, with one exception, we have had something to say about the farm of D. C. Lewis, and this year the farm was again visited. It is interesting to watch these fields pass, year after year, through the regular rotation without any falling off in crop, but rather with an increase of yield.

The rotation and plan of this farm is a simple one, and is easily stated. This year, for example, there are 16 acres in potatoes, 16 in corn, 18 in wheat, and 34 in grass. The five fields are nearly equal in size. In the potato field one acre is given this year to oats and peas, for cow feed. Starting with corn, all the year's supply of manure is spread on a two-year-old sod and plowed under. Formerly fertilizer was also used on the corn, but since more cows have been kept this has not been necessary. Potatoes follow corn, and from 1,200 to 1,600 pounds per acre of the Mapes potato fertilizer are used. Wheat seeded to clover and Timothy follow the potatoes, the grass being cut two years, and then plowed under for corn. I have seen the farm pass through more than two full rotations, and it is safe to say that in spite of the heavy crops that have been produced and sold, it is now more productive than ever. Formerly Mr. Lewis was almost careless about the supplies of stable manure. The long stalks were nibbled by stock and thrown into the barnyard, to be trodden down by the cattle. Now these stalks are shredded—part of them being put into a silo. A successful creamery in the neighborhood has made it profitable to increase the herd of cows. These cows are well fed. All this means more and better manure, which is crowded on the sod for corn. After three years of this heavier manuring, Mr. Lewis said they begin to see the effect of it, particularly in the grain and grass. There has been no change in the heavy use of fertilizers on potatoes. Mr. Lewis is fully satisfied that this high-grade fertilizer is the best and most economical plant food for the potato crop. For reasons which I shall try to give later, he believes it would be a mistake in his system of farming to use less fertilizer.

FARM INCOME.—In order to show what this New Jersey farm, with about 80 acres under cultivation, will produce with this system, I give the receipts for the last crop year:

Milk and calves	$696.21
Pork	129.54
Wheat	282.57
Cows	251.76
Hay	831.81
Potatoes	829.54
Sundries	16.75
Total	$3,037.18

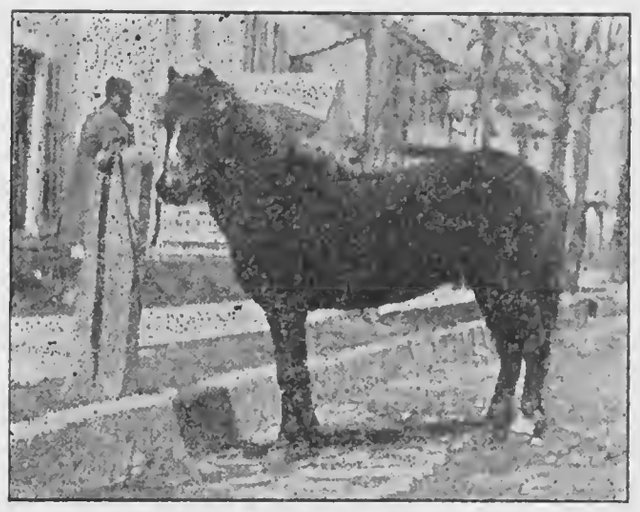
Last year was not a good season for potatoes, as the dry weather hurt the crop. Hay brought more money than usual. Strange to say, there has been less hay consumed on the farm since more cows were kept. The reason for this is the fact that the cornstalks are utilized as never before. The silo makes a place for much of the corn crop, and the dry stalks are shredded so as to provide good roughage for all stock. The result is more hay to sell, as has been the case on thousands of farms where the steel teeth of the shedder have torn the stiffness out of the stalks. It will be noticed that several cows and heifers were sold during the year. It is hard to get good farm hands—especially good milkers—that is the cry wherever we go. The chief reason for keeping the cows on this farm is to provide a market for the cornstalks, which were in former years largely wasted. Bran, linseed, cotton-seed meal and other strong feeds are bought and fed with the silage and shredded fodder, so that the money obtained for milk is largely cornstalk cash. Mr. Lewis says that his 11 head of cattle used barely a ton of hay all through the Winter. The cows are good ones, for an average of about eight of them earned the year's milk money given in table above.

CONSERVATIVE STATEMENT.—It is easy to grow enthusiastic over this system of farming. It seems so easy to follow this well-devised rotation through field after field, crowding the manure upon the corn and the fertilizer upon the potatoes, plowing about 40 per cent of the cultivated area each Spring, and following naturally with planting, cultivating, hoeing, haying, thrashing, digging, seeding and corn cutting. It sounds easy, but I want to avoid the mistake of giving the impression that any man with a 100-acre farm should sell $3,000 worth of produce, or that he is a poor farmer if he does not do so. I have no patience with reporters who attempt to draw such conclusions. Mr. Lewis has a farm that is admirably adapted to the crops he is growing. It is level, well drained and free from stones. I could not possibly duplicate Mr. Lewis's rotation or crops on my own farm, because my soil is rough and hilly and full of stones, while parts of it can never be properly drained. Some of his methods and experiences are, however, of great value to me, and I believe they will be to others. I shall try in future articles to analyze this system of farming, and see how it can be applied to general agriculture. Let it be remembered that farming in this section of New Jersey is more than a century old. These farms supplied food to Washington and his army during the Revolution, yet to-day they are producing larger crops than ever, though all the hay and wheat is sent away from them. Hay is said to be the heart of a farm, yet this farm thrives with its "heart" cut out and a fertilizer bag put in its place!

When I asked Mr. Lewis to name the most important experiment he had tried of late years, he said without hesitation: "The use of lime!" I will try to describe this next week. H. W. C.

PAN-AMERICAN EXPOSITION NOTES.

BEAUTIFUL DISPLAYS.—The Pan-American Exposition is now in full operation, and the grounds and buildings are thronged with visitors every day, who are loud in their expressions of admiration for the beauty of the buildings and the fine exhibits displayed in the various departments. Taken as a whole, this Exposition is perhaps the most beautiful of any that has ever been made, and it is certainly the most beautiful in design and execution of any on this continent, for I have seen all of the leading ones up to the present date. In size, it is not so large as the Columbian Exposition at Chicago, but the color scheme, which has been carried out in the buildings, is much more handsome, being variegated with the softest and most beautiful tints which the artist could intermingle to produce a charming whole, while the buildings at Chicago were, with one or two minor exceptions, plain white, which was quite painful to the eyes on a bright day. At night the electrical display is simply marvelous, and the like



A WELSH PONY. FIG. 189.

has never been seen, and perhaps will not be seen at any Exposition for some time to come, because of the nearness of this city to Niagara Falls, where the power is generated which lights the buildings and grounds so wonderfully. The electrician who planned the lighting of the buildings told me that as nearly as he could calculate there were 40,000 lights on the Electric Tower alone.

HOW TO GET THERE.—To those who are coming to the Exposition it is important to understand the way to enter the grounds, in order to obtain the best view, because the two principal street-car lines, and also the steam railroad, takes visitors mostly to the "back doors", so to speak, of the Exposition, instead of the "front door", or main entrance. If visitors will ask the street-car conductors to put them off at Forest Avenue, which runs east and west, instead of parallel with the main car lines, and then walk either to the Water Gate, or to Lincoln Parkway Gate, which latter is the main entrance, they will be delighted with the appearance and spaciousness of the grounds, and will have a delightful view of the buildings and esplanada as they enter through the Triumphal Causeway. The Causeway itself is a wonderful piece of art. It is composed of four great towers surmounted by gigantic horses bearing heralds. On either side of this main entrance are the principal parts of the ornamental grounds, where are to be seen fine groups of shrubbery and trees from some of the leading nurserymen. There are flower beds of beautiful design, filled with the choicest varieties known. Those who fail to make a careful examination of this part of the Exposition will make a mistake.

THE FLOWER SHOW.—In coming up the Elmwood line of the street-cars, one should get off at the Elmwood gate, if he passes Forest Avenue crossing, and not go on to the Amherst gate. This will take the visitor into one side of the flower gardens, and in front of the Horticulture Building. Such a display of Spring bulbs has never before been seen on any public grounds. The tulip beds in their season have been especially fine. One of them contained 1,200 of the best bulbs from Holland, which were of different colors and planted in ribbon style. The effect was very pleasing. Beds of Hyacinths, Crocuses and other Spring bulbs were almost equally gorgeous in their gay colors. The pansy beds are still very attractive. There is one near the Service Building that is by far the largest and most harmonious in its coloring of any that I have ever seen. It is a plain ellipse, about 40 feet in its longest diameter, and planted in bands of pure yellow, blue, white, and almost black. I doubt if such another pansy bed has ever been planted. It stands in the middle of a lawn, that is well kept, and skirted with a setting of beautiful shrubs and trees.

In the lagoons and sunken gardens are other flowers, which are beautiful beyond description. Among the exotic water lilies will be seen the gigantic Victoria regia and the Nymphæas, from South America, Australia, Japan and Africa. One of these pools is heated by steam, in order to bring the water to a suitable temperature to cause these tender plants to grow and bloom naturally.

THE FRUIT EXHIBIT is continuing to be one of the most pleasing features of the Exposition. The supply of apples in cold storage from several States is ample to keep the display of that fruit good until apples of the new crop are abundant. It is remarkable how well these cold-storage apples keep on the tables. Some of them have endured for four weeks without rotting, but, of course, most of them have to be replaced after about two weeks of exposure. The wrapping with two papers and a uniform temperature of about 35 degrees F. seems to furnish just the right conditions. New York has the largest apple display, but Illinois, Missouri and Ontario are not far behind. Oregon, Washington, Virginia, Delaware, Connecticut, Maine and Michigan also have good apple shows. The strawberries and cherries are coming in. Florida and California are getting in fresh fruits in some degree. Next week I will go more into detail.

H. E. VAN DEMAN.

GRANGE INSURANCE IN MASSACHUSETTS.

It is true that our State Grange has secured a controlling voice in the management of an old-established mutual insurance company. We have had control of the company for just three months, and during that time have written as much insurance as was written during all of last year. We have already discovered that notwithstanding the assertions of most of the mutual companies that their farm business was being done at a loss, their agents at least are very loath to allow their clients to renew with us. We do not believe that the statement so assiduously circulated that farm business is done at a loss which other lines of insurance are obliged to pay is strictly correct. And yet, paradoxical as it may seem, it is possibly commercially correct. I mean by that when a large fire occurs which wipes out millions of dollars, such as the recent Jacksonville fire and the historic Chicago and Boston fires, causing a property loss greater than would occur in all the farm fires of 100 years, the companies all go through a process of bankruptcy and pay only a fractional part of the total losses, and then start over again. If such losses are fully paid we are confident that farm risks will compare favorably with those of other lines.

But aside from this what are the facts in the case? The present rates of the Massachusetts mutual companies, after deducting the by no means certain dividend, are $4 per $1,000 per year. Compare with this the rates of the following which insure farm property exclusively: The Androscoggin of Maine, $2.10 actual average for five years, and $1.78 for another period of five years. The Sandy and Beaver Valley of Ohio $1.53 to $3.23 per year. The Patrons' Fire and Tornado Company of Kansas, $2.26 average for 10 years; the Patrons' Mutual of New Hampshire, $1.87 average for 12 years; the Jefferson County Patrons' Fire Relief Association of New York, $1.78 average for three years. Do you blame us for wanting to investigate the subject by a practical experiment? The farm property is actually in a class by itself so far as hazard is concerned, then it ought to bear its own burdens. One thing is certain; while we are demonstrating the truth or falsity of this statement our members are going to get their insurance at actual cost. We may be obliged to admit the Patrons of Husbandry in Massachusetts are less capable than their brothers in other States, but we think not.

Secretary. E. D. HOWE.

USE FOR THE PONY.—Lady Wales, the Welsh pony shown in Fig. 189, is owned by H. J. Kurtz, of Covington, O. These little horses average a trifle more than 3½ feet high, and weigh from 400 to 600 pounds. From their ancestors and rugged habits in the cold north of Europe, they have inherited strong constitutions, and can stand hardship well, though no animal shows more appreciation of kindness and good care. They are friendly in disposition, and take kindly to all sorts of fussing and petting. This makes them ideal companions for children. But they are more than pets. Some can travel as much as 10 miles an hour on the road, and are highly useful on a farm where there is considerable "running around" to do. The children can harness the pony and drive to town for a plow-point or on some other errand, thus taking the place of a man and horse. The pony will pay for his keep where there are children to handle him and some little work for him to do.

HOOSIER FARM NOTES.

A Defective Stand After Deep Planting.

CULTIVATORS.—The writer met with a surprise lately in learning that the once-popular spring-tooth cultivator for corn, either riding or walking, is clear out of date. So sweeping and sudden a change is seldom witnessed. It is claimed after 10 years of popularity that they do not plow deep enough, especially in firm soil, such as our clay upland; that in loose black land they do well. Do not think for a moment that farmers have gone back to the old deep plowing which made the Brown cultivator so popular 20 years ago. But the fact is that the spring-tooth is too radical a change. In traveling quite a good deal among farmers I am pleased to see that in their line they are quite experts. They talk intelligently about methods of cultivating and about farm tools. The cultivating plow that will live must now have four small shovels on a side and they must be set zigzag, that is, not in a stair-step row. They must be arranged so as to run shallow but do effective work when it is needed. The wooden break-pin has also gone to stay and the spring-break is the rage. Of course anyone who knows anything about modern farming understands that everybody buys riding cultivators. One often trades in an old "walker" for a song because the riders are so much better. In fact, they jokingly say that a man is a fool that walks in plowed ground all day, and ought to be kicked right good for having so little sense.

MANY PLANT TOO DEEP.—This is the most common fault noticed. Nature plants about twice the depth of the thickness of the seed. Many farmers plant three or four inches deep. The plumule depends wholly on the starch in the seed to grow to the light, after which it grows hair roots and takes up nourishment from the soil. If deep the plumule is necessarily slender and weak, and if the soil is puddled by heavy rain it will often curl up and not get out at all. If planted shallow it will grow strong and push its way out. A few days ago I was looking at a field that the farmer said he had just finished planting over, and it was June 6. The only trouble was planting too deep. That one mistake had cost him probably half the value of his crop. It was the more aggravating because it was wholly unnecessary. Often one loses from causes that he cannot control, but this was purely a blunder, and a costly one, too. As I said a few weeks ago, the roots of corn, like other grasses, come to the top and his roots were no deeper than if planted shallow. He needed a furrow.

MANY NICE CALVES.—In passing through several central counties lately I noticed from three to 10 beautiful dark red calves in most every barn lot. This is unusual, since they commonly go for veal, or are picked up by feeders. This year the veals are low in price, and the calves having been so high lately are held. Beef being lower than two years ago there is not so much demand in that way. At that time there were two men watching every calf, when a baby, to snap it up as a feeder. In fact, I knew many calves bought last year before they were born.

PLUNGERS.—It is interesting to see how many farmers dash after any new promise. All goes to hay, and tools and barns are prepared. Then a bad crop or two and the notion changes to potatoes, or to hogs and then to rye and Blue grass. But the farmers who make money vary but little and get out before the crash. They maintain their rotation and equilibrium and make a little money each year. It is costly to equip oneself for any crop and to change violently, and often is ruining. I have in mind a farmer who went around to many sales, and went in debt for stock. Here he had to bid against those who will pay enough more for stuff to equal 20 or 30 per cent because off a year without interest. When his notes came due sheep and cattle had fallen till he got nothing for feeding and little for feed. The hogs raised in price and did some good. But he actually paid $5 a head for common sheep that the owner had bought at the yards a few weeks before at $3. This is plunging, and with little judgment, too. Money is seldom made and is very often lost in that way. It is the steady, careful man, who trades judiciously and rotates crops, who makes money on a farm. In the Central West the crops are unusually good. A half acreage of wheat was sown, on account of recent losses of the crop, but it is promising. The grass is good and corn a little late, but may make a great crop. Farmers are in good spirits and farm homes were never more beautiful. E. H. COLLINS.

SEE RURALISMS, PAGE 454.

GETTING RICH IN A HURRY.

GUESSING CONTESTS.—We receive letters from people who ask about various "guessing contests" advertised in certain papers. It is hard to believe that any great number of country people really believe that they can win money in such schemes. The rogues appear to think so, however, for this is what an advertising journal says:

He knows just where to go for suckers. Whenever a new guessing contest is originated by him, the first place it is tried out is in the agricultural papers. His latest ad., *"Money—You can put dollars in your pocket,"* is an exclusive offer to farmers. This exclusiveness is because the public, in the larger cities, no longer wastes any time on guessing contests.

Town and city people may have outgrown this particular swindle, but they have done so only to run after worse ones. The plan is to print a number of letters and offer prizes in cash to those who can put them together so as to make the names of several noted cities, vessels or men. It is so easy that thousands of silly people make up the names and expect to win the "prize." In order to "enter" they must send a small amount of money as a year's subscription to a worthless paper! It is sad to think that sane people cannot see through this evident trap. It would seem as though country people above all others ought to realize that life's prizes are seldom distributed as guess-work. A farmer sees the slow, steady growth of Nature's handiwork. The evidences are all about him. It is strange that he can be driven into schemes for securing sudden wealth without work or great skill.

"GREEN GOODS."—Readers are often shocked at receiving typewritten letters marked "confidential" containing the following proposition:

Your name was sent to me by my son, who is my traveling representative. He tells me he has learned that you are a man who has got a still tongue and a reliable and trustworthy man to do business with, and I therefore take the liberty of proposing a scheme to you that 99 out of a hundred up-to-date business men would gladly grasp if they could personally examine the work, thereby convincing themselves of the absolute safety of my offer. I am an expert engraver, having for 23 years been employed in the Bureau of Engraving in Washington, D. C., and for 12 years was superintendent of one of the largest bank note companies in this country. During my leisure hours I took up as a side issue the duplication of Ones, Fives and Tens, and as they were the original denominations I had worked upon, you can believe me when I say they are perfect. I sell them at the following prices:

Four Thousand Dollars in my goods will cost you Five Hundred Dollars.

Seven Thousand in my goods will cost you Seven Hundred Dollars.

Eleven Thousand in my goods will cost you One Thousand Dollars.

Of course this rascal lies when he talks about his "son" or any personal knowledge of your affairs. The letter is a printed circular sent to addresses which these rascals obtain from newspapers or directories. They have no money to sell. The whole thing is a game of bluff. Those who are foolish enough to come here with good money are sure to run up against shrewd and desperate scoundrels. One would think that no one but a fool or a knave would try to buy these "green goods," yet it is a fact that persons who are supposed to be highly moral and respectable at home sneak to this great city after this "money"—and generally sneak home sadder and wiser men.

EVERYBODY'S GARDEN.

KOHL RABI.—This vegetable is grown by many market gardeners at a fair profit, and is desirable even in the small garden. The seed may be sown up to the middle of June, or even later, in drills, the same as turnips. They will be found a valuable acquisition to the table supply, and any surplus above home or market use may be fed to stock with good results. They are cooked the same as turnips, and considered by many superior to that vegetable, and as a drought-resister are more hardy.

CABBAGE WORMS AND LICE.—These pests cause cabbage growers no end of heartaches; but still the cabbage growing industry goes on. Fortunately there are many remedies at hand, and some of them may usually be relied upon to hold their ravages in check. For the Cabbage worm, in small areas, where the use of arsenites may be undesirable, wood ashes, air-slaked lime, tobacco dust or salt are usually effective. They should be applied in the early morning, while the plants are damp with dew. Salt used in the latter stages of growth is not only sure death to the worms, but assists very materially in developing and hardening of the heads. In the larger operations, Paris-green is freely used, and without the least danger, until the cabbage is two-thirds grown or more. One-fourth pound to 35 gallons of water is a safe proportion, and may be used as often as necessary. Green lice often become very troublesome, but are usually themselves held in check by parasitic enemies, which prey upon them. Lack of vigor in the plants is thought to be a favorable condition for their development, and in this case, thorough cultivation, with the application of some active fertilizer, as nitrate of soda, will help to overcome the difficulty. Doubtless weather conditions have most to do with their development, and cool, damp weather is thought to be most favorable for their onslaught. For this reason they should never be planted in shaded ground, but where the sunlight has as much play as possible. The remedies are pyrethrum dusted on, or sprayed on in solution in the proportion of a tablespoonful to two gallons of water. Kerosene emulsion, air-slaked lime or tobacco dust are also used; but whatever the remedy, care must be taken to get it to the undersides of the leaves, as that is where the insects work, and hence the difficulty in reaching them with any of the remedies.

CAULIFLOWER.—The general culture of the cauliflower is essentially the same as for cabbage, both requiring rich soil and constant cultivation. This late in the season it is preferable to buy the plants for setting, rather than to grow them from the seed. Blanching is done the same as endive, requiring but a few days of time. Select stock always finds a ready market, especially the late-grown, and at very satisfactory prices. With the addition of beets, carrots, beans, etc., for which there is still ample time, a very satisfactory garden may still be grown this year. J. E. MORSE.

Michigan.

BIG MELONS.—In the issue of June 15, on page 420, I saw an inquiry from T. W. F., South Bend, Neb., about raising large watermelons. He says he plants them five feet apart each way, and complains about their growing small. In southern New Jersey we always plant watermelons nine feet apart each way and thin to one plant in each hill, and we always have large melons if we plant a large-growing variety. R. M. S.

Erma, N. J.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Lime on Manure.

Reader, Lopez, Wash.—Shall I put air-slaked lime on manure in stable? If not, would it do to mix in when manure is hauled out to compost heap? I am using sawdust as absorbent, and wish to rot it before putting on land.

ANS.—We would not put lime in the manure. You will lose more than you gain by doing so. Lime, especially in the stables with the liquid manure, will set free more or less ammonia. Plaster or sulphate of lime is much better as an absorbent, though it will not rot the sawdust. If the sawdust is well soaked in the liquids and packed with the horse manure it will be fit for use in a reasonable time.

Snout Beetle on Fruit.

J. H. W., Blaine, W. Va.—I send you sample bug that I find on my young orchard. They are something new to me. They eat the young shoot where it joins the tree. I think one of these bugs would kill a young apple tree in a few days. They do not eat the leaves, only the sprout where it joins the tree. They eat on the under side through the old bark, and the shoot will wither and die. I have some trees that have not a green twig on them, all eaten off in the last week.

ANS.—The depredators are a large snout-beetle, known as the Imbricated snout-beetle, which has been found feeding on a very large number of different plants. The eggs of this insect are laid in May and June, between two leaves on various plants, one female being capable of laying over 500 eggs. The grubs hatching from these eggs have been reared on strawberry leaves. There is but one generation or brood of the insect in a year, the adults or beetles hibernating. The beetles are most injurious in May. Like its near relative, the Plum curculio, this Imbricated snout-beetle also drops to the ground when disturbed, so that the beetles could be easily jarred from the trees into curculio-catchers or sheets spread on the ground, and then destroyed. This is a practicable and effective method for J. H. W. to use in his young apple orchard.

M. V. SLINGERLAND.

Cow Peas and Timothy.

E. L. P., Hartford Co., Conn.—I have a piece of turf land which was plowed late last Fall and sown to rye. The rye does not promise to amount to anything. I wish to get the land into mowing. With this end in view, would it do to wheel-harrow it and sow cow peas and Timothy seed? If so, when should it be done, and could the cow-pea vines be left to decompose on the land without injury to the grass?

ANS.—While we have never tried it we should consider cow peas and Timothy a worse team to work together than an ox and a trotting horse. The time for sowing cow peas is not the natural time for seeding Timothy. You would not be likely to obtain a good stand of the grass. We should sow the cow peas alone, plow them under about September 1 and then prepare the land thoroughly and seed to Timothy and Red-top.

VAN DEMAN'S FRUIT NOTES.

ALL SORTS OF QUESTIONS ANSWERED.

Seedling Peach Trees; Mulching.

R. E. D., Springland, N. Y.—1. Last Fall I planted about 300 peach pits of a very superior grade. They came up to a pit, are in one single row about 20 feet long and are about six inches high. What would you advise me to do with them, as I wish to plant them when large enough? I don't wish to bud them. 2. I have trees that have been set out one and two years, pears, peaches, quinces and plums. I wish to mulch them, but people around here think that is a waste of time as the trees are in good order. Will you advise me whether it would be best to mulch them? 3. Which is the largest chicken that grows?

ANS.—1. These little seedlings seem to be properly planted in every way and in good condition for making thrifty trees for planting into orchard form next year, except that they are too close together. They should stand from six to eight inches apart in the row. My plan would be to watch for a nice time for transplanting, and carefully remove the larger part of them to other rows where they may have plenty of room to grow. Early next Spring they should be planted into the orchard. 2. Mulching trees in an orchard is all right if it is continued indefinitely. That is the way nature grows trees. But if the plan is changed from mulching to plowing and cultivating there will be trouble, for the roots will come to the surface of the soil just under the mulch and be torn badly by the tools. In case the mulching plan is followed the entire surface of the orchard should be deeply covered with straw or some other such material, and the richer it is in manurial elements the better will it be for the trees; provided it is not ordinary farm manure, which might be too rich. But the better plan in nearly all cases is to till the ground thoroughly. It is cheaper than mulching except in very stony or hilly land, and is usually much more practicable.

3. The Dark and Light Brahmas are the largest breeds of chickens.

Round-Headed Apple-Tree Borer.

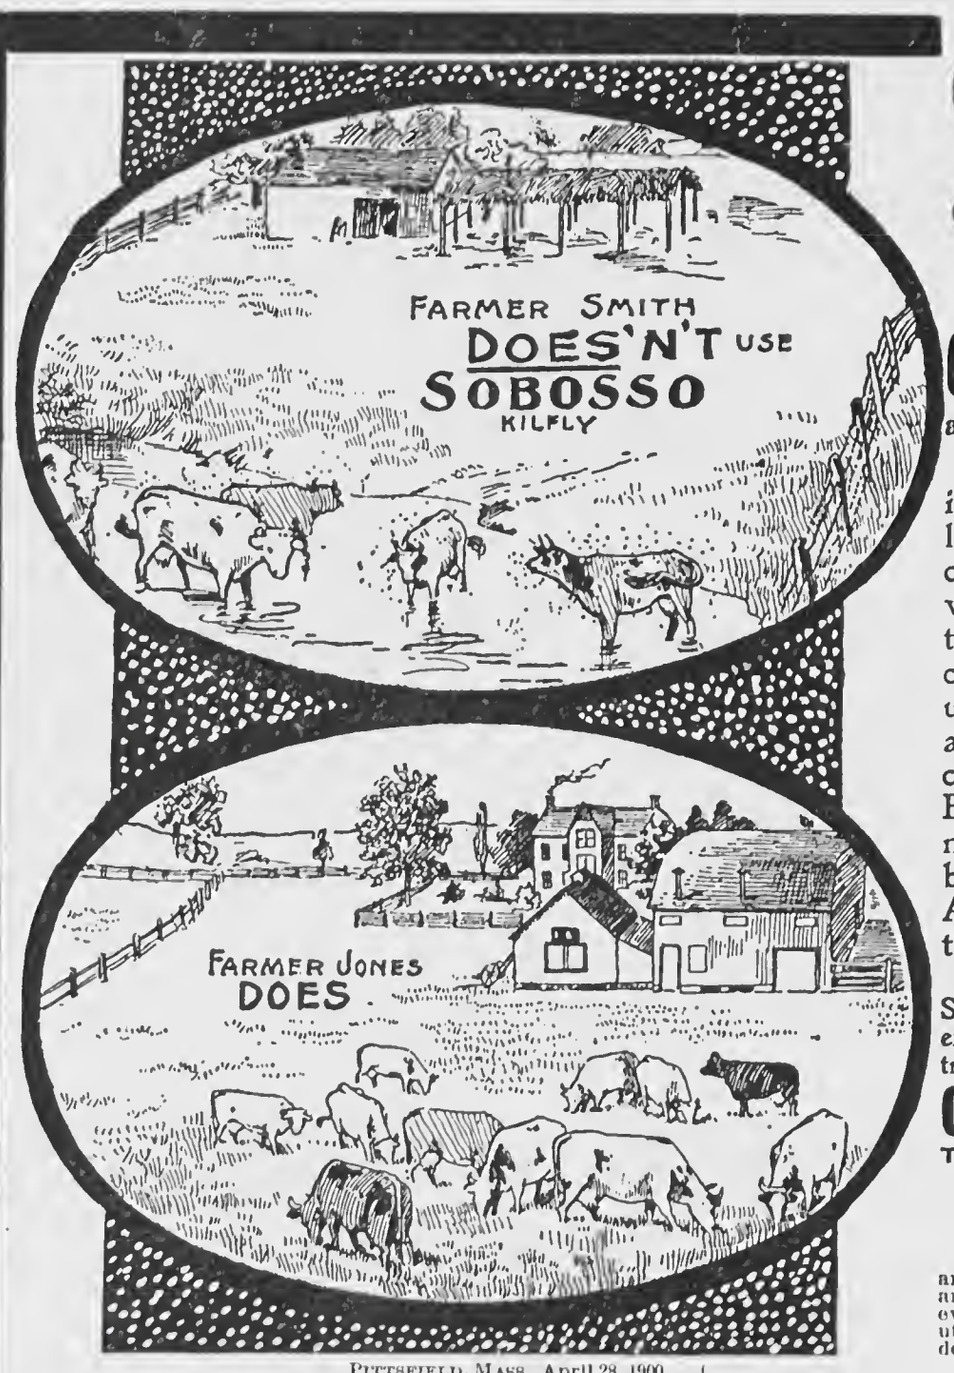
A. C. C., Millstone, Ky.—I have a young orchard which is infested by some pests I wish to get rid of. Several weeks ago I noticed that a few trees were dying, and on examination I found that they had small holes bored through the bark just above the ground. The holes are about the size of a small gimlet hole, and range down. I split one of the holes from the root and found a large striped beetle. There are fresh trees attacked every day. What is it, and what the remedy?

ANS.—The writer does not say what kind of an orchard he has, but it is probably an apple orchard, judging by the description of the insect and its work. It is almost certainly the Round-headed Apple-tree borer that is doing the mischief. This borer comes from eggs that are laid by a striped beetle with long antennæ or "horns," and on the trunk near the surface of the ground. The tiny borers soon eat into the tender bark and as the season progresses they get into the sap wood. They live two years in the tree and the second Fall they burrow upwards in the wood, sometimes tunneling six or more inches above the collar of the tree, and lie there dormant in the chrysalis stage until Spring. Then they emerge as striped beetles and the females soon lay their eggs. The best and only remedy is the knife to cut and a limber wire to follow the burrows when they are deep, after they are once in the tree. The trees should be carefully gone over with these tools every Spring, and when they are clear of insects wrap stiff paper tightly about the trunk from a little below the surface of the ground to nearly a foot above it. This prevents the beetles from laying their eggs at the place where nature indicates, and in case they are laid it is easy to find the borers. Mounding with earth is about as good. The trees should also be critically examined for young borers every Fall.

FARMERS AND WAIFS.—I saw a piece in your paper last week about farmers who complain about the wrongs of society and are doing nothing to prevent orphan and neglected children from growing up as best they can, and becoming a dangerous class of citizens. I want to say that such may be the case in the State of New York, but it will be found entirely different in the western part of Massachusetts. There are 60 city children to be found in two small towns in this part of our State. These children are in nearly every case treated as a member of the family in which they live, they are all influenced to attend church and Sabbath school; some of them have settled on our farms and in our villages, and have become honest, reliable, Christian citizens, while others have been adopted by our farmers and are being brought up and educated to fill responsible positions. In the past 25 years my parents have had five such boys in the family, one remaining seven years, and said it was the only home he ever knew. Three of these boys I am sure will make honorable citizens. If the writer of that article would investigate this matter during his Summer vacation he would find that the farmers were doing their "duty to country and humanity." F.

Massachusetts.

R. N.-Y.—We know of course that there are thousands of farmers who do their full duty toward such children. Our remarks were directed at those who do not!



CHILDS'
SO-BOS-SO
KILFLY

Cows Will Give From 15 to 25 Per Cent. More Milk

and better milk if protected from Flies by the use of CHILDS' SO-BOS-SO KILFLY.

It is a thorough fly killer and germicide, destroys all bacterial germs, insures health, greater strength and vigor to the animals, and by the absolute relief afforded to them increases the amount of milk $8.00 to $10.00 per cow during the season, making it a first-class investment. It allays nervousness in horses as well as cows, and keeps both in better general condition by the comfort it gives. As an antiseptic and for scours in calves, hog cholera, swine plague, and foul in Cattles' feet it is unequaled and may be used either in the stable, cow-shed, chicken house or pig pen. It is easily and rapidly applied with Childs' Electric Sprayer, and a herd of 30 to 50 cows can be sprayed in a few moments. Prior to the invention of SO-BOS-SO KILFLY and the Electric Sprayer there was nothing on the market that would successfully combat the annoyance and loss occasioned by flies and insects. SO-BOS-SO is absolutely harmless to man and beast. Abortion in cows, which is caused by a germ—propagated by unsanitary conditions—can be prevented by the use of SO-BOS-SO KILFLY.

Sold only in gallon cans. Ask your dealer, or send $2.00 for one gal. can and Electric Sprayer complete, securely packed and express paid to any point east of Mississippi river except State of Maine. The sprayer can also be used for spraying potato vines, bushes, trees, etc. Beware of imitations.

CONVENIENT. CHEAP. PRACTICAL.

Thousands are in use in America, Canada and Mexico. Shipments have begun to Cuba, the Philippines, South America and Australia.

The following testimonials speak for themselves:

MUNHALL, Allegheny Co., Pa., July 7, '99.
I received the So-Bos-So Kilfly and Sprayer and am very well pleased with it. I have a herd of 27 cows, and when we put them in the stable to milk these hot evenings, flies torment them very much, but a few minutes with the sprayer and all is quiet, and we can then do our milking in peace. JAMES C. KEARNEY.

LOWELL'S STATION, PA., April 18, 1900.
We can highly recommend So-Bos-So Kilfly as by keeping off the flies it increases the flow of milk and insures comfort to the cows. If So-Bos-So Kilfly is used on cattle during the summer, it will undoubtedly keep them free from lice and scurf during the winter.
C. F. MCCRAY & SON, Maplewood Stock Farm.

PITTSFIELD, MASS., April 28, 1900.
We have found the So-Bos So Kilfly to be an excellent article doing perfectly the work intended. Our customers report that it protects the cattle from flies very thoroughly, and consequently increases the flow of milk. Another great point in its favor is that it is reasonable in price. In some instances, it has been used quite extensively on horses. One of our customers wishing to photograph his team found it necessary to use So-Bos-So Kilfly with successful results. HOWARD & MORROW.

PHILADELPHIA, PA., May 2, 1900.
Last July the daily quantity of milk produced by my Chester County dairy fell off very considerably, which I attributed to the annoyance which the cattle received from the flies. About half the time the herd was standing in the stream switching instead of grazing. I ordered a sample of So-Bos-So Kilfly and by having it applied every second morning, greatly relieved the herd and increased the milk product from 15 to 25 per cent. and I have continued to use So-Bos-So Kilfly during hot weather ever since that time. Our herd of about 20 head could be sprayed in the stable in less time than it would require to milk a single cow, and I consider that I have saved many times the cost of the So-Bos-So Kilfly used, in addition to affording comfort to the herd.
G. S. W. BRUBAKER.

LENOX, MASS., April 21st, 1900.
I have used So-Bos-So Kilfly with good results. It is a comfort to both man and beast at the milking time.
JACOB STRIBEL, Supt. to the Hon. John E. Parsons.

The Cornell Reading Course.

Edited by John Craig, Professor of University Extension, and Editor Farmers' Reading Course, Cornell University, Ithaca, N. Y.

ORCHARD COVER CROPS.

The subject of orchard cover crops has excited a good deal of interest this year, and perhaps fruit growers are paying more attention to that question than ever before. I have been very anxious to obtain the coöperation of interested fruit growers throughout the country in testing a number of cover crop plants. With this object in view I have sent the following circular to a number of leading orchardists. It has met with a very gratifying response, and I feel certain that by the beginning of next season we shall have collected a considerable amount of valuable data. The circular is inserted here, not so much for the purpose of suggesting that we shall be glad to extend our experiments, but to encourage growers to try the series of experiments for themselves.

How to preserve a proper balance of the elements of fertility in an orchard soil is one of the most important subjects claiming the fruit growers' attention at the present time. Much can be accomplished by the judicious use of cover crops. The plants which are used for the purpose may be divided into two classes. This division is based on their power to collect nitrogen on the one hand, or consume it only, on the other. The legumes—clovers, peas and beans—collect and store up atmospheric nitrogen in excess of the amount they consume; while rye, buckwheat, oats and rape do not, so far as is known, consume more than is sufficient to enable them to perform their life functions. The legumes are therefore the richest green manures. Aside from the manurial value of the legumes—especially the clovers—their deep-rooting habit improved the physical condition of the soil to an important degree.

EXPERIMENTS SUGGESTED.—Plow or harrow the orchard early, and keep the soil in a perfect state of tillage up to the middle of July. If it has been plowed in Spring the surface should be thoroughly fined by frequent harrowings. Surface tillage is required, not deep cultivation. Sow cover crop between July 15 and August 1.

Plot 1. Cow peas drilled or broadcast at the rate of 1½ bushel per acre. If the soil is dry drilling is preferable; if reasonably moist broadcasting and rolling will answer.

Plot 2. Cow peas 1½ bushel, Red clover six pounds per acre. Cow peas drilled, clover broadcast and then rolled.

Plot 3. Hairy vetch (Vicia villosa) 1½ bushel per acre, drilled.

Plot 4. Alfalfa 12 pounds per acre; Red clover eight pounds mixed and broadcast together and rolled.

Plot 5. Crimson clover 20 pounds per acre, broadcast and rolled.

GENERAL REMARKS.—Each plot should contain not less than one-tenth of an acre, and may be as much larger as convenience and inclination dictate. If your trees are making satisfactory growth, they may not need the nitrogen furnished by the above crops. But a crop of some kind should cover the ground in Winter. Rape or rye may be sown as late as September 1 with fair results. Careful notes should be made. These should cover such points as time of seeding, date of appearance of young plants, character of growth, kind of cover afforded, height of plants when touched by frost, effect of frost, and finally how the various plants wintered.

ADVERSE EXPERIENCE.—A letter received a day or two ago suggests that cover crops should be used with certain limitations. This man (a peach grower in the central part of the State) writes me that last season he cultivated his orchard thoroughly during the fore part of the season, and then on one-half of it broadcast Early Essex rape. The season was excessively dry. The rape did fairly well under the circumstances. It was pastured with sheep in the Autumn. The other part was cultivated till midsummer or a little later. The orchard site is dry and gravelly. Now comes the curious part of it. This year over 30 per cent of the peach trees on the part of the orchard sown to rape are dead, and five or 10 per cent in a sickly condition, while those on the clean, uncropped ground are in fair condition. This would look like a clear case against the cover crop, and it is possible that there is a reasonable explanation based on the moisture question. Last season, as stated, was exceedingly dry; the trees needed all the moisture there was; the rape proved a too successful competitor, and the vitality of the trees was so lowered by the time Winter arrived that they were unable to withstand the usual low temperature. In this case a cover crop should have been planted in such a way as to admit of cultivation. If cow peas had been put in, for instance, drilled in rows far enough apart to admit of the passage of a horse cultivator, we could have had our cover crop and saved our moisture as well. A little lesson of this kind is important.

Weeds; Bushel Crate.

I send you some weeds that I wish to have identified. Nos. 1 and 2 are bad weeds. Can you give the size of a crate that will hold just a bushel level full of anything that has to be rounded up in measuring, such as potatoes, apples, etc.? That is, how many cubic inches in such a bushel? H. L. J.

The plants received are three more or less common farm weeds. Curiously enough two of these specimens are tramps from Europe, and these are the two worst. No. 1 is mayweed, which botanists call Anthemis Cotula. It is an annual and bears an ox-eye daisy-like flower and is fonder of moist and wettish places than dry land. No. 2 is a member of the Mint tribe. It is known to farmers by the name of dead nettle, while botanists glorify by the name Lamium amplexicaule. This is also a tramp from across the water, and is a biennial. It, like the mayweed, prefers moist land to dry land. No. 3 belongs to the Crowfoot tribe. It is recognized generally by the name of Bristly crowfoot (Ranunculus). There is only one remedy for this class of weeds, and that is hoed crops and good cultivation. The first two weeds are not eaten by domestic animals; neither is the last one, which is a sort of waste drylsh land plant. If good cultivation with a proper rotation of crops is given, no trouble will be experienced.

One bushel contains 2,150.42 cubic inches dry measure. For instance, a box 17x14x9 inches will contain approximately one bushel. In Connecticut and Kansas the heap bushel contains 2,564 cubic inches. In New Jersey, Pennsylvania, Nebraska, Tennessee, Missouri and Washington it contains 2,150.42 cubic inches.

HORSE SHOE FARM NOTES.

Saturday night, June 2, after supper, I took a hoe and went over my fields, making little channels to let the surplus water out of the holes, and turn the temporary streams off from the potatoes and grain. "Never saw so much water in these fields," I grumbled, as wearily I plodded home through the mud at 8.30 P. M. The stars were shining, and I hoped for better weather. Only a sullen, occasional roar in the far west indicated there might be a clearing shower before a change. No corn planted, beets unsown, weeds getting ahead of the newly-set strawberries; I do not see how things could be much worse, were the moody reflections of a cross, tired man, as I prepared for bed, at 9.15 P. M. In 15 minutes more it was raining; hail was beating against the house, and the flashes of lightning drove the household from their beds to the sitting room, except myself. I always have felt safer in bed; was tired and had seen all the rain I wanted to.

All at once I heard, away up on a hill, the steady roar of what I thought was wind, and as it came closer, there was something unusual about it which made me shiver down into bed and think: "When it strikes, the house will go!" A second more and it was past the house. I jumped from bed, half dressed, ran down stairs, lit a lantern, opened the door, and the storm was over. The wind did not blow, and but very little water was coming down. At 9.45 P. M. it was starlight again. Hearing a noise in the cellar we found the flood had broken in the southwest windows and filled that end of the cellar with dirt and stone. The incubator, in which the chicks were just hatching, lacked just an inch of being filled through the ventilator. The stone carried across the cellar blocked the back door, which is luckily on the level of the floor, and we had to cut a hole out of the bottom from the outside to let the water out. At 1 A. M. we had enough water out, so we could start the lamp again. But little water came into the house, because the stone and mud banked up on the porch, stopping the crack under the door and turning the water to one side. In the morning we found two enormous ditches the whole length of the hillside, and probably 600 loads of stone deposited in the road, yard and field. Crops were torn out, covered over and ruined to such an extent, we seemed to be wearing colored glasses of blue. Stones too large to lift, holes nine feet deep, trees uprooted and a half acre covered with stone, all done in 15 minutes, attest the power of the forces of nature.

Sunday was a day long to be remembered, and the peril seemed to grow, the more I looked it over. Man can accomplish much, but his efforts are puny beside rushing water. Monday I worked so hard I had no time to worry, and with a kind neighbor's help we drew 45 two-horse loads of stone and mud from in front of the door. What a blessing labor we so often grumble at, may be. I was heavy hearted, but slept in spite of the mind cloud which hung over me, thanks to the work. A friend came to see the ruins and remarked: "A thousand dollars will not make this good, but I would pay it and agree to wheel it all away in a wheelbarrow if I could have my wife back again." After he had gone I grew ashamed of my hard feelings over my little misfortune, and a spirit of thankfulness came over me that we were all spared to plan and build over the ruin together. The second cloud was burst by sympathy for another, and as the sun shone the grass looked green again. The dirt drawn from the yard covered an unsightly stone pile along the road side, and when seeded will be easily mowed with a machine. I have wanted to cover them for three years, but could not get time. The stone and gravel in the cellar, after removing the mud, will make a splendid foundation for a cement floor, and it's all in there for me. The road commissioner has agreed to set a stone crusher in the meadow and use the debris for road making. Already the effort to overcome the effect of the forces of nature is creating a new interest in making things better than before. We have many stones and are sometimes bothered for a place to put them, but a place is provided now in the two big ditches that will last for several years.

There were 100 chicks in the incubator when I waded to it Monday. Things might be worse. A hen turkey with 15 three-day-old chicks sat in the henyard and faced the storm. The overflow from the main torrent nearly engulfed her; but she hugged the ground the tighter and faced the danger to protect her young. In the morning she was half buried with mud and had to make considerable effort to get loose. Only two chicks were dead, and they had been smothered by her successful effort to keep out the water; an example of pluck and affection worthy of notice. She did all she could, and would have given her life to preserve her young. My father came over and said: "Here is some cash to aid in getting things in shape again. You will need it more now than later." Fathers and turkeys think more of their children than they show or get credit for, sometimes, and I write of this only to remind parents that they should not wait for a cloudburst to wake them up to the fact that loving words and stray dollars will do the children more good *now* than when they do not need them.

C. E. CHAPMAN.

Beautiful Strawberries in 1902

We can furnish you with pot-grown Strawberry Plants that will bear a full crop of fruit next year. Celery and Cabbage Plants. Full line of Fruit and Ornamental Stock. Write at once for our Summer and Autumn catalogue. It explains all. Fruit packages of all kinds for sale at low prices. T. J. DWYER & SON, Orange County Nurseries, Box I, Cornwall, N. Y.

We find that whenever a man fails to pay for a scale that it takes the profit on about five more to make up the loss. Therefore we can make more money to sell two scales at less price than six at full price. Jones of Binghamton, Binghamton, N. Y., will tell you all about it and Jones he pays the freight.

PLANTS—Tomato, Cabbage, Sweet Potato, Pepper and Celery. Price-list free CALEB BOGGS & SON, Cheswold, Del.

100,000 POTTED STRAWBERRY PLANTS. List free. T. C. KEVITT, Athenia, N. J.

STARK TREES SUCCEED WHERE OTHERS FAIL. Largest Nursery. *Fruit Book Free.* Result of 76 years' experience. STARK BROS., Louisiana, Mo.; Dansville, N.Y.

Ginseng Stock for Sale. My own growing. Orders booked now for delivery September 1. Send stamp for catalogue. GEO. MUDGETT, Johnstown, Pa.

Transplanted Celery Plants—Parties intending to set, write Frank Shearer & Son, Binghamton, N. Y., for prices on stocky transplanted plants.

CELERY PLANTS ONLY $1.00 per 1,000; one million ready July first. 100 *Strawberry Plants*, in pots, for $1.00. SLAYMAKER & SON, Dover, Del.

CELERY PLANTS.

Grown by the acre, on fine irrigated land. Extra large root development. Large stocky plants. Shipped safely to all parts of the United States and Canada. White Plume, Golden Self-Blanching and Giant Paschal. Price: 500, 75c.; 1,000, $1.25; 5,000, $5. WILSON BROS. & CO., Tecumseh, Mich.

Celery and Cabbage Plants for Sale

Leading varieties, carefully packed with moss in baskets, f. o. b. here. 250 plants at 60c.; 500 for 90c.; 1,000 for $1.50. Special price on quantities over 6,000. Cash with order. Plants ready 15th to 20th of June. WOODLAND FARM, Canastota, Madison Co., N. Y

CABBAGE PLANTS

Leading varieties, 75c. per 1,000. Shipped safely anywhere. A. B. KATKAMIER, Macedon, N. Y.

Home-Grown Crimson Clover Seed.

Choice Japanese Buckwheat. Seed Wheat and Winter Oats. J. E. HOLLAND, Milford, Del,

NEW CRIMSON CLOVER SEED

My own growing. Ready July 1. Orders booked now. Sample and price sent for approval before shipment. Cow Peas. Soja Beans. Circular free. E. G. PACKARD, Seedsman, Dover, Del.

RUBEROID

THE POULTRY-HOUSE **ROOFING**

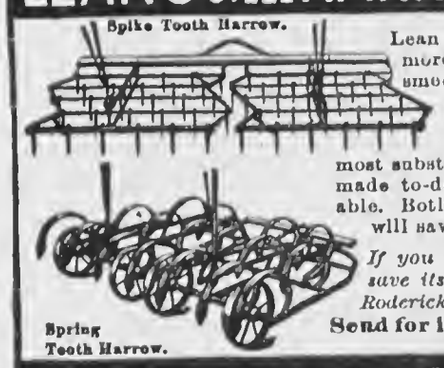
As a water-proof covering for Poultry-Houses, RUBEROID has no equal. Keeps the houses cool during the warm weather, and warm in Winter, and the chicks dry and comfortable. The sun cannot melt it.

THE STANDARD PAINT CO., 100 William Street, NEW YORK.

SLUG SHOT Kills Cabbage and Other Worms in the garden safely and cheaply. SOLD BY SEED DEALERS. For Pamphlet address B. Hammond, Fishkill-on-Hudson, New York.

LEAN'S ALL STEEL HARROWS AND LAND ROLLERS.

Spike Tooth Harrow.



Spring Tooth Harrow.

Lean harrows make fat harvests. They do more work and do it more efficiently than any other harrow. They tear up the ground, smooth it for sowing, harrow in the seed, kill the weeds after the crop comes up. The teeth are adjusted to suit any condition of the soil. By a touch of a lever they are instantly cleared of trash without stopping the team. The most substantial and finest finished farm implements made to-day. Made entirely of steel, light and durable. Both the spiked tooth and spring tooth harrow will save enough in a year to pay for itself.

If you want a Land Roller that will save its price in a single season, get a Roderick Lean Steel Land Roller.

Send for illustrated catalogue to-day.

Steel Land Roller

RODERICK LEAN MFG. CO. MANSFIELD, OHIO.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

EFFECTS OF THE PETROLEUM SPRAY.—Soon after Prof. J. B. Smith, of the New Jersey Experiment Station, recommended crude petroleum as a remedy for San José and other destructive scales, he was horrified to find successful users advocating it as a cure-all for the diseases afflicting fruit trees, so marked was the occasional increase of vigor following its application. It is true, many trees were injured or killed outright, but in all investigated cases, it was found that old or thickened oil had been used. The trees sprayed on the Rural Grounds last March, consisting of Abundance, Satsuma and Bailey Japan plums have now the darkest and most luxuriant foilage of all. We do not think the oil can add anything to the vigor of the trees, but the thorough applications we gave, going over every twig twice, have not only exterminated the scales, but surely must have buried beyond all resuscitation any fungus spores that adhered to the bark, as the surface is still coated with paraffin, which will remain, according to previous experience, until late next Spring. The incessant rains that prevailed through April and May favored the extension of fungus troubles, and the foliage of the best of the unsprayed trees of similar varieties show the result of their attacks. While Prof. Smith is the last authority likely to claim fungicide properties for petroleum and much regretted the early dissemination of all reports of increased vigor following its use it is quite possible that it may prove more efficient in this respect than he is willing to admit. Fungus spores, like seeds of higher plants, require moisture for their germination, and a coating of oil or wax may be as efficient in preventing growth as if there was some chemical action, which is highly improbable. It is not safe to recommend an annual oil bath for trees affected with anything less deadly than the Pernicious scale, but in view of its seeming persistence in keeping off dangerous bark-inhabiting insects and the possibility that it may cover up and render inert the Winter spores of such destructive fungi as the brown rot, Peach leaf-curl and the shot-hole disease of the foliage, some careful experiments are in order. Bordeaux Mixture, now the chief reliance for combating these minute pests, is effective where it hits, but is very fugitive in its effects, being easily washed off by a heavy rain, while oil persists for many months. There is yet much to learn about mineral oils as applied to dormant trees, but the main requisite is to ascertain its limits of safety. If increased vigor follows an application, it is not reasonable to credit it to a direct beneficial effect of the oil, but rather to the destruction of irritating parasites. If it can be shown that petroleum either destroys or seals up fungus spores, so as to prevent their development for a season, the fact would prove a strong additional incentive for its use when dangerous scales infest the tree. Here is a chance for investigation by our experiment workers.

THE LANCE-LEAVED SPIRAEA.—The true Spiræas are all desirable, low-growing, extremely hardy shrubs. They are of the very easiest culture, and remain many years in good condition when once established. The season for flowering for the different varieties runs from the middle of May to nearly September, while the colors vary from pure white to deep crimson in Anthony Waterer, the new variety of the pink Japan species, S. Bumalda. Spiræas are so varied in character that it is not easy to settle on the variety one really prefers. Fig. 190, on page 451, represents the double flowering form of Spiræa lanceolata, often catalogued as S. Reevesi. When this fine sort blooms in June, we always think it the best of all, but popular preference is usually given to the elegant S. Van Houttei, flowering a week or two earlier. This is a variety of garden origin, and is supposed to be a hybrid. It is one of the most beautiful of all hardy shrubs when its drooping branches are hidden with great clusters of snowy blossoms. The flowers are single, however, and the petals fall readily, which is not good for cutting. S. lanceolata, especially in the preferred double form, is acceptable both as a garden and cut flower. When in bloom, the plant is completely covered with little white rose-like flowers, shown in the engraving. The blooming period lasts nearly two weeks, and the plant always presents a neat appearance from the symmetrical arrangement of its narrow foliage.

A DISAPPOINTING STRAWBERRY.—When the "everbearing" European strawberry, Saint Joseph, was introduced, three years ago, great hopes were entertained that we had at last received a variety capable of bearing Autumn fruit. It was so highly recommended that many trials were made, only to end in disappointment. Saint Joseph makes a pitiably small plant, as compared with our best native varieties, though it does not lack vigor, and produces a few small, pale, but well-flavored fruits under ordinary cultivation. If strongly fertilized and irrigated during dry weather, it throws out a profusion of runners, the earliest of which bear fruit soon after rooting, thus it is possible to get a limited supply of berries in the Fall. They have the agreeable taste of the Alpine strawberry, Fragaria elatior, and it is likely that this species was a factor in the production of the new variety. Realizing last season that the good quality of the Saint Joseph was a more important characteristic than its capacity for repeated cropping, we crossed it with the Greenville, a robust and prolific native kind, of very indifferent flavor. The result as determined by the seedlings already planted is the most complete blending of desirable qualities we have yet seen in strawberry hybrids. The vigor of the plant and prolific tendency of the Greenville not only remains, but in some cases is apparently increased, while the sweetness and high flavor is fully retained. We have never seen such a promising lot of seedlings, yet it is highly probable that none may prove of commercial utility. A new strawberry must now possess many points of positive merit to justify an introduction to extended cultivation. Much experience has taught us that the high anticipations aroused by the first fruition of a hybrid plant are too often rudely dissipated by more extended trials. It is too soon to ascertain whether the autumnal fruiting tendency is to be retained in any of the seedlings. W. V. F.

APPLES IN THE HUDSON VALLEY.

Shall It Be Ben Davis?

There is no doubt that at present Ben Davis is a profitable variety of apple to grow. Whether it will continue to be so in the face of continued large plantings is now simply a matter of opinion. We have set no Ben Davis, and may have erred in judgment. In addition to Baldwin, King and Northern Spy, Jonathan does well and is a good market apple. Sutton is said to do well here and has hearty commendations. I don't think that anyone who sets either of these varieties will make a mistake.

W. D. BARNS.

Ben Davis is certainly profitable at present, but may not be in the future. It needs the whole of a long season to develop as it should, and grew finely in 1899. The flavor and appearance are dependent greatly upon foliage, which often deteriorates late in the season. Hubbardston and Sutton are strong of foliage, and very satisfactory, especially the latter, in some ways. With me Sutton is slow on its own trunk and liable to bark trouble, like King. It should be top-worked on Spy. In order of preference I would say Baldwin, Spy, Sutton, Hubbardston, King, Ben Davis.

W. H. HART.

I would not recommend to plant Ben Davis in the Hudson River Valley. Before the trees could come into bearing the millions of trees of that variety already growing in the West and Southwest, where it does far better than here, will fill the markets with all of this quality of fruit that will be wanted, in my opinion. I would plant Sutton, Haas and York Imperial. We may be too far north for the latter, but I would try it, as it is a long keeper. The Haas has sold this season for more money than any other kind, because of its beautiful color and size. The Spy is a grand apple when well grown, but under poor care it is one of our poorest apples, of no flavor or value. The King is not worth growing on its own roots in consequence of the blight of the bark next the ground which kills the tree just as it gets into full bearing. It should be top-worked on Spy or other hardy kinds.

WALTER F. TABOR.

I think Ben Davis is, and will be for some time to come at least, a profitable variety for this section. They are vigorous growers, healthy foliage and early and abundant bearers of fruit that sells at the top of the market. So long as these things are true this apple is preeminently a money maker, and I raise them for that and not sentiment. If the time comes when they will no longer sell readily I shall top-work them with some variety that will, and then be many dollars ahead of the man who has been growing apples that have quality and nothing else in their favor. I should not thing of setting either Spy or King for profit. The latter is too slow in bearing and too susceptible to scab and except in a few peculiarly situated orchards that I know of is not a profitable variety for this section. King will do if top-grafted on to Spy or Ben Davis stock; otherwise it is a very delicate and short-lived tree. The Sutton is first class, particularly when top-grafted; Hubbardston the same. I should also set R. I. Greening. I answer the above from a purely commercial standpoint as to Winter varieties. I think that the Fall Pippin, Maiden Blush and Oldenburg are all very profitable as Fall varieties. EDWARD VAN ALSTYNE.

THE HIRED MAN.—As I am a reader of THE R. N.-Y. my attention was recently called to the article on an ideal farm hand. Do the farmers who advertise for an ideal man stop to consider that if a hired man is allowed good wages with fair treatment he will be encouraged to give more and better work? It is not a one-sided affair, but there are duties on both sides. From personal observation I have found that help fairly treated has a more willing disposition to do well, and a man who is strictly reliable, and takes an interest in his work, surely ought to command better wages. It has become a well-known fact that men who employ help demand too long hours, with few privileges, and are not willing to pay for labor performed. It would be wise to remember the Golden Rule. A CONNECTICUT READER.

Hope Farm Notes

FINE WEATHER.—It came at last the second week in June, with sun and drying wind that quickly put a polish and sparkle on the woods and fields. The sun even went into that dark hole in the northwest where most of our storms come from and chased every cloud out of sight. No doubt some of us will be calling for more rain before July, but right now we are enjoying perfect June days. The poet tells us that such days are the rarest thing in nature. I agree with him when they are as well done as nature served them this year. The man who couldn't feel, 'way down to his toe, the glory and blessing of living as the breeze crept over the hill and rippled the sunshine into him is a dangerous character. He ought to be in jail, for the evil in his heart is too strong for ordinary things to overcome. If a perfect June day can't melt him—he's lost.

STONE WALL AGAIN.—Of course I am not urging any man to get down in the grass and dream away a June day while the corn is unplanted and the grass and weeds are jumping in the potatoes. I refer more particularly to Sunday, though a farmer can be thankful for good weather without losing a stroke of his hoe. I suppose I ought not to talk about my Sunday afternoons, for since I spoke of sitting on that stone wall I have felt like a target. Here, for example comes a man from Illinois:

> You probably were not aware that I was a life subscriber, and would continue it in the future if it were not for the uncertainty of it being allowed to circulate where I am going. I do not think a paper whose writers sit on a stone fence Sundays building air castles instead of taking the Bud and the Graft to Sunday school, and showing them the other side and beyond the fence would have admittance.

I still think that a man might be in much worse business than spending a Sunday hour on my hill looking off over the valley. The children go to Sunday school with the Madame every Sunday morning. On a recent Sunday the Bud had a sore foot, and could not go. I put the little saddle on the pony and, with the Bud on his back, while I held the halter we wandered over the hills and through the woods for hours. We would stop now and then to let Peter eat while we sat on walls or logs and talked the things which come so readily to a man and his little girl. A child that cannot pick up a more thoughtful view of life or gain some little strength of character from looking over the great, beautiful stretch of country that lay below us would hardly be worth raising! As to the circulation of THE R. N.-Y. in the great, mysterious "undiscovered country" I know nothing about it. I feel pretty sure that people will not be able to take their gold, their selfishness, their profit or their bigotry and narrow creed along with them. As for the love, sacrifice and humble contentment I hope that will go.

FARM CROPS.—The ground is thoroughly soaked after our long rains. I think there is moisture enough in the soil to mature a crop of corn or potatoes if we can hold it there. Our soil is naturally heavy. Stony soils usually hold moisture well. As soon as the soil would stand it we got into the potatoes with the cultivators. With Dan and Nellie on the double cultivator and Frank escorting the single a big area could be worked over in a day. It was a bright, windy day just right for killing weeds. The potatoes are in hills, and we shall ridge up around them a little at each working. . . . We finally planted five acres of corn by June 7. In seven days it was up nicely, and is growing rapidly. This corn was all tarred and the crows have no use for it. This corn is at the top of a high hill, and I expect it to make grain—also four acres more lower down. I shall plant our flint corn up to July 1. . . . Our first grass was ready to cut by June 20. I believe in cutting grass early when the weather is right for it. Our rye and Crimson clover was cured in the cock this year. It lay on the ground long enough to wilt and was then raked up into large cocks. These were opened or turned over to the wind several times, but not spread out. In spite of the wet weather this fodder cured well. It is a great mistake to sunburn hay. I was at a fair once where a number of men were talking of farm work. "I'm a farmer," said one, "see how brown my hands are!" He held his hands out—backs up. A quiet old farmer stepped up, caught one of the hands and turned it. "Turn them hands over!" he said. You see a baseball player or a golfer or even a dude might sunburn the back of the hand, but the true badge of farming was the callous on the palm! Some people go so far as to think hay is not properly cured unless it is as brown as old straw. The cow knows better—she wants the green color and the sweet smell. . . . This is to be a fearful season for weeds. They are getting a great start, and they enjoy the sun as well as the next plant. We are using the weeder wherever we can, but there will be much hand hoeing in spite of all. Three days after the corn was planted Charlie went over the field with the Acme harrow, and thus killed millions of the little weeds. . . . It is almost impossible to find a Cabbage butterfly this year. Usually they are here by the thousand at this time. Potato beetles have been kept back by the wet season, but we now find plenty of hard-shelled rascals, and their children will rise up to curse us later.

GREEN STUFF.—Our first early peas (Alaska) were ready June 19. This is later than usual, but earlier than we hoped for at one time. The first mess of peas makes an event with our family that is worth recording. . . . Turnip greens were ready June 14, and the little turnips will follow quickly. I am very fond of boiled turnip tops. . . . Beets are late this year. They grow slowly and our own crop will not be ready for some days yet. Nothing can be finer in the season than the first inch beets boiled until they are tender and well pickled. . . . Those Florida cabbage plants are doing well. They began to head up early in June and have made a good growth from the start. One of our friends in Dakota says this:

> I don't think it fair to New Jersey to put New Jersey hotbed cabbage plants by the side of outdoor grown Florida plants. I think the test would be fairer if outdoor or cold-frame New Jersey plants were used.

Of course I want to give New Jersey every chance she is entitled to. It may be that plants sown in the Fall and wintered over in the frame would beat the Florida plants sown in the open in January and reset several times, but as compared with our Spring-started plants, I think Florida will win, though it may cost too much to get them here. . . . Some of the Lima beans required several plantings this year before we could hope for even a fair stand. We have it at last and with the return of the sun the beans are fairly dancing. That's good—for they will be bread and meat to us in August.

CUD AND KICKING.—Three things connected with our life at Hope Farm seem to have stirred readers up with a long stick. I told about spanking the children and several good friends seemed willing to undertake the job of giving me a dose of the same medicine. I sat on a stone wall of a Sunday afternoon and thus sat down on a whole regiment of pet theories and ideas. I spoke of Julia, the kicker, and straightway I learn of dozens of such animals. I am led to conclude that spanking, philosophizing and kicking are both popular and unpopular, with strong partisans on both sides. Here is a good one:

> I see you had some experience with a kicking cow. I broke in eight heifers this Spring, and six of them were reasonably quiet, but two were kickers. One of them was the worst case I ever saw, without any exception. She was large and strong as an ox; she would not own her calf; if it came near her she kicked it clear across the stable. I put that cow in her stanchion and pushed her around against the stanchions and strapped her to them so she could not throw herself or lie down; then I tied a rope around the leg next to me and pulled it back and tied it fast about right to milk her. She kicked and flounced and tried to lie down. I kept right on milking. She could not bring her foot forward any more to hurt me. After a week's milking she gave up, and now she walks right into the stable and puts her foot back as gently as any cow could to be milked. The other kicker gave up much sooner. I have always noticed that when a cow chews her cud there is no kick in her heart, and when a cow does that it is not necessary to have a rope on her any longer. A. L. S.
>
> Huron Co., Mich.

That is about the way we made Julia quit—prohibition did it. The relations between cud and kicking are too much for me. In my younger days I once saw a prize fighter preparing for the ring. He chewed gum continually. While meditating and planning for his hardest blow he kept his jaws at work. He claimed that this working of the jaws overcame his nervousness, deceived the man he was trying to hit, while the mass of gum might ease a blow on the mouth. I have never had occasion to try it—but it looks reasonable. Julia is mean enough to chew the milker off his guard and then put her foot 'way through him. The "cud" is really a wad or parcel of "grass hash" floated up from the great stomach of the cow within reach of her tongue for chewing over. If some men I know could reach back into their past actions and bring up a mental cud for rethinking I should think they would aim several hard kicks at themselves.

H. W. C.

DOUBLE SUNSHINE.—We had just finished reading Hope Farm Notes and were trying to bask in its imaginative sunshine, and wearily watching the dripping trees, as we have been wont to do for days and days, wondering when real sunshine would come. As we have suffered from a climatic disorder for several weeks, and were waiting for Nature's great physician, the sun, perhaps impatiently, the male portion of our neighborhood came stalking into our yard with axes and saws, and at once pounced upon our (un) fortunate pile of logs that had been secured at our last sleighing. It is needless to say that our log pile was soon transformed into a goodly wood pile, and though the lowering clouds did drip a little, it was hard, very hard, to rain where there was so much sunshine. In the afternoon the clouds broke away and there was more sunshine, and we just felt thankful for two kinds of sunshine, and that we could enjoy them both. J. A. O.

STUDEBAKER "20TH CENTURY" WAGON

AFTER FIFTY YEARS.

At the end of fifty years of continuous wagon construction, every one of which has been crowded with conscientious effort for the bettering of our product, we bring out as the accumulated experience of all those years this **"Studebaker 20th Century Wagon."** There is not the smallest detail or part entering into its make up that is not the best that **design, material, workmanship, finish, experience** and the advantage of the **largest and most complete factory in the world can make it.** In consequence it is the best wagon that can be made. Of those who bought the **"Studebaker"** 30, 20 and 10 years ago many are still using them daily and find them strong, efficient and enduring up to the present. Well, this wagon has all the good features of the old, besides many new improvements. Ask anybody who uses a **"Studebaker"** how he likes it. We will abide by his decision. Go to your nearest dealer and ask to see this new **"20th Century Wagon."** If you don't find it there write us direct, we'll give you the name of nearest agent where you can see it.

Studebaker Bros. Mfg. Co., South Bend, Ind., U. S. A.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER.

A National Weekly Journal for Country and Suburban Homes.

Established 1850.

HERBERT W. COLLINGWOOD, Editor.
DR. WALTER VAN FLEET, H. E. VAN DEMAN, MRS. E. T. ROYLE, } Associates.
JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, JUNE 29, 1901.

INDICATIONS multiply that, as a whole, the apple crop will be short. Early apples ought to bring more money than usual. We do not go on record yet as predicting a very short crop, for the outcome is many days away yet. The chances are, however, that good apples will be scarce. This will be a good year for drying some of the fruit that would be thrown away in an ordinary season.

*

ONE of the greatest industrial developments of late years is the use of cement for building purposes. There has been such a sudden increase in the use of this material that in some sections the lumber trade has been affected. Thomas A. Edison now announces that he has discovered a new process of making Portland cement which will greatly cheapen the price. If this prove true still more cement will be used, and we may expect to see outbuildings and dwelling houses made for a very little money, and by ordinary farm labor. This will probably benefit farmers more than any other class.

*

BEFORE the fate of the Grout bill was settled THE R. N.-Y. began to protest against the reappointment of J. W. Wadsworth as chairman of the House Agricultural Committee. For months we protested alone —now help is pouring in from all sides. The New York State Grange has issued a strong call to arms—which in this case means a call to pen and ink. The agricultural papers are falling into line. We urge all who are interested in the cow to begin at once to *vote with the postage stamp.* Wadsworth should be put back in the ranks. When Speaker Henderson returns from Europe he should find his desk hidden beneath a flood of strong letters protesting against Wadsworth as chairman. Vaccinate Mr. Henderson with ink, and he will be made immune to the oleo disease.

*

FARMERS and truckers through the manufacturing section of New Jersey complain bitterly of the losses they sustain from petty thieves, who loot both fruit and vegetable crops, even going so far as to dig potatoes out of the ground. They say that the worst offenders are Italians of the lowest class, who spend their leisure in scouring the country, picking up everything that they can find. Even when caught in the act of robbery, the farmer has no redress, being unable to name or locate the depredators when trying to get a warrant for their arrest. An attempt was made to pass a law permitting farmers to be sworn in as special constables, that they might have power to arrest such thieves without the delay of seeking a warrant. This law, however, failed, and it is said that the chief opposition to it came from local justices, who feared that they would be deprived of their fees, by thus giving farmers the right to protect their property. The farmer's property right is expected to stand back for the man with a political pull.

*

WE have heard of an old farmer who became tired of farming, and had a longing for town life. He engaged a real estate agent to advertise and sell the old homestead. This man had little sentiment about him, but he knew what appealed to buyers, and he wrote a description of the farm and printed it. When the paper containing the advertisement came and the wife read it aloud, the old farmer sat silent in his easy chair for a long time. At last he said: "Mother, that's a description of our farm, is it? The grand old lane—fine orchards of all kinds of fruits—cosy homestead, surrounded with magnificent trees and shrubs —an ideal spot in nature, eh?" "That's what it says here," answered the wife, as she looked out on the sloping green pasture field at the cows contentedly chewing their cud under the shade of an elm tree. "Well," said the farmer, "I'll countermand the order, for Old Elms Farm is not for sale. If others see all these attractions on the old farm, why they must be here. We've kinder grown up with them, and didn't notice 'em. I guess it's good enough place for us to end our days on, too." There was a man whose life had grown on so softly and slowly amid familiar scenes that he could hardly realize the beauty and peacefulness of his home until they were pointed out by others. It is a sad thing that so few farmers can fully enjoy and appreciate nature in all its bountiful beauty. The dollar and cent vision will, if we permit it, cloud over and obscure the best things of farm life—best because something better than gold must be paid for them.

*

ON page 450 is an account of a 100-acre farm in New Jersey from which $3,000 worth of farm products were sold last year. This money did not come from sales of fruit or truck or other special crops, but from the common farm crops such as grain, hay, potatoes and milk. It would be a sad mistake simply to give these figures and then leave it to be inferred that any 100-acre farmer who fails to do as well is falling short of his possibilities. That is the feeling left after reading some reports of farm operations. It is easy for any practical man to see that such conclusions are wrong. There are dozens of important things back of the $3,000 income from the New Jersey farm which must be taken into account. In fact, when you come to analyze any great farm success you will find that special conditions of soil, locality or markets have much to do with it. We believe that much harm has been done in the past by the recital of glowing accounts of what successful farmers have done without a fair analysis of the reasons for success. We have heard much about the advantages of the Far West as a grain region. Can any western reader give us the record of a 160-acre farm that produces a more valuable crop of farm staples than this New Jersey homestead?

*

CONSTANT references are made in the public press to the great National prosperity we are enjoying. We are exporting unheard-of amounts, and capturing the commerce of the most enterprising trading nations. We are buying back our own shares and loaning money to great foreign enterprises. Our industries are earning unprecedented profits, and the dividends to be paid by the great trusts and corporations in July are to break all records. Everything is booming, and the prices of stocks are higher than ever. All this is very gratifying, but how does *your* share of this prosperity figure out? It is not to be denied that labor is more generally employed than for the last nine years; that consumption of commodities is in a measure keeping pace with the greatly increased wage of the producers. This is gratifying while it lasts, but one of the best tests of real prosperity can be found in the selling price of farm lands. Are productive farms more readily sold than in recent years? We do not find it so. If a corporation, or wealthy individual wants land for some particular purpose, a sale is quickly made, but there is little demand for farms for agricultural purposes except in certain localities peculiarly well adapted to fruit growing or some special crop. We would like to obtain statistics from readers. Has the value of farm land for agricultural purposes increased in your locality?

*

THE papers are full of reports concerning the scarcity of farm help in Kansas. Somehow Kansas always succeeds in advertising her wants and needs, but farmers of other States are just as badly in need of help. Wherever we go we find farmers worrying because they cannot find suitable help in house and field. In parts of Pennsylvania clergymen and others are writing to the New York papers begging the city unemployed to come to the farms. One such letter reads as follows:

> Help was never so scarce, especially house help for the farmers' wives. You have thousands of unfortunate workers in your city who would be better off in the country. The railroads offer them half fare, and the farmers and their wives will give them work and wages and good homes here. Women, or men with wives but *without children*, are especially in demand, as they can go right into the homes and live with their employers.

"With wives, but without children!" There is the same old provision which has done so much to drive some of the best of farm hands away from the farm. The poor little child is barred alike from the broad farm and the narrow city flat. What a difference there would be if a comfortable tenant house could be built on the farm so that the workman could live with his own family. Just now the city is a poor place in which to hunt for farm laborers. We receive letters from men in the country who ask whether they cannot find profitable work on the new tunnel. Our advice is to stay away from the city. The good jobs are all taken up. There are, or ought to be, far better chances on good farms.

*

THE complete census returns give some interesting figures for comparison. The total population of the country on June 1, 1900, was 76,303,387, including Alaska, Hawaii and the Indians. This is a gain of 21 per cent during the past 10 years. We give below the figures showing how the older States have increased in population during the last century. In 1800 there were 21 States, and we have compared the census figures for 1800 with those of last year:

State.	Population. 1900.	Population. 1800.	Per cent gain, 1900.	Per cent gain, 1800.	Persons, per sq. mile, 1900.	Persons, per sq. mile, 1800.
Connecticut	908,420	251,002	21.7	5.5	187.5	51.
Delaware	184,735	64,273	9.6	8.8	94.	32.
Georgia	2,216,331	162,686	20.6	97.	37.6	2.8
Indiana	2,516,462	5,641	14.8	.....	.....	....
Kentucky	2,147,174	220,955	15.5	199.	53.7	5.5
Maine	694,466	151,719	5.	57.	23.2	5.1
Maryland	1,188,044	341,543	14.	6.8	120.5	34.6
Massachusetts	2,805,346	422,845	25.	11.	348.	52.
Mississippi	1,551,270	8,850	20.	.....	33.5	0.2
New Hampshire.	411,588	183,858	9.3	29.	45.7	20.4
New Jersey	1,883,669	211,149	30.	14.7	250.	28.
New York	7,268,894	589,051	21.	73.	152.6	12.4
N. Carolina	1,893,810	478,103	17.	21.	39.	9.8
Ohio	4,157,545	45,365	13.	.....	102.	1.1
Pennsylvania	6,302,115	602,365	20.	38.	140.	13.4
R. Island	428,556	69,122	24.	½.	407.	63.7
S. Carolina	1,340,316	345,591	16.	..,..	44.4	11.5
Tennessee	2,020,616	105,602	16.4	38.	48.4	2.5
Vermont	343,641	154,465	3.4	80.	37.6	16.9
Virginia	1,854,184	880,200	12.	17.	46.2	13.6

These figures show something of the movement of population in this country. In the early part of the last century and up to the Civil War there was a steady movement away from the older-settled States to the West. It was argued that the East would be slowly drained of population and thus lose much of its old-time character and power. The figures show that these predictions have failed. The nine North Atlantic States, Maine to Pennsylvania, contain over 27 per cent of the total population. They made a gain of 21 per cent during the past 10 years. During the same time the 12 great States of the Central West —Ohio to Kansas—gained but 17½ per cent. Maine gained five per cent, while Kansas gained less than three; Vermont 3½ per cent, Nebraska less than one per cent. The growth in the East is not confined to the towns and cities, for the agricultural counties have made fair gains. The theory has been that eastern factories would gravitate to the southern cotton fields and western mines and forests, and that food producers would be forced to migrate to the richer soil of the Far West. The actual facts upset this theory.

*

BREVITIES.

—He would not scald his cans,
But rinsed them with warm water and a rag
That once was clean, and said "That's good enough!"
And all the while, in every crack and seam
A breeding band of bad bacteria
Lurked till the milkers poured the new milk in.
Then how they went about their evil work;
Millions of tiny rascals, each one bent
On mischief till the whole big can of milk
Began to turn, and then the foolish man
Thought he could cover up his carelessness
By using some vile, drugged "preservative."
Oh! why not learn that water boiling hot
And sunshine—Nature's simple gifts to man,
Are far more deadly to the wretched imps
That sour our milk than all your poisoned drugs.

BEAT sugar—the taffy of the tree agent.

SOME "farm help" really prove a hindrance.

JUMPING out of the frying pan seldom pans out very well.

STOP planting and take care of what you have in the ground!

IN spite of favorable reports we think the hay crop will be short.

PAYING dearly for knowledge seems to be a sort of hire education.

WHEN a man's neighbors all speak well of him what do you suspect?

So it seems (page 463) that a cow is often a robber because she is robbed.

WHO has seeded Timothy and clover with buckwheat and succeeded with all three?

WHY, yes, I'll sorrow thy berry, says Mr. White Grub, as he sharpens his teeth on the strawberry roots.

WHO can tell of an easy way of getting manure out of the stable, or is this like milking, bound to be a hard, hand job?

IT is surprising how much Alsike clover one finds in grass fields. The practice of mixing Alsike with Red clover is growing.

HERE is a report on Ruby Queen rose: "The Ruby Queen rose is like the Irishman's colleen, the completist, the sweetest, the natest that's adornin' my garden today."

THE Ben Davis apple is certainly a stayer. A neighbor brought us fair specimens on June 20. They were kept in a dug-out storage house! But who wants to eat Ben Davis apples in strawberry time?

THERE are 10,602 incorporated places in the United States. They vary in population from over 1,000,000 to below 500. About 47 per cent of the total population of this country lives in these places. Ten years ago this proportion was about 41 per cent.

Events of the Week.

DOMESTIC.—A cloudburst near Bellaire, O., June 13, carried away three boys, drowning them in a swollen creek. . . . . The Mineral Springs Hotel at West Baden, Ind., was destroyed by fire June 14; no one was hurt, but the property loss was $500,000. . . . . The Staten Island ferryboat Northfield came into collision with the Jersey Central ferryboat Mauch Chunk off the Battery, New York City, June 14, and sank soon after. There were 1,200 persons on the Northfield, and a panic occurred; five persons drowned. . . . . Mayor Ashbridge, of Philadelphia, Pa., has ignored the offer of $2,500,000 made by John Wanamaker, and the protests of the people of the city, and signed the ordinances giving away franchises for 14 city railways, elevated, underground and surface. Mr. Wanamaker said he could cheerfully pay the sum of $2,500,000 but suggested that if the new ordinances required the franchises to be put up at auction and sold to the highest bidder an amount largely in excess of that which he had offered could be obtained readily. His offer, he declared, was merely an indication in concrete form of the magnitude of the gift conferred upon private citizens without return to the people. . . . . A hail and rain storm in the vicinity of Knoxville, Tenn., June 18, greatly damaged and in some sections completely destroyed fruit and vegetable crops. Wheat and corn suffered much, and there was great damage to fencing, soils, bridges and roads. The loss was over $100,000. . . . . A cloudburst and heavy floods in Virginia June 18 caused much damage. At Harrisonburg three persons were drowned. . . . . A fire in a big furniture establishment in Brooklyn, N. Y., June 18, caused a loss of $435,000.

ADMINISTRATION.—The Russian Ambassador has notified the State Department that in consequence of the American Government applying tariff restrictions against Russian petroleum, the Russian Minister of Finance has imposed the high tariff rate of the Russian schedule on American white resin, or colophony, galipot (white turpentine) brewers' pitch and bicycles. . . . . The Treasury Department has imposed a countervailing duty upon Italian beet sugar, in consequence of indirect export bounties alleged to be paid by Italy. . . . . Information has reached Washington that under a recent classification plows with one wheel imported into Italy are to be regarded as instruments for art and trade, instead of agricultural machines, and that the change involves a higher rate of duty. The United States Government is likely to protest.

PHILIPPINES.—Two officers of the War Department will make an investigation of the mysterious loss of large quantities of commissary and medical supplies on transports between San Francisco and Manila. These officers are Major John L. Chamberlain, Inspector-General, and William T. Kent, accountant of the Inspector-General's office. It is apparently the belief of officials that the losses sustained have not occurred while the transports are on the high sea, but at the ports, where opportunity arose for the quiet transfer of convenient articles to persons acting in collusion with those on board the ships. The extent of the losses suffered by the Government is not known. They are said to be large. In any event army officers say that it is the duty of the Government to make an investigation, and to stop the irregularities. Regarding the San Francisco frauds, Lieutenant-Colonel Maus, the inspector, who discovered them, has telegraphed Inspector-General Breckinridge that no commanding officers are involved, and that the irregularities are confined to the Presidio. . . . . Colonel Bolanos, with five officers and 41 rifles, has surrendered at Lipa, Batangas Province. The recent battle with the insurgents at Lipa, in which Lieutenant Springer was killed and Captain Wilhelm and Lieutenant Lee were mortally wounded, was begun by the Americans. The disproportionate number of officers hit is said to be chargeable to the fact that there were several deserters from the American army with the rebels.

CUBA.—The main obstacle to complete independence for Cuba has been removed by the action of the Constitutional Convention in accepting the Platt amendment without the explanatory appendix which was objectionable to this Government. It is not likely that a new government for the island will be established before Congress meets next December, and the earliest withdrawal of American troops cannot begin until next year.

GENERAL FOREIGN NEWS.—A fire which started in a shipyard at St. Petersburg, Russia, June 14, caused the death of 12 persons and damage amounting to 10,000,000 rubles (about $6,000,000). . . . . An explosion in a cartridge factory at Les Moulineaux, near Paris, France, June 14, killed 15 persons and injured 20 others.

FARM AND GARDEN.—The National Grain Growers' Association met at St. Paul, Minn., June 11. At the conclusion of the National convention the State Grain Growers' and Farmers' Alliance and Industrial Union held their annual conventions at the same place. This meeting was expected to be the largest gathering of farmers ever held in the country. Excursions were formed to bring them from Illinois, Iowa, Nebraska, Wisconsin, North and South Dakota and Minnesota. Among the many notable speakers were Governor Van Sant, Senator Clapp, Congressman Stevens, Archbishop Ireland, General M. D. Flower, Chief Grain Inspector Retshus, E. W. Randall, Professor Hayes and others. The Allied Agricultural Associations, which met in Minneapolis at the same time, gave a banquet June 13 to George H. Phillips, of Chicago, in appreciation of his efforts in raising the price of corn from 30 to 55 cents per bushel. He was made an honorary member of the Grain Growers' Association.

The prizes in the recent stock judging contest by the students of the Department of Agriculture of the Ohio State University were awarded June 13 as follows: First prize, Henry H. Hamilton, Brownsville, O.; second, W. B. Smith, Chesterhill, O.; third, Herbert L. Belden, Middiefield, O.; fourth, C. C. Poindexter, Parkersburg, W. Va.; fifth, M. O. Bugby, Kingsville, O. The prizes, aggregating $35, have been given annually for a number of years by W. B. Smith & Son, of Columbus, O.

The Western Seedsmen's Association is the name of a new association of 10 western seedsmen, formed in Sioux City, Ia., on June 1. Its object is to have a better understanding and feeling among seedsmen whose traveling men cover the same territory in Iowa, Minnesota, North and South Dakota, Nebraska and Kansas. H. A. Johns, Sioux City, Ia., is president; J. O. Littlejohn, Independence, Ia., treasurer; Mel. L. Webster, Independence, Ia., secretary.

The Wholesale Seed Merchants' League held a protracted meeting at Powers Hotel, Rochester, N. Y., June 14. Many matters of trade importance were up for discussion. The new members of the board of directors are: Burnet Landreth, W. A. Burpee, T. T. Maynard and H. W. Wood, the latter to fill the unexpired term of Robt. Buist. Officers were elected as follows: President, F. W. Bruggerhof; vice-president, S. F. Leonard; secretary and treasurer, Burnet Landreth.

An examination of the recently published session laws of the last Illinois Legislature discloses the fact that the game law under the statute offers no protection to quails. After July 1 next the birds may be killed indiscriminately at all seasons of the year. A number of neighboring States have recently enacted laws prohibiting the killing of quails for a number of years, and it is expected that hunters from all over the country will pour into Illinois, and that an indiscriminate slaughter will follow. Sportsmen predict that the quails will be exterminated within the next two years.

Prof. W. T. Carrington, Missouri State Superintendent of Schools, has conferred with Geo. D. Ellis, secretary of the State Board of Agriculture, and Dean H. J. Waters, of the Agricultural College, in reference to plans for the introduction of the teaching of the elements of agriculture into the rural schools of Missouri. It was agreed that Dr. Charles Thom, professor of botany, prepare a teacher's guide for plant study. Prof. J. M. Stedman, teacher of entomology, will prepare a similar guide for the study of animals and insects, which will be followed immediately without lines for agriculture and horticulture by Prof. M. R. Smith and Prof. J. C. Whitten. The State Board of Agriculture will publish and distribute this literature among the teachers who desire the work.

CROP PROSPECTS.

JUNE 10.—Wheat is badly damaged by the fly. Some early fields were broken up for corn. Late wheat is better, but is falling badly; will not be more than a half crop. The poorest stand of corn in years; cause, mainly on account of cold wet Spring, and secondly on account of planting too deep. One-horse drills are cause of deep plantings. Two-horse planters give a fair stand. Oats and grasses promise a fair crop. Peaches promise a fine crop, apples a poor one; other fruits fair. Potato crop was late in planting, but is coming splendidly now.
New Bellsville, Ind. C. W. F.

JUNE 10.—Wheat is looking well; the best we have had it in four years. No signs of insects in it yet; it was not winterkilled to any extent, and promises a heavy crop. Corn is in poor shape on account of cold weather and lack of rain. Oats are looking poorly; too cold and dry. Rye will be a light crop; has been too dry all the Spring for it to stool. Hay will be a scarce article here this year; old meadows promise nothing; some small pieces of new seeding looking well, but the majority is very poor. Potato planting is well under way. The acreage will be about three-fourths of what it was last year, nearly double the early varieties planted that were last year. Nearly all the late varieties planted will be Rural or Carman. This is a potato country, that being the main money crop. W. B.
Mecosta Co., Mich.

JUNE 11.—A good proportion of the young fruit on the apple trees seem to remain yet, especially the early fruit, as Duchess, Twenty Ounce, etc. Peaches are very scarce on the trees. Pears and quinces are promising well. Plums are blighted, and expect about half a crop. Wheat is looking very poor; the insect is working in it quite extensively. B. W. B.
Hilton, N. Y.

JUNE 12.—I think the long cold wet weather has done less damage than was expected. We in this immediate vicinity did not have heavy bloom to begin with, but there appears yet perhaps one-third an average crop of fruit. Cherries have suffered more than apples. Baldwins are grown here to a large proportion, and they are decidedly scarce; did not blossom even where well cared for. Early varieties blossomed quite profusely and are still carrying the fruit where properly sprayed. C. B.
Spencerport, N. Y.

JUNE 14.—Cold, very wet backward Spring. Corn planting not finished. Grass heavy, prospects for large hay crop. Wheat badly injured by fly; will not be over half crop in county. Farmers blue as usual; last year too dry; this year too wet. We are never satisfied. We complain too much. Let us take things as they come and be thankful. E. D.
Penn Yan, N. Y.

JUNE 12.—Apples blossomed very light in this section, excepting early fruit, which set well. The Baldwins did not blossom. Greening about one-third, and they are not setting very well. It is a little too early to tell definitely. Pears and plums have set a fair crop. Tent caterpillars have been very thick, and the canker worms are getting in their work now. Farmers are very slack in spraying this year, as the wet weather has hindered, and very light show for crop. W. P. R.
Williamson, N. Y.

JUNE 14.—Fruit trees of all kinds are quite full of blossoms, and as we had no frost to hurt the buds we expect a big crop, but the east wind and rain blasted most of the buds. There is a full crop of peaches, currants and raspberries; plenty of plums and pears on some trees; about one-fourth crop of cherries; full crop of grapes but very few apples, though the trees were all quite full of blossoms. I suppose it is better the way it is, for if there had been a full crop we would get nothing for it at all. Wheat, oats and grass are as good as I ever saw, though wheat was put in last Fall the worst way on account of dry weather. Crops depend more on soil and weather than on science. B. R.
Fayette Co., Pa.

JUNE 15.—We have 300 Ben Davis which bloomed full; nearly two-thirds of bloom false; 100 Kings bloomed full; nearly one-half were weak and fell off. Apples now on look nice. Oldenburg trees are loaded down. Our 600 Greening, Baldwin and Russet did not bloom well, and are a failure; Bartlett pear one-half crop; Seckel two-thirds crop. We sprayed before blossoms and once after, using white arsenic, sal soda and lime, which killed worms. Sprayed pears once with Bordeaux. C. M. H.
Medway, N. Y.

JUNE 15.—Farm conditions in this section of New Hampshire—near the sea—have been much the same as reported in your columns by your New York correspondents; constant foggy and rainy weather through April and May, causing most farm work to be late. Many have not yet finished planting, and there is a general report of rotted potato seed. Old potatoes scarce, and $1 per bushel in the stores. Early plantings on light land have come well, however, but are unusually infested with bugs. Much complaint from farmers and gardeners of cut and grub worms. Notwithstanding the long wet period there is now much need of rain, as we have had a fortnight of dry scorching winds, and heavy land is baked hard. Hay crop will not be heavy as the long drought of 1900 burned up old fields. There will be no apples in this section this year. Greenings, Spy and early varieties bloomed well, but the cold and wet evidently prevented setting. Farmers in this section have not yet learned to spray as your New York orchardists do. They wait until the canker worms have badly eaten the foliage and then dose heavily with Paris-green. Very few use Bordeaux Mixture. Many orchards are now brown and must be badly damaged. All in all crop prospects are not bright. Pastures that have been looking finely now need rain. D. L. P.
Dover Point, N. H.

JUNE 17.—Pears and apples except Spy and Astrachan were in heavy bloom; but not more than an eighth or tenth part of the blossoms set. A few tent worms and fewer forest worms. But little spraying was done, owing to the rain. Grass is good; corn backward. A. L. H.
Norway, N. Y.

JUNE 17.—Apples can hardly be estimated at 30 per cent; pears are a little better; cherries set full but are falling some. Small fruit is a good crop. We have had about 10 days of very fine warm growing weather and things look brighter. W. B. T.
Standing Stone, Pa.

JUNE 17.—Baldwin apples had scarcely any bloom but have set some fruit; outlook for a fair crop of other Winter varieties. Not many commercial orchards here. Peaches, cherries and plums will be a full crop. Wheat, oats and grass looking well. Corn late on account of wet season. G. W. H.
Ogle, Pa.

JUNE 16.—There will be a good crop of apples in this section, but as many growers do not spray, there will not be over 50 per cent of crop fine fruit. Peaches will be about a half crop. Frost is supposed to have injured them badly, causing them to drop, although some orchards will have a full crop. Plums are a light crop, but some orchards that have been sprayed right, show up finely. Pears, light crop; weather favorable for spraying after blossoms dropped. Hay not a full crop.
Allegan Co., Mich. H. M.

JUNE 15.—This is the regular year for apples to bear well here, and trees bloomed full and set well generally. Some are now scabbing very badly, especially Winesap. As a rule Winesap brings in more money to this section than all other varieties combined. I sprayed mine this year pretty thoroughly and it seems to have had a good effect, but has not entirely prevented the scab by any means. In some unsprayed orchards the apples are so scabby that it is disgusting to look at them. The prospect for Albemarle Pippins is first rate. Other fruits promise well. Cherries are ripening; fruit very small.
Barboursville, Va. A. R. L.

JUNE 17.—Our wheat is partly lodged, and I don't think will fill as it would if it had not rained so much. I don't think the hay crop will be as large as anticipated by a great many. The meadows are not thick in the bottom, but still it may thicken up yet. I hear of potatoes not sprouting; ours came up fairly well, but it has been so wet we could not cultivate nor hoe, so they are full of weeds, and it is not much of a year to use a weeder. Our apple trees blossomed about the time the rain commenced, and I never saw trees whiter, but the cold wet weather blasted the blossoms, so we will have no apples and not much other fruit. There is a big complaint about cows falling off in milk. Ours have shrunk from 250 to 210 quarts in the last two weeks, not doing as well as they did last June, for all it was so dry.
Hop Bottom, Pa. E. P. B.

Crop and Weather Report.

The past week on the Pacific coast has been cool, with frosts in the northern part. With the exceptions of drought in Texas and Missouri and heavy rains in the South Atlantic States, weather conditions east of the Mississippi have been favorable. The condition of corn is improving, but considerable damage from cutworms is reported in the Dakotas. Winter wheat harvest is going on rapidly in Kansas and Missouri and is commencing in the Central States, where the fly is still active. Spring wheat in Minnesota and the Dakotas is improving. Cotton is looking well except in the eastern sections of the district, where rains have prevented cultivation. The prospect for the tobacco plant is favorable, but some damage from worms is reported in the Carolinas. Apples are dropping heavily in Ohio and other States of the Central West. In New York and the New England States the hay crop will be heavy, and cutting will soon begin. Potato bugs and other insect pests are numerous. Strawberries are being marketed from southern Jersey; tree fruits are dropping badly. In Maryland and Delaware work has been hindered by rains. Hay will be light. The peach yield will be fair. In Virginia, potatoes are fine and melons fair. The Georgia peach crop has come through in fair shape so far. In May there was an extensive drop caused by curculio stinging, but this amounted to only a wholesome thinning. Some report that the size is better than last year. Cantaloupes, while several days later than last season, promise well, and the acreage is nearly double in some sections.

Woman and Home

From Day to Day.

"HANKERIN'."

May in the East! and the apple trees
White with bloom and alive with bees!
Hummin' of bees and the robin's song
Helpin' the Springtime hymn along!
Oh, 'pears to me I can hear the "zoom"
Of the busy wings in the apple bloom;
And the bumblebee with his blundering boom
In the green of the fuzzy willer!

Spring comes 'round; and the breath o' May,
Stirrin' the locks on my temples gray,
Brings me sounds from the old homestead—
Wakenin' thrills that I thought was dead!—
Sounds that ring in the Hoosier brain,
Echoing over and over again,
The shriek of the quail from the locust lane,
An' the click of the old corn planter!

May in the East! I know the best
And sunniest land is the Golden West;
But 'long at the end o' the month o' May—
Just when it's visitin' June—someway,
There's something stirs in my ole warm blood
An' makes it flow in a homesick flood,
With a hankerin' sigh for the apple bloom;
For the robin's song and the droning "zoom;"
The buzzin' o' wings and the blundering boom
In the green o' the fuzzy willer!

L'ENVOI.

For after all it's the way of all
To hear at times the homeland's call;
The red deer, warm in the sunny vale,
Longs at times for the sleet and hail;
For the dead-gray rocks on the cheerless peak;
The stinging snow and the winds that shriek
Through the deep crevasse in the storm-cloud gloam—
The scenes and haunts that he first called home!

Go North—go South, or East, or West—
It's the old home place you loved the best!
—L. O. Reese in San Francisco Bulletin.

*

A NEW neck wrap for a windy Summer day is a boa of taffeta with fringed-out edges. It is seen in all plain colors, and also in changeable silk. It is pretty and becoming, though of very little practical use.

*

WASHABLE white rugs are one of the new ideas for Summer cottages. They are merely rag carpet, made from white cotton or linen rags. They are used in Summer bedrooms, or on the veranda. Sometimes a few strips of color are added across the ends. They are easily washed and look very dainty.

*

DURING June old-time housewives used to collect and dry the leaves and stems of pipsissewa or prince's pine, which, made into a tea, was regarded as a valuable tonic, or given for disorders of the digestion. It is a useful addition to homemade root beer. The Indians used to regard the pipsessewa as possessing marvelous powers of healing, and colonial housekeepers derived their faith in the herb from the aborigines.

*

A GIRL who has collected a great many pretty sketches in black and white, most of them being from high-class magazines, devised an original manner of mounting them to decorate a corner of her own room. She secured some large sheets of gray paper, cut it into pieces large enough to form mats for her pictures, having three-inch margins. The pictures were then laid on the mats and fastened by large drops of red or black sealing wax, about the size of fifty-cent pieces. The wax was pressed down by a monogram seal, but this is immaterial. The number of seals and their position were varied as much as possible; sometimes one at each corner, sometimes less. When grouped on a wall together the effect was very good. A similar way of mounting may be used when photographs or engravings are arranged without frames upon a strip of cartridge paper stretched along the wall. A strip of dull green or gray, the full width of the cartridge paper, stretched along the wall above a divan, bearing a collection of pictures affixed with black or red seals, makes a picturesque cozy corner arrangement.

*

A SMALL girl who had been visiting her grandparents in the country was asked how she had enjoyed her visit. "Oh, pretty well," she replied, "but I'd

3836 Girl's Costume,
6 to 12 years.

like the country better if it was here in town." She is not alone in her view; a good many lonely women will echo the opinion. The best way to make country life interesting is to put some interest into it. If our life is narrowed down to one small country community there is little wisdom in deciding that real interests can only lie outside it.

*

AMONG Summer underwear we see shirt waist corset covers, which differ from the ordinary make in having three frills, about three inches deep, put one below the other across the front. They are intended for flat-chested women, to whom a thin shirt waist is an unkind revelation, and are a decided improvement upon the various mechanical deceits offered each Summer for the same purpose. The shirt waist is a leveler of feminine beauty, for its simplicity of make does not permit the various disguises of outline permitted by an elaborately trimmed bodice. Whereas a good dressmaker can bring any figure not absolutely deformed into comeliness of some sort, if allowed full latitude in cut and trimmings, the shirt waist does not permit these artifices, and is often most unkind in its revelations, like the bathing suit. Each year we notice an extensive crop of belts and fastenings for the purpose of holding the shirt waist in place. We have always believed this gear to be invented by men, to whom feminine apparel is a mystery, but, after meeting a dozen women in each block whose shirt waists always hike away from their belts, and whose plackets invariably gape hungrily open, we don't wonder that an inventive man locks himself up in a machine shop, and devises a combination vise and shafting, warranted to hold the most vociferous wardrobe together. One style offered last year suggested that steel corset with immovable hasps, invented by Catherine de Medici, which was warranted to reduce the most obstinate waist to 13 inches. Women look admiringly at these contrivances—sometimes even buy them—and then go on pinning themselves together in the same old way.

The Rural Patterns.

The girl's dress shown has a fitted lining that closes at the center front. On it are arranged the full front and the waist, which is tucked and joined to a square yoke and finished with a novel and becoming color. The sleeves include snug upper portions, with the soft cuffs. The skirt is slightly circular, with a flounce at the lower edge, and is tucked to form a hip yoke, but is laid in inverted plaits at the back. To cut this costume for a girl eight years of age, 6⅛ yards of material 21 inches wide, 4½ yards 32 inches wide, or 3¾ yards 44 inches wide, will be required, with one yard 21 inches wide for chemisette and undersleeves, 4½ yards of insertion and ¼ yard of all-over lace for collar, to trim as illustrated. The pattern 3836 is cut in sizes for girls 6, 8, 10 and 12 years of age; price 10 cents.

The waist No. 3792 is made over a fitted lining which closes at the center front, but when washable stuffs are used the lining can be omitted. The chemisette is attached to the right side of the lining, and hooked on to the left, or when the waist is unlined, is stitched to the right side beneath the collar and hooked on to the left, otherwise there is little difference in the method of making. When lined the fronts and back are arranged upon the foundation before the shoulder and under-arm seams are closed, and the gathers are attached at the waist-line; when unlined the fullness at the waist is simply stayed, or tapes are inserted in a casing by means of which it can be drawn up. In either case the sailor collar finishes the low neck, the stock is attached to the chemisette. The sleeves are in bishop style, finished with pointed cuffs that lap over from the seam. To make this waist for a woman of medium size, 3¼ yards of material 21 inches wide, 2⅞ yards 27 inches wide, 2 yards 32 inches wide or 1½ yard 44 inches wide, will be required, with 1 yard 18 inches wide for the collar, shield stock collar.

3792 Shirt Waist,
32 to 42 in. bust

3837 Child's Long Waisted Petticoat,
2 to 10 years.

The pattern 3792 is cut in sizes for a 32, 34, 36, 38, 40 and 42-inch bust measure; price 10 cents.

The child's long-waisted petticoat is meant for wear with the long-waisted frocks now in vogue. The original is of nainsook with trimming of needlework, but linen cambric and long cloth are all used, and simple strong lace can be substituted as trimming when preferred. The body portion is fitted smoothly and accurately, the shaping being accomplished by means of shoulder and under-arm seams. The skirt is simply full, gathered at the upper edge, where it is seamed to the long body. To cut this petticoat for a child six years of age, 2½ yards of material 36 inches wide, with 3¾ yards of needlework for frill and 1⅞ yard of narrow ruffling will be required. The pattern 3837 is cut in sizes for children 2, 4, 6, 8 and 10 years of age; price 10 cents.

A MAN should choose for a wife only such a woman as he would choose for a friend, were she a man.—Joubert.

What She Looked For.

"Why do I look so sorrowful? As long as you've asked me, Mary, I'm just going to tell you. I look that way because I am sorry. Every time I see you lately I feel the same way, and it gives me the blues until I see somebody else or get to thinking of something different.

"Not very complimentary? No, it ain't; but you asked me, and I'm going to show you if I can just how things are. It ain't right for you to go around making everybody unhappy, and I don't think you'd do it if you realized. We've been good friends ever since we've known each other, and I hope you'll listen to what I say and not get out of patience with an old lady that speaks pretty plain sometimes, but means well by you.

"It's going on towards a year now since I began to notice a difference. What it was started you, I don't know, but the first time I noticed it you was talking dretful hard about one of your neighbors. I tried to put in a good word for her, but no, you wouldn't listen. You couldn't have it that there was anything good about her.

"Well, ever since then you have been getting worse and worse. Now, take this afternoon: You haven't said anything good about anybody, and if you had to admit that some of them might not be all bad, you admitted it grudgingly, as if it made you miserable. If you get hold of any bit of scandal, it seems to please you more than anything you could find. It is an awful bad thing for you. You ain't really happy, as you used to be, and you make everyone you see more or less unhappy, too.

"What is that? You don't tell anything but what's true? I don't s'pose you meant to, but you've told me lots of things that I know wa'n't so. You see, this habit you've got into is spoiling your sense of truth. You needn't look so offended. I don't go 'round telling folks you're a liar. If I'd got into the same habit you have, you might be worried, but I haven't talked like this to anyone but you.

"Did you ever have any trouble with your eyes and go to an optician to have 'em examined? For one thing, he has you look at some lines like the spokes of a wheel and tell which ones look blackest and which ones look faint. Maybe the up and down ones you can see plain and the crossways ones you can't hardly see at all. Well, there's some trouble with you. You've got so you see the mean, bad traits of human nature awful plain and black, but the good and loving ones you can't hardly make out at all. If I could fix it so you'd look at things just the other way, why, I'd feel prouder 'n 's though I was the best optician in Boston. It's different from what 'twould be if 'twas your eyes, though, because it's your own fault that you've got into this way, and it's only yourself that can get you out of it.

"We all find what we look for in this world. When you are riding along to the village you can hear the birds singing, and you can look at the pretty trees

and the blue sky and smell the sweet air; or you can make yourself miserable by listening to the buggy squeaking, and seeing the old tin cans and rubbish that's been dumped at the side of the road, and choking yourself over the dust the horse stirs up when he walks up the hills.

"Once, when I was a girl, there was a phrenologist come to town, and we all had our heads examined. I got more interested than any of the rest of the girls, and I bought a plaster head and some books and went to studying. When I was in the city, I would go to the Natural History Rooms and look at the skulls, and I wished I had one to study. Well, all that time, whenever I went out for a walk in the woods or pastures, I'd most always find some little animal's skull—a rabbit's or a woodchuck's, or, maybe, some bird's. I got quite a collection of them. You see it was what I was interested in at that time, and so, having it in my mind, I saw skulls everywhere. Probably I'd been over that same ground dozens of times before I was interested in skulls and hadn't seen one.

"It's the same way with you. For some reason you've got interested in the mean side of folks. You are on the lookout for bits of scandal and for all such unwholesome things. In order to find 'em, you've got to be thinking about such things, and have 'em always in your mind, or else you would not see 'em. You've been at it a year, and I declare my collection of skulls looks pretty small side of your collection of mean stories about folks. If I'd been more interested and looked harder, I might have found more, but you've been real industrious, I must say.

"There, there! Mary, I didn't mean to make you cry.

"What's that? You've a good mind never to open your mouth again? Fiddlesticks, child! That's no way to mend matters. Maybe, I've been a little hard on you, but I knew you didn't realize, and I wanted to make you see, if I could. Now, wipe your eyes—that's right—and put up your handkerchief, and we'll see what kind of glasses we can fix up for you.

"Let's see; what did I get interested in after the skulls? I guess 'twas birds that come next. Yes; I'm pretty sure it was birds. I'd see 'em and hear 'em everywhere I went, and I most forgot there was such a thing as phrenology. Now, Mary, don't you s'pose you could get interested in the nice things about folks? If you can't find 'em, why, just try doing some nice, kind, neighborly things yourself. I tell you, it's doing just the little bits of thoughtful things for folks that makes kind feelings and good neighbors.

"You've got some dretful pretty flowers in your garden this Summer, and if I was you I'd make up little bouquets and give 'em to the neighbors when you go to see 'em. And then I'd talk about the flowers, and be kind and sympathetic if folks tell you their troubles, and I'd make it a rule never to say a word about anybody unless 'twas something kind and pleasant.

"You'll find that people will appreciate your flowers, and they'll feel more cheerful when you go away than when you come, instead of feeling bluer. And the world will be a different place for you, too. You'll see kindness and loving feelings where you never thought of looking for 'em before, and you'll most forget there is such things as scandal and hateful actions in the world. You just try it for a while and see if I ain't right. I do believe I can see that you begin to look happier already.

"Got to go? Well, I didn't know 'twas so late. Just wait a minute; I've got something for you. I know how interested you are in old-fashioned things, and a week or so ago I come across this old foot-stove, and I've been keeping it for you.

"Oh, that's all right; I want you to have it, and I'm real glad if you like it. Come over again soon, and good-bye and good luck to you."

SUSAN BROWN ROBBINS.

MOTHERS.—Besure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Rural Recipes.

Rhubarb Jelly.—Cut off the leaves and ends from the stalks, and wipe with a clean, damp cloth. Use an earthen dish for cooking. Without removing the skins, cut the rhubarb into pieces 2½ inches long, and put over them 1½ cupful of sugar, a piece of lemon peel, and a pint of water, this proportion to two pounds of rhubarb. Cover and set in the oven on a shelf. Moisten a half-ounce of white gelatine in a quarter of a cupful of cold water. When the rhubarb is tender put the gelatine in a large bowl, on which an earthen colander is placed. Pour the rhubarb on this, but remove it very soon to a dish, in order to retain sufficient juice with it. Stir the hot liquid underneath, and when the gelatine is dissolved pour into teacups or molds dipped in cold water. Only about a quart of liquid from the compote is needed for the jelly, the rhubarb, in sufficient juice, being available as a dish by itself.

Graham Crackers.—One cupful of sifted graham flour, two-thirds of a cupful of white flour, two teaspoonfuls of sugar, a dust of salt, two even tablespoonfuls of cold butter rubbed through the flour and sugar. Mix with sufficient cold water to make a dough. Roll them, cut in small oblong and round shapes. Bake in a quick oven. They should be about as thick as gingersnaps. They are very nice.

Chocolate Taploca.—Soak three tablespoonfuls of tapioca in a cup of cold water for half an hour; add three pints of hot milk, one cupful of sugar, yolks of two eggs and three tablespoonfuls of grated chocolate. Cook in a double boiler until the tapioca is tender. Serve with a meringue made from the whites of two eggs and powdered sugar or whipped cream.

Ornaloo.—Peel a dozen white onions, cover with cold water and steep for an hour. Then boil until soft; mash them and add to an equal quantity of mashed white potatoes; add two or three well-beaten eggs, about a cup of milk; do not have the mixture too soft, and salt, pepper and nutmeg to taste. Whip the mixture until quite light; turn into a baking dish and bake in a quick oven half an hour. When half done, pour a little melted butter or gravy over the top.

Eggs with Asparagus.—Cut about two dozen stalks of asparagus, leaving out the hard parts, into inch lengths, and boil tender. Drain, pour upon them a cupful of drawn butter, stir until hot, then turn into a baking dish. Break six eggs upon top and put a bit of butter upon each one, also salt and pepper, and place in a quick oven until the eggs are set.

Fresh Strawberry Pie.—Bake an empty bottom crust, making it extra nice; prick holes all over the bottom and sides, to prevent its getting out of shape. As soon as baked sprinkle the inside with sugar and fill with ripe berries; also well dredge with sugar. Cover with sweetened whipped cream and then cover all with a meringue of the frothed whites of two eggs mixed with two tablespoonfuls of sugar and a dash of lemon juice. Invert a plate in the oven and place the pie plate on top of it and brown. If the work is very carefully done the berries will not be even heated, and the result will be delicious. The pie should be thoroughly chilled before serving.

Gingerade.—Dissolve three pounds of loaf sugar in two gallons of water, add beaten whites of three eggs and two ounces ground Jamaica ginger moistened with a little water; bring slowly to the boiling point, skim and settle. When cold add juice of a large lemon and one-fourth yeast cake dissolved in two tablespoonfuls warm water. Mix, strain, bottle, tie the corks down, and in two days it is ready to use.

Too Many Cooks.

The Youth's Companion tells of a bright Englishwoman traveling recently in America, who showed herself so appreciative of all good things American that she was met everywhere with the utmost eagerness to afford such information and explanation as she desired. At home she was the owner of a beautiful estate where she entertained largely and it occurred to her that she might offer an agreeable variety to her English guests and a welcome reminiscence of home to American friends if she could carry back to her cook some recipes for dishes distinctively American. She broached the idea while lunching with three of her new Yankee acquaintances. They were most responsive.

"Beans!" cried the lady from Boston, instantly. "My dear, beans!"

"But we have beans in England," remarked the Englishwoman. "And I really shouldn't imagine they afforded much opportunity for—"

"Fine cookery? But they do, I assure you. Boston baked beans are quite different from any other beans. Our beans—"

"Chowder!" interrupted explosively the lady from Rhode Island, smitten with a sudden happy thought. "Beans are nothing to it. Clam chowder! There's no dish so purely and deliciously American as a good clam chowder—none. It originated—"

"Maybe it did, and maybe it didn't," broke in the Maine lady, unexpectedly. "It's a disputed question; but succotash is *sure*. Succotash is Indian beyond a doubt—real, native, aboriginal Indian. It's the one Indian dish. The Indians—"

"No more than hominy and chowder. Chowder is Indian, too. First you want your clams—good, fresh ones—"

"I don't admit that Indian dishes are as typically American as some others. We're not Indians, and our ancestors weren't. Now, with baked beans it's different. The distinction is—"

And just there the cooks began to stir the broth and mix it. "Perfectly fresh ones, you know, and milk and corn and onions and potatoes and pilot-crackers. Some people don't put in corn, but I think"—"taught the settlers. It's corn and beans together, and really most appetizing when"—"baked for hours and hours as slowly as possible; and they come out the loveliest brown, and so tender and rich"—"fire of driftwood and smother it under with seaweed and roast the ears in the ashes to eat with it"—"every Sunday morning all over New England since nobody knows when"—"the most characteristic kind of a Yankee good time. Till you've been to a Rhode Island clambake you actually can't imagine"—"why, when it's so simple, most people don't mix their beans and corn in the right proportion. I don't know; but they don't, although everything depends"—"sure you'd be delighted"—"say it was simply delicious"—"never tasted such a tempting mouthful in your life"—"just a sniff is enough to make you hungry as a hunter"—"there's nothing else in the world one wants to eat so much of—it's almost shocking!"

The English lady recorded in her note book:

"Succotash: A popular American dish invented by the Indians; a kind of fish stew, prepared with maize, beans, seaweed and the variety of mussel called clam. It is simmered over night in the oven in a deep earthen pot, and is customarily served on Sundays throughout the States."

With the Procession.

FREELY Thou givest, and Thy word
Is "freely give."
He only who forgets to hoard
Has learned to live.
—Keble.

A WOMAN'S lot is made for her by the love she accepts.—George Eliot.

A WOMAN'S hopes are woven as sunbeams; a shadow annihilates them.—George Eliot.

IF WOMAN did turn man out of Paradise, she has done her best ever since to make it up to him.—Sheldon.

THAT is true philanthropy that buries not its gold in ostentatious charity, but builds its hospital in the human heart.—Harley.

THE most commonplace person has wild regions—wildernesses it may be—of thought and feeling, which even his most intimate friends hardly ever enter.—Arthur Helps.

THE only faith that wears well and holds its color in all weathers is that which is woven of conviction and set with the sharp mordant of experience.—James Russell Lowell.

How mankind defers from day to day the best it can do and the most beautiful things it can enjoy, without thinking that every day may be the last one and that lost time is lost eternity.—Max Muller.

EACH man has to seek out his own special aptitude for a higher life in the midst of the humble and inevitable reality of daily existence. Than this there can be no abler aim in life.—Maeterlinck.

HE only is advancing in life whose heart is getting softer, whose blood is warmer, whose brain quicker, whose spirit is entering into living peace. And the men who have this life in them are the only lords and kings of the earth—they, and they only!—Ruskin.

IS THERE any Pure White Lead nowadays? Yes, and it is made in the old-fashioned way by the "*old Dutch process*" of slow corrosion.

The brands named in margin are genuine, and, with pure Linseed Oil, they make the only durable and satisfactory paint.

For any color or shade required, use NATIONAL LEAD COMPANY'S Pure White Lead Tinting Colors. Pamphlet sent free upon application.

National Lead Co., 100 William Street, New York.

MARKETS

The Week's Quotations.

WHOLESALE PRICES.

NEW YORK, JUNE 22, 1901.

GRAIN.—Wheat is lower and export trade and speculation dull. Corn has advanced on heavy Chicago trading. Business in oats in quite heavy, both for home and export trade.

BUSINESS BITS.

THE shock compressor offered by J. B. Hughes, Greensburg, Ind., is a neat little device that will be found convenient and valuable to a great many. Write for price list—a sample costs only 45 cents.

THE 1901 illustrated catalogue of the E. W. Ross Co., Springfield, O., will be sent free to any reader asking for it. The implements made by this company have been on the market for more than 50 years, giving entire satisfaction to farmers in every part of the country. The Ross silage and fodder cutters are now made with blower attachment. The blower has been tested for three years, and the Ross Co. guarantee it to work satisfactory in every way.

FLY time has no terrors for farmers who have a supply of So-Bos-So Kilfly on hand. It is hard to imagine any investment that will yield so large a return as the money spent to prevent flies from tormenting milch cows. The expense is slight. Write to Chas. H. Childs & Co., 12 La Fayette St., Utica, N. Y., for prices and particulars.

WHERE it is possible to do so, there is certainly a great saving in buying direct from the manufacturer. A number of carriage manufacturers who formerly sold to dealers have now adopted the plan of selling direct. One of these is the Columbus Carriage and Harness Co., Columbus, O. The same grade of wagon sold by dealers can be had at a saving of from 10 to 25 per cent. Send for illustrated catalogue.

Interesting Canadian Notes.

I have been thinking our weather here rather trying. I have nearly an acre sown with onion seed. It has come up very well, but for about three weeks the plants have remained at a standstill, corn the same, that is, that came up. I have one piece of corn on lighter, warmer land that came up well, and with the weather of the few last days will now push ahead finely. Potatoes look well; also sugar beets. I am in doubt as to what I ought to do with the asparagus. The rust of the two past years has damaged it badly. Some of it I have had plowed up already. Shall I plow up the rest is my problem. Pears and plums promised to be a large crop. The trees were white with bloom. Wet weather and one night of frost have broken the promise; the crop will be fair only, and so perhaps more profitable. I am trying four new varieties of potatoes from Michigan—Early Pink-eye, Early Pingree, Early Snowball and King of Michigan, all highly recommended, of course.

After buying Aster seed, sowing it in the house and transplanting into a hot bed I discovered hundreds of plants ever so much finer growing in the bed where I had Asters last year. I have been able to supply over a dozen of my neighbors and friends with just as many as they would take. In this vicinity Winter apples will not be a good crop; but early and Fall apples will be, at least, if I may form an opinion from my few trees. Cherries promise well. I have a half-acre strawberry patch. The Winter, though milder than usual, was severe on it. The plants were not as well covered as they ought to have been. I will look after them next time myself. Mild as was the Winter, I hear of more complaint than usual of its hurtful effect on clover, on shrubs, and on the trees. A third of my colonies of bees died through the Winter, and yet with all the cold wet weather I have had as large or larger proportion of early swarms as usual. I do not understand why! I wonder whether one can become immune to the stings of bees by their frequent repetition. I mind a sting very little. I have seen some suffer more from the bite of a mosquito than I do from the sting of a bee. This year and last I supplied myself with flowering plants for my garden, such as carnations, geraniums, Verbenas, Fuchias, Salvias, Petunias, Coleus, Alternantheras, heliotropes, etc., by buying "rooted cuttings." These can be had for about $1.50 per 100, some a little more, some as low as 70 cents, Verbenas for instance. By putting these in a hot-bed they soon grow to fine plants. On May 26 I went to a place on the south shore of Georgian Bay, and was surprised to find the trees and garden stuff as far ahead as they were at home, though, I think, this cannot be usual. The soil there is sandy and the rock not much below the surface.

IMPRESSED UPON HIS NOTICE

The various features for which the Lackawanna Railroad has become noted are involuntarily impressed upon the notice of the passenger, who realizes the luxury of hotel or club appointment in the electric lights; the smooth running journals of the wheels; the extraordinary cleanliness made possible by the use of anthracite coal, avoiding all dust and nauseating smoke; the consciousness of being always on time—which comforts force an ease of mind and body most favorable to the enjoyment of the unsurpassed scenery through which the lines pass. It is but the natural sequence that the Lackawanna is prosperous in like degree to its excellence of service, and its warm friends are equal in number to its whole list of patrons, for once to test its service means an ardent admirer and friend earned for the road.—Van Etten Breese.—*Adv.*

The New Horticulture

BY H. M. STRINGFELLOW.

We do not hesitate to say that this is one of the most interesting books on horticulture that ever was printed. Most reading farmers have heard of the now famous "Stringfellow Method" of planting trees, but few understand clearly what it is. This book tells the whole story in clear-cut, forcible style, which all can understand. Not only is the theory of close root-pruning carefully explained, but the general principles of gardening and fruit-growing are discussed. Mr. Stringfellow is a practical gardener, and he gives his own experience. We commend the book to all without reserve. New Edition, paper covers, 50 cents.

THE RURAL NEW-YORKER, New York.

Market Briefs

PICKED UP HERE AND THERE

ODD FRUIT NOTES.—Peaches are arriving in car-lots from Georgia, but the quality is inferior. Some of them which look really fine taste but little better than pumpkin or raw potato. Probably the trouble is that the fruit is picked too green. A good many eastern cherries are seen, but largely of poor quality. California plums are on hand in large quantities. As usual they are put up in good shape, but are disappointing when one tries to eat them. A little later in the season they will be better. Watermelons are coming by the carload. The quality is good, but price too high for general consumption. The better grades of muskmelons are scarce. There are plenty of strawberries, but prime lots are the exception. We see a great many that are small, sandy and more or less crushed in transit. A few Maryland red raspberries have been received and peddled out at 10 to 12 cents a pint. Large blue huckleberries are selling well, and the same is true of prime blackberries.

UNSATISFACTORY SALES.—A correspondent sends us a memorandum of the returns received by him for a shipment of maple sugar and syrup sold by a New York general commission merchant, and feels that the low price secured practically amounts to robbery. The figures given do seem rather low, but the market for maple products of late has been very dull, and it is possible that this concern got as much for the shipment as anyone could. We have bought excellent maple sugar here (as nearly pure as any that is to be had) at 10 cents a pound retail. This commission firm, of which our correspondent complains, has a good name, and is to all appearances doing a square business; but they are more in the line of fruits and vegetables, potatoes being their specialty, and such products as maple sugar are merely a side issue. We think that as a rule it pays better to ship uncommon products of this sort to dealers who make a specialty of them. There are those who handle nothing but honey, maple sugar and syrup; and others have a large trade in these goods in addition to other products. The chances are that either of these classes would handle a shipment of maple sugar to better advantage than those who perhaps do not receive more than one or two consignments of it during a season. Unless some chance buyer comes along, they have to go out and hunt up a dealer who will take it off their hands, probably at a discount. There is a great difference in men in this particular. We have seen commission dealers who, in an effort to sell some shipment they had received, and for which there was no call, would chase around the streets and spend in time more than the value of their commission trying to make a satisfactory sale. Others make no special effort in such cases, letting the stuff stand around in their stores until it spoils or is sold for a trifle. In either case the shipper growls at the returns, and the man who takes some trouble to make a sale feels that he gets small thanks. The dissatisfaction of shippers over prices received is a common complaint. There is good ground for it in many cases where receivers, through shiftless methods of handling, allow stuff to spoil, and then write the shipper that it was in that condition when received. The reputation of the better dealers suffers from the methods of these snides, whose chief qualities are laziness and dishonesty. Judging from what shippers have told us, we believe that when one finds a commission merchant who knows his business and is careful and honest, it is a good plan to stick to him. There are plenty of this class without patronizing the frothy concerns whose chief capital consists of flaming letter heads and great promises, which they never carry out. W. W. H.

FRUIT IN THE LOWER HUDSON VALLEY.

A Trip Among Growers.

PART II.

Last week I ended up a 200-mile drive through Orange, Sullivan and Ulster counties, N. Y., in a two-days' trip in the Hudson River section from southern Ulster to Cornwall. Starting from New Paltz in Ulster County one plunges right into the fruit orchards at the threshold of the village. Through this whole section peaches are light. There are some exceptions in individual trees, but the general conditions are light foliage, with considerable blight and light setting of fruit. C. M. Harcourt had some trees pretty well set. His peaches were good and plums heavily loaded. His ground showed thorough cultivation. Elting T. Deyo owns the adjoining place, and while apparently not cultivating a large acreage his plantings look well. A young peach orchard of great promise, we were told, belongs to J. M. Hasbrouck. The trees seemed to be about three years from planting. They are heavily loaded and look as if there was not likely to be any more drop. Mr. Hasbrouck is also a large grape grower. His currants are heavily loaded, but are shelling some, and show signs of early color, probably due to the fact that the plow had turned the earth away from the canes and left them somewhat exposed. This mistake is pretty sure to hurt the crop. This place also has a young orchard of apples which promise a nice crop. Nathan Elting runs largely to grapes and pears, but grows some peaches also. The Kieffer seems to do well here as elsewhere. H. E. Brown, who enjoys the reputation among some of his neighbors of being the best fruit man in his section, has about 100 trees that reports say never net him less than $1 a tree, and sometimes run close to $1.50. About the only fruit that seems at all neglected in this section is the grape. This is not universally true, but poor tillage and neglect are frequent enough to cause comment, where other fields are so well tilled. The condition was explained by one man on the ground that the grape crop had not been a remunerative one of late.

Right in the heart of this great fruit district one meets good farms devoted to dairying. Nathan Rose owns one of these, sending his milk to the creamery at New Paltz on the Exchange basis, which is now 1¾ cents per quart to him. A threatening cloud hurried us past Jacob La Fevre's place, which looks inviting but which is not largely devoted to fruit. The storm drove us to shelter in the barn of Philip H. Dubois, who with his son Henry is operating a large dairy farm, making from eight to 16 cans of milk a day. This goes to the Borden condensery at Wallkill at 1½ cent. The distance is 14 miles. His place contains a large planting of young apple trees. His criticism of farming conditions in that section is that farmers do not keep stock enough. They take all off the farm and put nothing back to keep up fertility. Henry is manifesting some pardonable pride in a five-year-old Hambletonian mare which he has recently purchased. Close to Clintondale we passed a large fruit farm owned by Henry J. Dubois, and quite a large planting of young grapes by Geo. Hull. The finest field of Delawares that we saw in this section belong to Hurd Brothers just west of Clintondale. They also had the best-looking field of Mariboro raspberries we had seen up to this point, but farther on we saw a fine field on Henry Roe's ground and one or two others farther along towards the river, but raspberries are generally light and unpromising.

One of the finest cultivated fruit farms that we saw is that one owned by C. A. Jenkins and his son, Irwin Jenkins, on towards Highland. I believe they are two separate farms, though joining each other. Mr. Jenkins put us on the right road to Milton, and we tarried long enough to learn something of his fruit industry. He has nearly 4,000 grapevines and 250 Japan plums. He likes Burbank best. His currants are promising, no drop to speak of. His Bartletts have dropped badly, and he does not expect one bushel where he had 100 last year. Thrips and borers seem to be his greatest annoyance. He has some notion of spraying a weak solution of tar on the under side of grape leaves for the annoyance of thrips. We encouraged the experiment, and would be glad to learn later what effect it will have on this restless little pest. All through our ride of over 200 miles up to this point we found blackberries heavily loaded with blossoms and strong vigorous canes. In the vicinity of Milton and Mariboro, however, the canes had winterkilled badly, and this section will be an exception apparently to the generally favorable conditions at this time. Complaint of a short strawberry crop is also general in this section. The fields show lack of foliage, some rust, and for the most part light setting of fruit, and fully a week or 10 days or more late. Wm. Belt seems the favorite with quite a large planting of Gibson. In this section currants are quite badly affected with a scald or leaf blight, which in some places has also attacked the fruit. J. A. Hepworth, of Marlboro, has the worst affected piece we saw. He has a large planting of Fillers. They are well set, and before the blight struck them the promise for a large crop must have been most encouraging. They seem to be less affected on the low ground and where shaded than on the high portions of the field. It is difficult to find a satisfactory reason for this condition. It may possibly be due to the intensive cropping in this section. Mr. Hepworth has great encouragement, however, in his prospect for peaches. He has a large acreage of well-tilled, well-cared-for trees, and the promise for a large crop is all that could be desired.

After all these observations we did not feel entirely satisfied without a look in on John R. Cornell, of Newburg. We knew that if any man could grow currants and pears he could, and so he has. Except for an occasional tree here and there he has the only crop of Seckel pears we saw on the whole trip. His trees will need to be thinned, and the heavy, rich foliage promises to carry the fruit through to maturity. The trees show effect of liberal fertility, thorough culture and plenty of spraying. He sprayed with arsenate of lead, one pound to 50 gallons of water, and four to five gallons to the tree. "I was there myself, and the spray went on until I said enough," was the way he put it. The arsenate of lead is favored because "it sticks like lead through all the rain." Ground bone, potash, spray material and cultivation seem to be the elements in Mr. Cornell's genius for pear growing. His Bartletts are set lighter than Seckels, but most trees have all the fruit they ought to carry. He has some Bosc top-worked on old Lawrence which are well set. Two points that he makes for Bosc are that it sets fruit all over the tree, and that the long stems swing in the wind and the fruit does not drop. His currants are almost as promising as the pears. One piece has rusted a little, but not seriously. The aphis is bothering some, but as a whole his bushes are looking well, with good healthy foliage and heavy setting of fruit. He was inclined to think lightly of his strawberry crop, but after visiting other places we thought he had a good crop, though like others late.

From here we returned to the point of starting, the Orange County Nurseries at Cornwall, Mr. Dwyer having accompanied me on the entire trip. He seems to have the art of growing strawberries as completely conquered as Mr. Cornell has pears. The week had done wonders for his vines. The plants and foliage had developed, and the promise of fruit was such as we saw nowhere else. Sharpless, Lovett's Early, and especially Glen Mary yet showed signs of the blight referred to last week, and light foliage, but they were bearing a nice lot of fruit. The Bubach had kept on developing, and was by all odds the best seen on the road. The set of berries was in keeping with the foliage. Gandy, Wm. Belt, Marshall and Parker Earl had all developed a rich foliage, strong stem and heavy setting of fruit. The older planting of Gibson was light here as elsewhere, but a young bed looked strong and had a good setting of fruit. This is a berry of fine quality, and it is hoped that it will prove a more vigorous grower than this wet season seems to indicate. The Rough Rider seen here is a vigorous grower; the fruit is medium in size, rather irregular in form and of low quality. Among other varieties doing well was the Nic Ohmer. It was growing in a young bed, vigorous plants, rich foliage and good setting of large shapely berries of high flavor. The Marshall continues to do well on these grounds. I put a tape on one berry picked from a young bed that measured 9½ inches around. Of course, this was exceptional, but shows the vigor of the plant, and gives some intimation of its prolific qualities.

To sum up the whole fruit situation in the Hudson River Valley, and omitting the exceptions, cherries are almost an entire failure; apples and pears will be very light; strawberries generally light and late; peaches promise an abundant crop; currants from present indications good; raspberries for the most part light, and blackberries unusually promising. Plums abundant. J. J. D.

JAMES WRIGHT, of the produce commission house of Jelliffe, Wright & Co., of this city, died suddenly while on his way home from business June 18. Mr. Wright was 62 years old and had been with this firm for 30 years. He was born in northern New York and spent part of his early life as a school teacher and clerk in a store. At the time of his death he was serving his second term as member of the Board of Education of Brooklyn. He was connected with the order of Good Templars, and was active in church work.

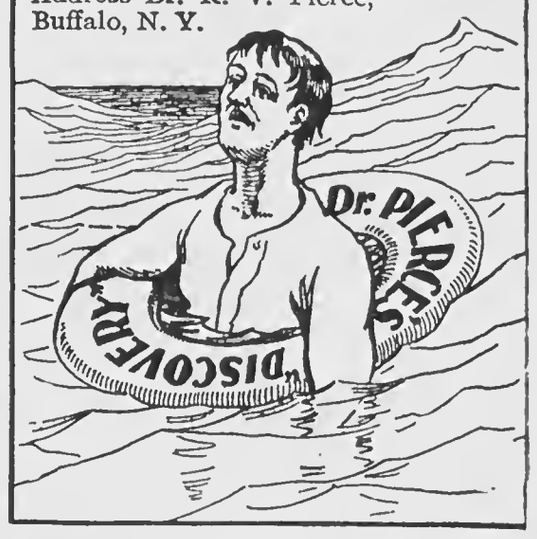
THERE'S SAFETY FOR THE SHIPWRECKED IN HEALTH

Who trust to Dr. Pierce's Golden Medical Discovery. It cures ninety-eight per cent. of all who use it. Old forms of disease, obstinate cough, weak lungs, spitting of blood, weakness and emaciation are perfectly and permanently cured by this powerful remedy.

"My wife had hemorrhage of the lungs," writes W. A. Sanders, Esq., of Hern, Mason Co., W. Va. "She had ten hemorrhages, and the people all around here said she would never be well again. But she began to take Dr. Pierce's Golden Medical Discovery and she soon began to gain strength and flesh. After taking ten bottles she was *entirely* well. If any one doubts this, they may enclose self-addressed envelope with stamp, and I will answer."

Sick persons are invited to consult Dr. Pierce by letter *free of charge*. All correspondence strictly private. Address Dr. R. V. Pierce, Buffalo, N. Y.



HALE'S ORCHARD TOOLS | Clark's Hay Tools, D. A. Harrow moves 15,000 tons earth in a day. These 5 tools cut a track 31 feet wide. IMPROVED SICKLE WATER GRINDER | 16-in. Sulky Plow; draft 300 lbs. All made by the Cutaway Harrow Company, of Higganum, Conn. Send for Circular.

NEW CENTURY FLY KILLER OIL

Harmless to man & beast, and will not taint milk.

This cow was not protected with FLY KILLER OIL. Had she been, she would not have lost milk and flesh amounting to $14. The other cow was protected earlier and continued to give 18 qts. daily through fly time. Thousands of farmers testify to its merits. Send $1 for a Sprayer and enough Oil to protect 150 cows. Ag'ts Wanted. D. B. Smith & Co., Utica, N. Y.

VETERINARY PIXINE

Marvelously Effective. Absolutely Sure.

Unlike all others it is scientific—the purest, most potent, penetrating healing remedy in the materia medica. Speedily cures Scratches, Speed Cracks, Grease Heel, Old Sores, Hopple Chafes, Hoof Rot, Mange and Skin Disease.

Money back if it fails.

2 ozs., 25c. | 8 ozs., 50c. | 5 lbs., $4.00 } At all Druggists and Dealers, or sent prepaid.

Live Stock and Dairy

SILAGE FOR HORSES.

Inquiry is made in a recent issue regarding the value of silage as food for horses. As with other kinds of stock, much will depend on the quality of the silage, but there seems no reason why good corn, well preserved, should not be as valuable for the equine as the bovine tribe. In this locality, in the first experiments with silos, the mistake was made of planting vigorous growing varieties of corn, such as Mammoth Cuban, Red Cob, Ensilage, etc., the aim being to raise as great a bulk of feed as possible. Owing to the proximity to Lake Ontario, the crop usually failed to mature sufficiently before harvesting became necessary to escape the early frosts, which sometimes occur here by the middle of September. Silos filled with this unripe stuff could not turn out a good, sweet, nutritious food. Now, some of the early maturing flint corns have become popular, the desire being to obtain a good yield of grain, less stress than formerly being laid on the amount of stalk secured. On silage of this kind, cut when the grain was getting hard, we have wintered four horses, feeding it steadily until June 5. It is mixed in the proportion of two parts silage to three of cut oats or wheat straw. No water is put on it, as with cut straw or hay. During the Winter, when work was slack, some chopped oats were added, the quantity being increased when heavy work began in the Spring, to a gallon each. I am emphatically of the opinion that it is the cheapest, wholesomest and best feed we can get here, being much superior to the best hay fed with a similar quantity of oats. The horses have never looked so well. One would suppose they would be soft when put to steady work. On the contrary, their power of endurance has increased. Even when commencing hard work there was less sweating than usual, and their flesh is firm and coats clean and glossy. One animal that was sometimes troubled with colic if not carefully fed, has shown no sign of it since going on the new diet. The only injurious effect I have been able to discover is that they are doing their best to kick the stable to pieces during their hours of rest.

It is sometimes argued that all animals being fed on cut feed should be fed at intervals with uncut straw or hay, presumably as an aid to digestion by promoting a flow of saliva, possibly that they may in a measure earn their "vittles." Our cattle have been enjoying practically the same kind of feed as our horses since last November, and although not one of them has sampled a forkful of uncut hay or straw, they are all looking better than ever before. The silo has come to stay, and I am satisfied that in Ontario, once noted for its barley and wheat, it will be found that corn is king, but differing in this respect from some of the corn-growing States of the Union, that instead of our corn being shipped abroad, it will be fed at home, the fertility of our farms maintained, and the quality of our finished products made better than the best. B. C. W.

Oakville, Ont.

CARE AND SALE OF MILK.

About 30 years ago very little attention was given in this section either to the production or manufacture of milk into butter and cheese. Precautions to keep the milk free from odors in the barn and house, I might say, were not known or considered. About this time came the patron factory, for making cheese; then followed the addition for making butter and cheese, and this continued, till after the railways were called upon to help supply New York with whole milk. This outlet steadily increased, and pushed out farther from year to year, till our whole territory here is mostly given up to this mode of disposing of our milk. In the meantime, our State institute and its scientific instructors, holding meetings in all parts of the State, began to enlighten the producers and farmers, and instruct them in better methods. The agricultural papers have also done much in this line through their columns, so that, as the farmers began to read and hear, they began to act and organize through the Grange for mutual improvement, until all the questions relating to the sanitary conditions and modes of taking better care of their product are well considered. I need not say that a rapid progress has been made in all the details of milk production and handling. To keep the milk cool and sweet, we use ice mostly; some have cold running water from a spring, or a cold spring covered by a small building. The aerator is also used; any of these means to remove as quickly as possible the animal heat. Milk coolers are not so much in use now, the 40-quart can taking their place.

As to the Milk Producers' Association, its work has been along the line of marketing and combining interests, so as to be able to continue business, as the Milk Exchange had forced down arbitrarily the price below the actual cost of producing. A few words as to the milk when it leaves the farms. Great care and neatness are observed in milking the cows; good ventilation, barn free from odors and the milk as soon as drawn from the cow is taken outside the barn to empty into the can for cooling. When properly cooled, it is taken to the shipping station, and I say right here that very little milk as it leaves the farm, but what will exceed by quite a little the per cent butter fat required by law. It is pure and wholesome, and if the city fails to receive such quality of milk, it must be the fault of unscrupulous dealers. I should have added that it is these dealers that the F. S. M. P. A. is organized against, trusting in the near future to sell and deliver to the consumer pure and wholesome milk, as it comes from the farm, and at less price, and at the same time receive for the producers a fair price. We are now receiving in this section about 60 cents per 100, and you pay the dealer about eight cents per quart. Such a wide difference speaks for itself, allowing you receive as good quality as we ship. W. F. J.

Earlville, N. Y.

Angora Goats.

Thanks are due THE R. N.-Y. for the conservative view it took of the Angora goat question, when so many writers were sounding praises of this animal so loudly, and even the Agricultural Department at Washington seemed willing to circulate statements too full of praise to be easily credible. Our own little experience leads us to advise caution. Evidently a very large band of goats in a small pasture will clear out the brush, but what will prevent the goats from losing flesh in the time it takes to accomplish this? Then in climates where Winters are long it will put a big hollow in the grain pen to bring them into condition again. Something to clear pastures from brush, that would raise a profit to the farmer at the same time, is very pleasant to read about, but for those whose eyes begin to be opened by experience it is too much to expect in the cold Northern climates. The fine-sounding declaration that the long staple fleece that shows the Angoras up so beautifully, will bring much more money that wool, loses a lot of its alluring charm when a whole fleece from the average flock will only sell for 60 to 90 cents, while that from ordinary sheep would bring from $1 to $1.65. The man who looks on to behold his neighbor buy the experience in goats, is adhering to good business principles, and if he builds his fences good and tight when the land is too full of water to cultivate, and keeps a little flock of sheep, he will surely make a profit, while the chances are more than even that there will be a loss to the larger half of those going through the experimental stage with Angoras. To keep sheep and improve the flock, and look into the goat industry after a few years have passed, seems now good judgment for the New England farmer. There is always a lot of volunteers in any new enterprise, and there will be those in this section who will take an early venture in the Angora goat business. J. H. R.

Portland, Me.

Vaseline for Cows.

We find vaseline is a valuable adjunct in the cow barn. Sores on the teat or udder, caused by bruises, barbed wire, etc., are quickly healed. Sometimes, when cows are first let out to pasture, a hot, sunny day will sunburn many of the udders, provided they are large enough, so that the cow's tail and legs can't hide them. The cow will be uneasy, and walking with distended udder chafes her. Now is the time to rub in a little vaseline and a trifle on the teats before milking—not enough to make things greasy. You will have less to try your patience, the cow will give more milk, because she is more comfortable. Vaseline is a trade-mark name. Petroleum jelly is the same material, and can be bought much cheaper and in bulk at any drug store. H. G. M.

Fly Killers on Cattle.

The best preventive that I have used to this time is a mixture of fish oil and carbolic acid. For a quart of oil a tea or dessertspoonful acid to the oil. Apply with a sponge after milking. JAMES R. ORR.

Ohio.

Shoo Fly comes the nearest to filling the bill of anything I have found, but it should be put on after milking, or say 30 minutes before milking, followed by ventilation of stables. C. L. PECK.

Pennsylvania.

The best remedy we have tried is the Shoo Fly. As long as we can keep it fresh we have no trouble with flies or other insects. For the past few years we have been troubled very little with flies or gnats in this climate, which makes a very desirable place for cattle.

Arkansas. JAMES T. HENDERSON.

I find the oil effective as a means of keeping flies from the cattle, particularly milch cows; much better than the grease formerly used. The oil is used with a sprayer that is made for the purpose. There seems to be no danger of any odor penetrating the milk, while the heat of the milk is passing off. H. F. P.

Brewster, N. Y.

Any preparation that will stick affects the pores of the skin, and I know of damage from their use. Those that are of a volatile nature are the safest and best, but are useful only as applied at each milking. We have used kerosene, and theoretically it will kill every fly it touches, but many of them are driven away by the application, and come again as soon as the odor has gone. If there is one spot untouched by any preparation they find it at once, and stay there. I am inclined to think crude petroleum or kerosene about as good as anything. I might add that among our patrons those who feed liberally during the shortage of pasture grass are those who complain least about the flies. I have not seen any effect in the milk when these preparations have been used before milking. H. E. COOK.

New York.

Tuttle's Elixir

Cures all species of *lameness, curbs, splints, contracted cord, thrush, etc.* in horses. Equally good for internal use in *colic, distemper, founder, pneumonia, etc.* Satisfaction guaranteed or money refunded. *Used and endorsed by Adams Express Company.*

TUTTLE'S FAMILY ELIXIR Cures rheumatism, sprains, bruises, etc. Kills pain instantly. Our 100-page book, "Veterinary Experience" FREE.

THE CHAIN-HANGING
Cattle Stanchion
The most practical and humane Fastener ever invented. Gives perfect freedom of the head. Illustrated Circular and Price free on application. Manufactured by O. H. ROBERTSON, Forestville, Conn.

DAIRY AND FARM NOTES.

Reform the Robber Cow.

I have a two-year-old heifer giving 26 pounds of milk per day. She is not built on "dairy lines." Will she be likely to improve and make a profitable cow, or should I beef her? C.

RESPECT FOR COWS.—Every day and year in dairy experience adds to my respect and consideration for a cow. I read and hear about the unprofitable or "robber cow," and there are thousands of them. But the one thing that taxes my patience and excites my sympathy is this constant howl about poor cows, when these same poor cows so often do not have any chance to show the stuff that's in them. I have had the courage, against strong odds, to say from the institute platform that we are more in need, as a whole, of food and care than breed. In other words, the opportunity is far greater, the chances for failure further removed, less danger of drawing a blank, and less money expended, in developing what we have than in paying extravagant prices for purebred animals, some of them being valuable chiefly for the length of their pedigree. I do not wish to ignore the value of pedigreed stock, or improvement in stock by selection and breeding. Without this constant selection, we should soon revert to the original stock.

MAN AND NATURE.—Did you ever observe, as written in geological history, that nature was slowly but surely evolving a higher development of animal and plant life during prehistoric ages. When a man assumed command and began a development of animal life, a marvelous change took place, and now if man withholds his energy, reversion rapidly takes place toward the original type. Let us, therefore, look carefully to our breeding stock, but remember that food and care, with selection, have built up our great producers. Six of Blackwell's 10 rules for stock improvement pertained to food and care. Cow education has therefore come to be as much of science as pedagogy. This long preface has been written that I may not be misunderstood. Animal life and the laws that govern it are complex; they are not easily changed, or rather, results are not momentarily changed. This robber cow in the hands of Smith may become a profitable cow when Jones gets a chance to educate and develop the animal.

BEGIN WITH CALF.—This development must begin with calfhood for best results, and right here I wish to make a general observation that I feel confident those who have the same opportunity to observe will readily accept. Communities of dairy farmers who have produced butter year after year, without regard to its value in comparison to cheese or crude milk, carefully fed their skim-milk to their young, growing stock, have prospered very favorably in comparison with sellers of milk or manufacturers of cheese, although the last named as a rule receive considerably more for their milk than the butter producers. The feeding of milk to the young calf during its first year, the only natural food, develops digestive powers never lost during after years of hard work at the pail. While at the time of reckoning the milk seller gets larger returns in the end if he raises his stock they must suffer in development and power of digestion, or, as found in most cases, the dairymen do not raise them at all, but depend upon the dealer to bring in a fresh supply and take away the worn-out animals for beef or bologna, depending upon their condition.

TRAINED ROBBERS.—Among the farmers in the milk-selling sections are numberless "robber" cows. They buy them of farmers who have not been good feeders, and put them upon heavy feed at once. Their milking machinery is about as well adapted to utilizing this raw material, and converting it into milk as would be the Erie Canal for a man-of-war. If these cows had received an early training, made up of well-balanced rations, suited to their individual needs, not necessarily compounded in accordance with some chemist's theory of foods, given rational care, not sentimental care, the food fed later in life would have returned a profit. My friend, Gould, says some sensible things along this line in the issue of Hoard's Dairyman for June 7.

FAT HEIFERS.—Would you put a heifer two years old in the robber class, giving 26 pounds of rich milk a day? Of course, this is quite indefinite. C. does not give the per cent of fat nor cost of keep, two essentials. But I should consider this animal far removed from the robber class, unless she has a tapeworm, and consequently, eats everything in sight. If this heifer is giving four-per-cent milk, she is making 8½ pounds of butter a week, or producing enough fat to make it, if carefully manipulated. How much milk she will give in a six-year-old form no one could tell. I have been greatly interested of late in studying the difference in families. We have a family of Holsteins that gave nearly as much milk in their three and four-year-old form as later in life. Another family that came on later was so inferior to the first mentioned that we disposed of the bull that sired them, feeling we had made a serious blunder. At five and six years old these cows came to their maturity, as the first ones did at three and four, and were deep, heavy milkers. I would not care to go on record as saying a heifer at two years old of inferior dairy form and ability would develop into a profitable cow at six. The good cows have their sign out with their first calf, not necessarily at 20 months to two years old. I am of the opinion that many otherwise strong, healthy cows have been permanently hurt by early calving.

EARLY CALVING.—It is the most veritable humbug that a heifer must calve before maturity, or she will develop into a beefy steer. Ten years of persistent milking is a long, hard strain, coupled with an annual reproduction, and no better preparation can be given than to have the heifer strong, well ripened, and fat, if necessary. If her breeding has been from dairy animals and her food adapted and liberal, the beef will come off, the thick neck will come down, and this heifer will have a start, "a constitution like an ox." The first mentioned family of Holsteins were of this type, calving at 2½ to three years old, and usually fat. We soon pumped that out into the milk pail, and fed cornmeal to get it back again. I am not speaking of the breeder who is selling stock and making records, but of the or for the farmer, who gets his living and pays for his farm out of the milk receipts.

FEEDING PROBLEMS.—A point connected with animal development which does not receive full consideration, unless it is from farmers who milk their cows as near as possible to freshening time, is the character of the food fed during the late period of gestation. This idea will apply as forcibly to the heifer with her first calf. Farm-grown foods are usually of the carbonaceous order, having a nutritive ratio of 1:7 or wider, not well suited to the development of the young calf nor the building of an udder without inflammation. Otherwise good dairymen object to a grain ration from Fall to Spring for a heifer preparing to drop her first calf, fearing udder troubles. Many years' experience has confirmed an opinion that no such danger is imminent, and I do firmly believe that such a well-balanced ration as wheat bran, oats, mixed hay and silage, or if all home-grown, oats and peas, mixed hay and silage, fed in such quantities as the individual may require for steady growth and health, will develop an udder of more capacity, and the good cows without large udders are in the imagination, whatever may be our theory or conception of milk secretion.

CLEAN VESSELS.—So many of the young things that have been raised on everything but milk seem to require such an an abnormal amount of food, or else are mincing and dainty. The calves usually suffer with periodical scouring, due to over-feed on the days of excessive thirst or hunger. I speak from experience. We have tried everything to take the place of milk. I am ready to admit that I don't know any patent combination to take its place, and we have come to give fresh, new milk in varying quantities if skim-milk is not at hand. Of course, it is expensive, but better not to raise the calf than do as we have at times tried to do. Small quantities of feed, and not overfeed should always be the rule. I wonder whether every dairy farmer reader of THE R. N. Y. scrubs and scalds his skim-milk or whey storage barrel or tank every day. As I ride through our town whey barrels are out in the sun without cleaning, until one locates them without sight. Is it possible for young calves' stomachs to digest this army of germs? A calf that can live through this should certainly have a constitution and be hardy. Constitution, digestion, a good udder; that's enough. Horsemen say: "Give me good feet and legs and an appetite, and we will do the rest." Give me the above mentioned essentials in a cow, and I think we can make a good, clean 10 per cent profit.

H. E. COOK.

More Kicking Cures.

I see that H. W. C. is troubled with a kicking cow. I suppose he has received lots of advice about managing her, but think he might like my way. I take a leather strap and pass it around the dew-claw of the right fore leg, and through the loop raise the foot up and buckle the strap around the leg. V. G.

Maine.

My plan is to take a strap about 2½ or three feet long with buckle on one end, and put it around hind legs just above gambrel or hock joint; cross it between legs and buckle it up tight as may be necessary on outside of leg next to milker. It will be in shape of figure eight when on. I have used this plan about 14 years on several different cows, and never saw one yet that could kick. I am using it every day on two cows with good results. It is easily put on and taken off, and the cow cannot hurt herself nor the milker, as I have known some to do with strap or rope around body. Let the Hope Farm man try this on Julia and report result.

Pennsylvania. J. O. L.

We have Mr. Stewart's "self-cleaning stable," or steel grating for 24 cows. It is very nice to keep cattle clean. Ours is in basement on south side of barn, over stone cement gutter. It would save lots of work if it could be arranged to clean out right through bottom of gutter into cart. J. T. S.

Massachusetts.

MARK LANE EXPRESS tells of the conviction of the proprietor of a butter factory, who was charged with adulterating the butter with milk and water. Special machinery had been devised for forcing moisture into butter, and some samples analyzed contained 10 per cent excess of moisture. As this appeared to be a clear case of fraud in selling milk and water at the weight price of butter, a fine of $100 and $75 costs was imposed.

Shoo Fly is the Original Stock protector of 1885. There are many imitations—*no equals* "I have used thirty (30) gallons annually the past seven years on my herd—it is effectual and cheap."—H. W. Comfort, Fallsington, Pa., Ex-President of Pennsylvania Dairy Union —*Adv.*

Sharples "Tubular" Dairy Separators

the latest product of the world's leading Cream Separator manufactory.

HIGHEST PRIZE (KNIGHT'S DECORATION) AWARDED AT PARIS.

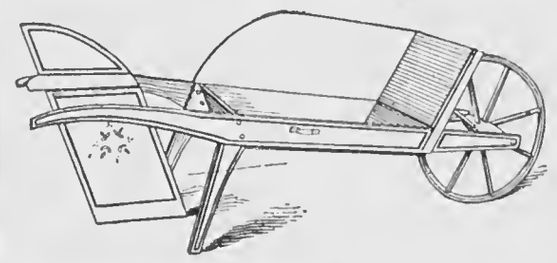
No disks to bother with and wash. Are very easy turners.

Guaranteed to produce enough more butter than the best competing separator to pay 6% on whole first cost of machine each year. Five sizes—$50 to $200 each.

Valuable book on "Business Dairying" and Catalogue No. 153 free.

Sharples Co., Chicago, Ill. P. M. Sharples, West Chester, Pa.

WHEEL BARROWS.



Flat hickory spoke, 22-inch wheels, shrunk steel tires, one inch wide. Strong enough for heaviest load, light enough for the boy's use; nicely painted, and an ornament to your premises. Price $3.50, direct from factory. Hickory spoke wheels alone, fully ironed, $1.25 each. The boys can make the bodies on rainy days. DON A. GILBERT & CO., Bainbridge, N.Y.

Wilder's Stanchion

—being an improvement over Smith's. Lightest, strongest, quickest, safest swing stanchion made. Has steel latch and automatic lock. Becomes stationary when open. Animal cannot turn it in backing out. Made of best seasoned hard wood. Pins for fastening with every stanchion. Send for testimonials.

J. K. WILDER & SONS, Box 20 Monroe, Mich.

MODERN CRANBERRY CULTURE.

ESSENTIAL PRINCIPLES OF THE BUSINESS

How to Start a Bog.

A GOOD BUSINESS.—That all interested in cranberry culture will object to some of the methods described here is expected, and perhaps there may not be any one grower who will agree with them all. I am not going to complain of this, because most of the methods herein described are original with us, and as yet have not been adopted by other growers to any great extent. With present prices of cranberries, ranging from $3 to $6 per barrel, it becomes necessary to depart from the old methods and resort to those that are practical and up-to-date in order to eliminate as far as possible the element of chance in the business, and insure a profit to the grower. What I desire to do is to describe in plain English how to select, prepare and care for a cranberry bog, and in doing this I shall refrain from advancing any theories, and shall describe only those methods that I know to have been successfully tried. At the outset it is stated that these instructions are intended to apply with equal force to all localities and conditions, but any exceptions will be carefully noted. Formerly, any swamp that could not be flowed at short notice to prevent frost from injuring the fruit was considered worthless, but with the introduction of earlier and hardier varieties of fruit this theory has become exploded, and among the most successful bogs there are many "dry" ones.

WATER.—Of course water has its uses in cranberry culture, and I shall speak of them later, but at the beginning of making a bog it is more important to get it off the swamp than to get it on. This brings me to the subject of drainage, which is really the first thing to be considered, and I earnestly advise everyone before investing any money in rough swamp to be sure that it can be properly drained. It is imperative that the surface of the bog be kept dry from the middle of April until after harvesting. It is to be expected that during the Winter more or less water will collect in swamps, especially where the surrounding land is high. This does no harm, but is rather a benefit if the bog is submerged deep enough. It is dangerous, however, to have it flooded but a few inches, for if ice is made among the vines, it will not only winterkill them, but is liable to pull them out by the roots. Either flood deep or not at all is a good rule to follow.

MARSH OR SWAMP.—The next thing to consider is the swamp itself, and right here is a good time to distinguish between marshes and swamps. Marshes, according to my idea, are tracts of low, wet land that are covered with grass, and so far as I can find out are worthless to cranberry growers. In view of the fact that one man I know vainly spent $200,000 in trying to grow cranberries on them, I advise others to let them alone. Swamps, generally, are covered with wood, and while those that are covered with maple or huckleberry are considered the most valuable, on account of the rich peat bottom, any swamp is worth making into bog provided it does not contain alkali, lime or oil. Another thing that is very important in the construction of a cranberry bog is coarse sand or gravel. Either through ignorance of its value, or on account of the extra expense, this item has been slighted by many growers, to their cost. Experience teaches that it is indispensable in the making of a successful bog for the reason that it checks a too rapid growth of the vines, and prevents them from growing woody and unfruitful. It also keeps the weeds down, and prevents the sun from drawing the moisture out of the peat bottom of the swamp. The sand should contain no alkali, lime or loam; should be loose and gravelly, and all stones larger than a hen's egg should be taken out before it is spread on the swamp. Just what a swamp that is suitable for making into a cranberry bog is worth in its rough state depends considerably on its location. On or in the vicinity of Cape Cod, Mass., its value is not far from $100 per acre, and much higher prices have been paid for exceptionally good pieces.

A PAIR OF VETERAN FARM HELPERS. FIG 194. SEE PAGE 478

CAPE COD FRUIT.—While it is a fact that Cape Cod cranberries bring better prices than those grown elsewhere, it does not follow that they are the best, and I believe, in fact I know, that they can be grown equally as well in other places. One reason why Cape Cod berries are so good is that there cranberry culture has been a succession of experiments for more than 30 years, with the result that the culture has been reduced to a science, and at present each grower knows just what variety is best suited to his bog. Another reason is that in making a bog there they spare no expense, for they know that a bog properly made will bear good crops, and is easily cared for.

THE COST.—The cost of making varies, according to whether the drainage is natural or artificial, and how far one has to go for sand, but the average price is not far from $200 per acre. Allowing $100 as the value of the rough swamp, we have a total cost of $300 per acre for bog that is ready to set out. The cost of caring for an acre of bog for four years, or until it is ready to bear a full crop, is very small, and the berries harvested the second and third years ought more than to cover all expenses of care. When the bog is four years old it is worth at least $1,000 per acre, being an increase in four years of $700. It is no wonder that cranberry culture is the chief industry of Cape Cod, and that rough swamps bring such high prices.

SOME ESSENTIALS.—Many farmers in other places who have tried to grow cranberries and failed have thought that their swamps were not adapted to the fruit, and complained that there was no money in the business. Upon investigation we found that either ignorance or a mistaken sense of economy prevented them from properly preparing the bog. Some, after removing the wood from the swamp, tried to plow and harrow the surface as if they were preparing a field for turnips. Others spent considerable money in ditching and grading, and then spoiled the whole thing by putting on loam instead of sand, the loam being easier to get at, and costing less to put on than sand. It is the results of such attempts as these that have discouraged others from going into the business, and it is a fact that there are swamp owners within 50 miles of Cape Cod who do not believe there is a profit in cranberries. They claim that they have tried it, and know all about it, and that at present prices there is no money in it; that it costs too much to harvest the fruit; that they never had good crops; that their vines were eaten by worms, and that their bogs were overrun with weeds. No one is to blame for this state of affairs but themselves. If they had spent a little more money in making the bogs properly at the start, and then taken care of them afterwards, they would have had no just cause for complaint. In a previous article I have briefly explained how to prepare a cranberry bog, but it will do no harm to explain it again a little more carefully, for since writing it I have been in receipt of numerous letters from persons who were interested, asking for more information. "Whatever is worth doing at all is worth doing well," is a motto that can be applied to the making of a cranberry bog, and I presume it is the same with the description of the making, therefore I shall reserve that for another chapter, in which I shall carefully describe the most practical methods and also the implements used in construction. F. A. MAKEPEACE.

Massachusetts.

OATS AND PEAS.—Fig. 197 shows a crop of oats and peas at the New Jersey Experiment Station—ready to be cut. This combination of green food is a favorite one with many dairymen. It gives just about an ideal green forage ration for milch cows. When making rations out of other green crops Prof. Voorhees takes oats and peas for the standard. The picture shows the oats well headed out, and this is about the right time for cutting either for green forage or hay. Oat and pea hay, when well cured, makes a good Winter forage to feed with silage. We think it better to make good hay of the crop rather than to let the seeds ripen fully and thrash them out.

A VERY PROMISING NEW STRAWBERRY.

On June 14 I visited the farm of Thomas R. Hunt, of Lambertville, N. J. I had heard of Mr. Hunt as a successful farmer who makes use of an irrigation plant. He wrote about a heavy piece of grass, and the chief object of the visit was to see how it compared with Mr. Clark's famous field. The grass was there, but I was surprised to find about the best collection of seedling strawberries I have ever seen growing together. Mr. Hunt has been growing seedlings for many years. He has probably tested nearly 2,000 in all, but at last has half a dozen or so that seem worth all the waiting and watching. The berry shown at Fig. 196 is one of the best we have seen. There were plenty of specimens fully as large as the one pictured here. The color is a dark, rich red, the flavor is excellent and the flesh is solid and firm. There was but little appearance of rust on the foliage, which is strong and thrifty. Mr. Hunt calls this new berry President, and it certainly looks as though it were well qualified to stand at the head. There are several other good seedlings. One called No. 8 has been quite largely planted by nearby growers as an early variety, and another called Amwell is locally popular. The President is the best of the lot, and looks like one of the season's leaders. I know how disappointing some of these new varieties often prove. A few years ago I gave what seemed to me the facts about Gladstone. At Mr. Merceron's place it was certainly a wonder, yet at Mr. Hunt's, with the same treatment which all others received, it was inferior to President or Nick Ohmer. This seems to indicate that many varieties of strawberries are very superior in certain localities or under certain conditions, and yet fail when deprived of just the soil or treatment which they need. Perhaps the President will prove to be of this class, but as grown by Mr. Hunt it is the finest berry I have seen this year. On June 24 Mr. Hunt wrote the following letter:

"Thinking you might like to have an estimate of the yield per acre of my grass, I write the following: The plot was 254x224 feet, and contains about 1.3 acre. The hay was hauled in seven loads, the last two not being quite full, but the others being loaded wide and long, and as big as could be hauled into the barn. We estimate the weight as at least five tons, but that being only guesswork, won't go. The bulk can be testified to. If it had been allowed to stand until it was older, and got the weight it should have had, there would surely have been more than five tons.

"The strawberries are doing fully what they promised, especially Nick Ohmer. The President has gone clear out of sight of anything I ever saw in the strawberry line. While not quite so large as when you were here, the form and color are still perfect, and the berries are perfectly solid yet. It has held out this way in spite of the fact that we have had no rain for over two weeks, and will bring up the last berry. Nick Ohmer is still very nice, and although run down considerably in size, is still extra fine, and I command the market here. Have not sold any of the good berries below 12 cents wholesale, and only a very few crates of poor stock at eight cents; have sold more than enough at 13 cents to overcome that. I think I should have put my irrigating plant in operation, but have put it off waiting for rain until it is too late now probably to accomplish any good."

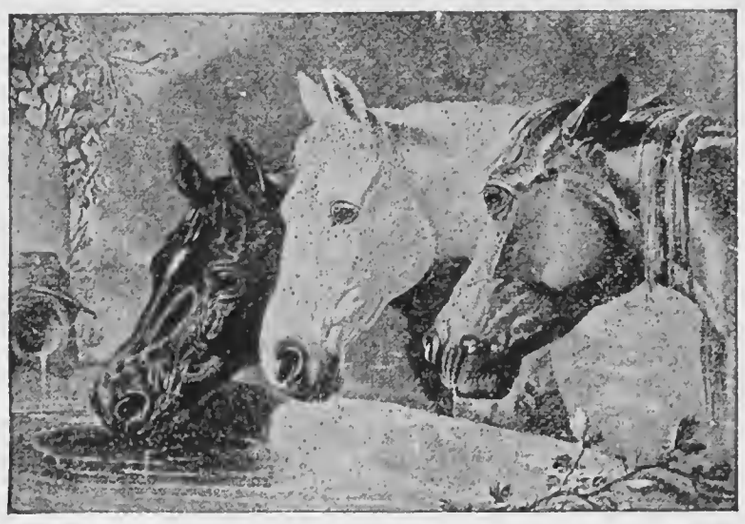
The grass mentioned was mostly clover—the Timothy having been beaten down by heavy rains and smothered by the clover. It was seeded after strawberries and onions with little working of the soil. This matter of the grass and the irrigation is so interesting that I shall make it the subject of another article. H. W. C.

CHILDREN AND CHICKENS IN CUBA.

Last year we printed several brief accounts of the work done at the Industrial Home at Matanzas, Cuba. Elmer E. Hubbard, a former New York State boy, established a home for orphan children. He has had a hard struggle to maintain the home, for the people who know of such things and would be glad to help them have many calls. It will be remembered that Mr. Hubbard imported Brown Leghorn hens from the States. The following letter from him gives a new side to the Cuban problem:

Last November we had to give up the building and 70 acres of land, where we had the boys and the hens, and let the hens go back to the Government, which had loaned them to us, and moved the boys into the girls' home. In this one home we cared for about 40 children through the Winter, and tried to make it a real home to them as much as possible. Two months ago we thought it time to have two homes again, and now are excellently located—the boys in a home on the hill with about an acre of garden attached, and the girls in a home on the shore of the bay which was formerly the home of the Spanish governor of Matanzas at the time when some of these children were made orphans. While I have found much satisfaction with the children I can't say that I have been very successful with the hens and the garden. With so many small untrained children to look after, and with little or no grown-up Cuban help, we two or three Americans have had our hands nearly full of the indoor work, and could not give much attention to outdoor work. Though we could sell eggs for from 25 to 30 cents a dozen all through the Summer and Fall there was not much profit in 20 eggs a day from 100 hens with corn at 90 cents a bushel and with a very long moulting season in the Fall. About 15 of the hens died in the six months that we had them.

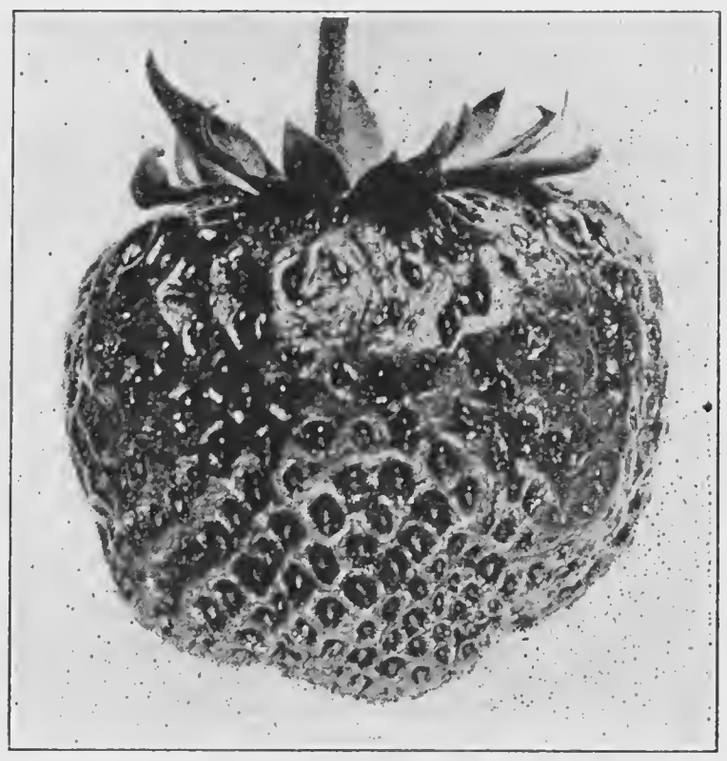
Our boys have raised some vegetables, especially radishes, beets, squash, lettuce and egg plant, but it seems that not much successful gardening can be done in Cuba without an artificial supply of water. Even now in the so-called rainy season, after a week of pouring rains the very porous soil in the following week of hot sunshine becomes so dry that plants that



TAKE A DRINK WITH ME! Fig. 195.

have not their roots reaching far down from the surface do not make much growth, and in the dry season, when we have weeks and months of almost constant sunshine, abundant daily watering is necessary to make things grow. I hope that some time we can have one branch of our work so located that we can do some profitable gardening.

With all the famed fertility of the Cuban soil it would seem that we ought not to have to pay long the present prices for what we have to eat. Potatoes, $1.40 a bushel; beans, $3.20 a bushel; beef, 15 to 20 cents a pound; salt pork, 12 cents a pound; butter, 40 cents a pound, and oleomargarine, 20 cents a pound, with nothing much cheaper to take their places. I have just received two barrels of beans and four barrels of wheat from western New York. The cost of the beans there was $1.80 a bushel, and the freight and duty made the cost here $2.60 a bushel. The wheat,



THE PRESIDENT STRAWBERRY. Fig. 196.

which cost there 80 cents a bushel, cost here $1.46.

We shall be very glad if we can see our work grow, for there is certainly need of much more being done. Only to-day I have gone to see a widow with her seven children, three of whom she wants us to take into our homes. They lost their home and property during the war, and her husband died, and she by strength of body and strength of character has kept all her children with her till now her physical strength is nearly gone, and she is broken down in health. She has taken such good care of her children that they are a family of which any mother might well be proud, but now some one must help her to take care of them. There are many similar cases.

ELMER E. HUBBARD.

TAKING A DRINK.—The picture shown at Fig. 195 is taken from an excellent leaflet published by the Humane Education Committee, Providence, R. I. This leaflet is an appeal from the horses to their owners and drivers. During this hot weather the horse will highly appreciate an invitation to take a drink. Horses suffer greatly from thirst when worked hard in the hot sun. It is not only humane but profitable to keep them well supplied with water.

BIG STORIES OF APPLES.

On page 371 we gave some figures showing the income from a 14-acre apple orchard owned by Mrs. L. E. Allen, of South Hero, Vt. The net cash returns for apples were $2,564.14! Prof. F. A. Waugh, who made the report, says that some people call this "a fish story"—too big to be true. He has secured the following figures from two other Vermont orchards:

Mr. Lucian Allen, also of South Hero, has 300 bearing apple trees, covering between five and six acres of land. From these he sold in New York 237 barrels of the crop of 1900, for which he received a gross return of $875.25, or an average price of $3.40 a barrel. Freight, cartage and commissions ate up $174.75 of this sum, leaving a net cash return of $700.50. These figures are taken directly from the returns of the commission man, (and the commission man seldom returns more money than the fruit brings). In addition to the $700.50 received for apples sold in New York, Mr. Allen sold a considerable quantity at home, from which he realized an additional $198.50. This makes a total of $899 for the year's crop, or $150 to $180 an acre. Another Vermont apple grower, who objects to having his name used, but whose accounts have been examined and found correct, has made still more remarkable sales. Last year his total sales (not net) were $3,543.25 from 10½ acres. One single block of trees, covering 4½ acres gave a net return of $1,272, or over $282 an acre clear profit on the farming.

Prof. Waugh vouches for these figures, and we believe they are correct. We have looked over the figures of several New England fruit growers, and know that they received nearly as much per acre or tree as did the Vermont farmers. What are we to conclude from all this? That New England is a land overflowing with fruit and money, and that any man or any soil can earn this amount of cash? No—that is the most dangerous conclusion that could possibly be drawn from these accurate figures. There are soils and locations peculiarly adapted to the development of certain varieties of apples. There are also men who by natural inclination and long and patient study come to know just how an apple tree should be cared for. When the capable man grows apples on the fit soil the results may be in time like those given above. The careless man on the best soil, or the best man on the unresponsive soil, can never reach them. There are many who start to climb the rocky road to the highest possibility in farming—yet few there be who do not wait by the wayside.

BEE STINGS FOR CURING RHEUMATISM.

We frequently see items floating in the papers regarding the effect of continued stinging of bees. It is claimed that such stinging is a reasonably sure cure for rheumatism. As we understand it, the claim is that the acid developed by the sting of the bee renders the patient immune to the disease. It is also said that after a person has been stung a large number of times, he is not likely to feel any ill effects from future stings. What is your opinion regarding this?

This matter has been up in the bee journals for years past; but the testimony, like that in regard to many other things, seems to be conflicting. We have been compelled to decide that, while stings may be a perfect remedy for certain kinds of rheumatism, it is equally certain that they do not always cure other kinds, and that it does not work alike on different persons. I have conversed with bee-keepers who declared they were troubled with rheumatism during the Winter, when not working with the bees; but as soon as the season opens up, and they get stung more or less every day, the trouble disappears entirely. I have sometimes thought the outdoor work, warm weather and perspiration may have had something to do with it as well as the stings. A medicine is prepared directly from the poison sac of the bee, removing it for this special purpose. We have at different times filled orders from manufacturers of medicines, for bee stings taken directly from the live bees. But I am not satisfied that the poison induced by the sting of a bee has any direct effect on rheumatism. I say this when I remember the wonderful cures that are being performed all the time with electropoise, absent treatment, mind cure, and a thousand other whims and superstitions. For years I labored to convince the people that electropoise had neither sense nor science about it; but long strings of testimonials from multitudes were against me, and so I gave up in despair, deciding to "let the world wag." Soon after, however, one after another of the victims who persisted so strenuously that it was a scientific apparatus, opened up a "new era," etc., dropped it of his own accord, and now it has gone out of sight. Perhaps I am a little hasty in thinking the bee-sting cure may be something along this line; but for some reason or other but little is said about it now, even though it made quite a stir when the matter first came up, years ago. It is true beyond question, I believe, that, after a person has been stung a sufficient number of times, the poison begins to have less effect, and finally produces no swelling at all; and this condition of the system seems to remain permanently. When I first commenced with bees, every sting produced such a swelling that my friends hardly knew me. In a few months, however, this gradually ceased, and year after year when I began again with the bees in the Spring, the stings produced only a momentary inconvenience. It is now many years since I was stung repeatedly; but I always find that, when it is necessary for me to go among the bees, I am just as immune in regard to the swelling and pain as I was 20 years ago when I was stung dozens of times daily.

Medina, O. A. I. ROOT.

CHEMICALS, CLOVER, COWS AND LIME.

Some Methods and Results Analyzed.

PART II.

WHY USE LIME?—There are some fields around Cranbury that seem to blush for shame at their sad and sour condition. They are red with sorrel. Great patches of this red signal of distress are to be seen here and there. In one field used for a pasture the sorrel was so thick that one would think the cows were in danger of giving buttermilk or clabber. Mr. Lewis is satisfied that the appearance of this sorrel indicates an acid condition of the soil which is not favorable to the growth of clover, grass or grain. It will often be noticed that on soil which we know is strong and well fertilized clover will not start readily, while Timothy and other grasses gradually fall out, and sorrel comes in freely. It may be that a growth of sorrel does not always indicate that the soil is too acid, but it is a pretty reliable indication that lime is needed. Mr. Lewis had noticed for several years that the catch of clover was not satisfactory on his farm, especially on some of the fields. My own experience has been that different soils on the same farm, or even close together, may vary greatly in their need of lime. This partial failure of the clover and the appearance of the sorrel on neighboring farms convinced Mr. Lewis that liming once in five years will pay. He selected the wheat crop as best in all respects for the lime. One object is to use the lime so as to keep it as far as possible from the potato crop. This is because lime corrects the acid condition of the soil, and encourages the development of the scab germ on potatoes. If there are any of these germs on the seed or in the soil lime will surely produce a scabby crop. As wheat follows potatoes in this rotation it makes the safest point for the lime. The liming was begun in the Fall of 1899. Twenty bushels or 1,600 pounds per acre were used. The best way to use the lime is to harrow it in after plowing, although Mr. Lewis says he has in some cases broadcast it over the growing wheat. The results of the first application are quite evident in the clover and grass which follow last year's wheat. This year's clover too has given a fine "catch." Mr. Lewis feels confident that this use of lime once in five years will help the farm. He does not regard the lime as plant food. The fertilizer used on potatoes contains plenty of lime in a condition to supply the food needs of the plants. The lime used on the wheat unlocks plant food now in the soil, and makes it available, and neutralizes the acids so that grain, clover and grass may grow to better advantage. It is the difference between food and medicine. There is no thought of using less fertilizer or less manure, but it seems evident that the lime will enable the crops, especially the clover and grass, to make better use of the soil and what it contains.

A FIELD OF OATS AND PEAS READY TO CUT. FIG. 197. SEE FIRST PAGE.

POTATOES.—The potatoes on this farm were the best I have seen anywhere this year. They are in a well-drained soil—perhaps the best field on the farm for potatoes. The soil was well fitted and the potatoes were started right. They kept growing slowly through the wet, dull weather of May, making a slow, healthy growth, so that when the sunny days finally came they were not stunted, but started off rapidly. One secret of successful potato growing is to keep the crop moving. It must never stop or stand still, but must be forced from the time the plants show above ground. Mr. Lewis feels confident that the crop will be at least a fair one this year. The plants are large, dark green in color, and with thick, heavy stems. "I know what is behind them!" says Mr. Lewis—meaning that he knows that the fertilizer close to their roots contains everything they need to produce a full crop. The soil, too, is well filled with moisture, and by means of good cultivation much of this can be retained. In planting potatoes this year something of a new plan was tried. The Robbins planter was used, and the furrows were first opened alone—without any attempt to drop fertilizer or seed. Then the fertilizer feed was reversed so as to drop the fertilizer before rather than behind, and the machine was run along the open furrows. In this way it is thought that the fertilizer was put just where it was most needed, and the extra working seems to have paid.

FERTILIZER PROBLEMS.—Mr. Lewis has used the same brand of fertilizer for many years. Farmers are frequently tempted to change from high-grade to low-grade goods, the chief argument being a lower price. Many of these men have studied the fertilizer problem, and know something of the value of plant food. After a year of light crop or low prices they are quite likely to drop the fertilizer which has proved reliable through a long series of years, and try some new mixture which is offered for several dollars less per ton. Sometimes a single season's test indicates that the lower-priced mixture by the side of the standard goods will give nearly as good results in crop. They then conclude that it is just as good. Mr. Lewis says that during the 20 years he has been working the farm through the present rotation he has had but three maximum crops of potatoes. What he means is that only three times in 20 years has he been able to produce an average of 340 bushels per acre, and these results were obtained on three different fields. The same fertilizer has been used all through this period, with the same culture and care, yet all the conditions needed to produce a full crop have been present only three times. Mr. Lewis argues from this that a single year's results from a change of fertilizer prove little or nothing. The only way to fertilize potatoes is to use large quantities of a mixture known to suit the crop, and thus be always prepared for a combination of conditions that will just suit it. The experiment with the poorer goods might be made in a year when the best results were possible, and in that case there might be a serious loss. When asked whether the other crops in the rotation, wheat, grass, clover and corn, varied as the potatoes do, Mr Lewis said no—that under his system they were always sure of fair crops. This year's grass is very heavy, while most of the wheat looks good for 35-40 bushels per acre. Mr. Lewis says that when the potato crop is average or below he does not use fertilizer on the wheat, since there is enough left by the potatoes. After a very heavy potato crop he would probably use extra fertilizer.

H. W. C.

GOOD CULTURE FOR CORN.

A good crop of corn can be raised while Summer fallowing, and all the weeds and foul stuff can be killed out just the same. The better you cultivate your corn the better corn you will have, and also the better wheat. Fit your ground well enough for a garden; then mark it both ways. I plant with an American Standard planter, and can easily plant seven acres a day; then as soon as I get my field planted I roll the ground, and when the corn is rooted in the hill so that it won't be knocked out of place, I give it a thorough harrowing with a 60 spike-tooth harrow going both ways. The trouble with most farmers is that they get in too big a hurry to plant. They say they will fit their ground after planting with good cultivation, but this will never do. After my corn is nicely up I harrow it again; the harrow loosens the earth right in the hill. You must have the teeth in your harrow good and sharp or pointed. The first time that I did this I almost shut my eyes, it seemed such harsh treatment for the tender corn, but in a couple of days I saw that it had done no harm to the corn. I never saw any hand hoeing or cultivating that did corn so much good as this did. Of course the field must be free from sticks, large stones and sods or the corn will be pulled out.

I like to use the old-fashioned one-horse cultivator, for I always cultivate my corn diagonally through the rows. Cultivating this way the hills do not come opposite each other, the operator only has one hill to watch, and can get much closer to the hill. Therefore the cultivator can be set fully as wide as the rows, and can be jogged over, so as to root grass and weeds almost right out of the hill. When a two-horse cultivator is used you have to allow for the spreading of the hill and set your cultivator accordingly. I have no two-horse cultivator, but I have a common two-horse disk, and I take off the two inside disks and can cultivate with it till the corn is from 18 inches to two feet high, straddling the rows the same as with the two-horse cultivator, and can do just as good and thorough work with it. I have never had a failure of corn or wheat since I followed this method. Corn has always gone over 100 bushels to the acre. I don't like to see a good clean corn stubble go over the Winter. I always think what a good opportunity is lost for raising a crop of wheat. I like a good cover crop of some kind on all of my land.

A. L. S.

Huron Co., Mich.

LATE POTATOES AFTER EARLY PEAS.

I tried an experiment this year with Canada peas and potatoes that may be interesting to your readers. The large potato growers in this vicinity generally plant in June. We tried it last year for the first time, and for growing potatoes cheaply it was a success. I have been a market gardener in years past, and raised a great many peas for market, one year having put them into market on June 4. My own experience is that peavines plowed under are a great benefit to the soil, but I never plowed them under until the vines were dead. What benefit green vines plowed under will be to the soil or to the potato crop I am unable to state, but hope to be able to know all about it when the potato crop is harvested. We plowed a 10-acre field on April 10, 11, 12, dragged it and drilled in the peas April 16 and 17, putting 1½ bushel of seed and 200 pounds of potato fertilizer to the acre. Following this was one of the heaviest, wettest and most disagreeable snowstorms ever known in this vicinity. The peas commenced to break through the ground on May 1. About this time we were able to put in five acres more. To-day the field is a solid green; I measured the vines, and they are 19 inches high and seven branches on each stock. My neighbors admit that the crop of peas is a success; therefore it must be so. The season all know has been backward. Weeds have come up between the drill rows so thick that there is no ground visible. The continued rains have delayed all farm work, and some farmers had not finished planting corn by June 15. Some had finished planting potatoes, while most of the large potato growers were waiting for the ground to get dry enough to plow. I began to plow these peas under by June 17. Whether this will be a success in growing potatoes the future alone can tell. As a weed killer and soil renovator there can be no doubt of its being successful. The weeds will all be plowed under. The ground being plowed twice and the extra cultivating to put in the peas and the potato fertilizer must help the crop of potatoes whether the peavines will or not.

K. S. WING.

Portage Co., O.

R. N.-Y.—We would like to know the result at digging time. The plan seems a good one in theory, but in our own location late planting seldom gives a good yield unless we use second-crop seed. For the potato crop we would prefer the green vines to dead ones, and the peas might follow rye or Winter oats, thus filling the soil with humus.

Farmers' Club.

Seeding Grass With Buckwheat.

What are the chances of obtaining a good catch of Timothy and clover by seeding them with buckwheat this Summer?

This system has been used in this State, and with satisfaction, provided the season is at all favorable, and the buckwheat does not grow so heavy as to lodge, and thus smother the young grass. Personally, however, I would prefer to take chances on plowing the land now and keeping it raw until July, and then seeding to grass. You would stand a much better chance to get a good catch now and a crop next year, than if seeded with buckwheat.

E. B. VOORHEES.

New Jersey Exp. Station.

We have never attempted to sow Timothy or clover in connection with buckwheat, and I do not know of anyone having done this. The habit of growth of the buckwheat is such that I should not anticipate satisfactory results from such a combination. Possibly grass and clover might make a good start should the buckwheat be sown very thin, but if sown in the usual quantity the crop of buckwheat from the branching habit and broad leaves of the plants, would be sure to shade the ground to much greater extent than would be favorable to the grass. I should prefer planting the land to corn. Corn for the silo might be best, but late sweet corn would answer. I should sow the mixed grass and clover seeds in the corn about August 1.

Mass. Exp. Station. WM. P. BROOKS.

I hear of many persons who have seeded not only with Timothy and ordinary Medium Red clover, but with Crimson clover in buckwheat most successfully. The time for sowing buckwheat gives opportunity for fitting the land well. I may say, however, that better results are secured if the land is plowed and left to weather for two or three weeks before the seeding, which gives time for harrowing and compacting the sub-surface soil. However, it is now too late to give much time for weathering. Usually, buckwheat ground is very poorly prepared. Harrow, roll, harrow, and then harrow again before sowing. Do not sow over one-half bushel of buckwheat per acre. Even a less amount would give better opportunity for the clover and grasses. Use commercial fertilizers rather liberally. We have discovered in the last few years that few crops respond to a judicious application of fertilizers as promptly as does buckwheat. The fertilizers will assist materially in getting a perfect seeding of grasses. I. P. ROBERTS.

New York Exp. Station.

An Experience With Spraying.

G. W. H., Ogle, Pa.—This season has been my first to try spraying apple trees. Although it rained a great deal, I kept right at it; used Bordeaux Mixture with London purple at the rate of four to five ounces to 50 gallons Mixture. Could this be too much London purple? I find a great many of the leaves are scorched; also some of the fruit on upper side. The trouble seems to be the worst on early varieties, and on the sunny side of the trees. Could this have been caused by spraying when the sun was shining direct on the tree? Will the fruit thus damaged grow to maturity, or will it be one-sided or drop off?

ANS.—London purple is not nearly so safe to use as Paris-green, for it varies in composition, and often contains much free or soluble arsenic, which is what burns foliage. But I cannot understand how so small amount as G. W. H. used, and in combination with Bordeaux Mixture too, could have burned apple foliage. Possibly the ingredients of the Bordeaux were badly combined, so there was a surplus of the copper-sulphate solution. With properly made Bordeaux Mixture we should be able to use Paris-green at the rate of one pound in 100 gallons on apples without danger of injuring; this is the strength now used by many New York apple growers. Spraying when the sun was shining should not have caused the spray to burn the leaves. I cannot determine from the description of the injury to the fruit whether it will outgrow the affection or not. Doubtless a few days of this growing weather will soon demonstrate one way or the other.

M. V. SLINGERLAND.

Spraying for the Codling Moth.

G. H., Walla Walla, Wash.—Which is the best spraying material for Codling moth only, irrespective of cost, sulphate of copper solution, Paris-green and lime, the Bordeaux Mixture, the ammoniacal mixture, or the London purple with lime? Also, why is it, as great stress is put forth in your valuable article of April 20 in THE R. N.-Y. on spraying early, that my early Summer apples last Summer were not affected with five per cent Codling moth, while with Fall varieties, at least 50 per cent was affected? My first spraying was not done for three weeks after the last blossoms had fallen off, but I do not think I sprayed later enough in the season.

ANS.—A solution of sulphate of copper, or Bordeaux Mixture, or the ammoniacal mixture, are all fungicides, and will thus prove of little avail against the Codling moth, and they should be used for combating fungous diseases only—like the apple scab, etc. To check the Codling moth with a spray it is necessary to use a poison, and there is little choice between London purple and Paris-green, provided plenty of lime is used with each. New York apple growers are using a poison at the rate of one pound in 100 gallons of Bordeaux Mixture or lime and water; many are using white arsenic boiled with lime or sal soda, and find it just as effectual and much cheaper than Paris-green.

The all-important time to spray for the Codling moth is within a week after the blossoms fall, so as to get some of the poison into the cup at the calyx or blossom end of the fruit before the calyx leaves close up this cup. It is in this cup or cavity that most of the first brood of the caterpillars of the Codling moth spend the first few days of their life, and get their first meals. A thorough spraying at this all-important time in the growth of the fruit will be more effectual in reducing the number of wormy apples than three or four or more applications after that time, although oftentimes these later sprayings are necessary, and materially help in the warfare, especially in the West, where the insect has more than one brood annually. Do not fail to spray at this opportune time. Where the Codling moth has two or three broods, as in the Far West, it will pay to supplement the poison spray with the banding system; that is bandages of burlap or some similar material put around the trunk of the tree and examined every week to kill the caterpillars which have crawled under the band to transform. This weekly examination of the bands is all-important, and quite necessary to the success of the method.

M. V. SLINGERLAND.

Grafting Questions.

W. J. G. W., Raleigh, Tenn.—1. I would like to bud the pecan on the hickory, and wish to know how it is done. I know it is difficult to do, but will not be discouraged by failure. 2. Can the Scuppernong be grafted on the Muscadine? If so, how would you proceed? 3. Name some work on grafting and budding that would be of value to the novice.

ANS.—1. The best method of budding the pecan on the hickory or upon pecan is by the ring method. This is done by selecting scions that have well developed buds, and if they have those that project into spurs they are very good. Cut out a ring of bark from the scion about an inch or two long. Place it on the stock as a pattern and cut out a piece of bark just the size to admit it. Bind it fast with waxed cloth, and it will quite surely grow. This should be done when the buds and stocks are well grown, which will usually be about August or September. 2. The Scuppernong grape may be grafted on the Muscadine, but with great difficulty. The stock should be cut off a few inches below the surface of the ground, and trimmed to a sharp wedge at the top. The scion should be about a foot long and a slit or gash cut in it about the middle. This slit should be straddled over the wedge of the stock, and the projecting butt end of the scion pushed into the ground. This makes a sort of combined cutting and graft, which is much more likely to grow than an ordinary graft. 3. The Nursery Book, by L. H. Bailey, which may be had through THE R. N.-Y., price $1, gives full directions for budding and grafting. H. E. VAN DEMAN.

Planting Asparagus in the Fall.

T. H. M., Niagara, Ont.—Have you any experience in planting asparagus roots in the Fall? I purpose trying two-year-old plants.

ANS.—We have seen asparagus successfully planted in the Fall in Tennessee, and see no reason why it should not succeed in your locality. In the asparagus regions about New York planting is always done in the Spring, but only, as we understand it, as a matter of convenience in arranging work. If planted the usual depth of three to five inches well covered and mulched to lessen heaving, it should not be harmed by frost, as it is a very hardy plant. As a rule, however, Spring is the best time to plant herbaceous subjects.

Starting Strawberry Seeds.

P. A. R., Gardena, Cal.—I would like some information in regard to growing strawberry seedlings. I find it hard to get the seeds to germinate. How should I treat them?

ANS.—Crush the strawberries in some kind of absorbent paper. Scrape off the pulp and mix with enough dry sand to separate the seeds, which may be immediately sown thinly, sand and all, in pots or shallow boxes of light soil. If the seeds are viable they should soon come up, and the little plants may be pricked out and transplanted to similar boxes or small pots as soon as they can be handled. The seeds should be lightly covered, and the soil kept moist, but not sodden, until they germinate.

Subduing Wild Growth.

L. D. L., New Market, N. J.—How can I get rid of briers in a sandy two-acre patch that I wish to use? The old farmers around here cannot see any way to subdue them, and their plows are not fitted to cut through them. I would like to learn the best way to treat the field and the best crop to cultivate. The land is old, and has been cultivated until the last few years.

ANS.—Apparently the only way to subdue wild growths on old fields is to cut down or grub up the worst growths, and tear up the soil with a strong plow. All roots and trash should be gathered and burned, and the field planted to corn, potatoes or some crop needing prolonged cultivation. Two or three seasons of persistent work should tame the wildest land if there are no stumps or thick roots.

New York State Fair

SYRACUSE

September 9 to 14, 1901

$65,000 in Premiums and Purses $65,000

It will be the Best Agricultural Exhibit ever held in New York State. The new mile track is in perfect condition. A new grand stand has been erected, and the Fastest Horses in America will compete for

$30,000 IN PURSES

The best Thoroughbreds, Trotters, Hackneys and Coachers in the country will be seen in the GRAND HORSE SHOW, which will be larger and better than last year. The grounds have been greatly improved and made beautiful by a trained force of gardeners. New buildings have been erected. Stock buildings thoroughly disinfected. Everything in first-class condition.

GENERAL ADMISSION, 25 CENTS

Send for Premium List. S. C. SHAVER, Secretary, Albany, N. Y.

PAN-AMERICAN EXPOSITION NOTES.

THE ROSE SHOW is one of the greatest attractions at the Exposition just now. There are extensive beds of Hybrid Remontants and others now in bloom, showing every color from the darkest crimson, such as Meteor, down through all the shades of crimson, red and pink to pure white Mme. Plantier. The beds have been beautifully planned by Mr. Wm. Scott, who has charge of the Department of Floriculture, and the planting and care of the beds has been all that could be desired. The cool weather has kept them back somewhat, but the rains have made them grow vigorously and now the warm sunny days have caused them to bloom most profusely. Such an exhibition of Hybrid Remontant roses is said by good judges never to have been seen before in America, and I am sure it is true. There are several displays of the Crimson Rambler, and there is one very large bed devoted to it entirely, which is at present a mass of buds, and within the next two or three weeks this variety will be a perfect glory of bloom. It is well worth coming to see, and those who visit the Exposition should not fail to make note of this and see one of the finest sights in the floral department.

STRAWBERRY NOTES.—The strawberry display is just now at its best and New York and Ontario make the best show, as we might reasonably expect, because of their nearness to Buffalo. Clyde is perhaps the most showy and prevalent variety on exhibition. Williams is the leading market strawberry of Ontario, and it certainly does remarkably well there. It is of a beautiful brilliant red color and a fair quality, but the larger berries have the fault of being somewhat furrowed on two sides, which is a slight objection. The variety called New York is particularly bad in this respect. In fact it is decidedly coxcomb shaped and all of the larger berries are considerably distorted and irregular, I am sorry to say, because in growth of plant and in some other respects it is quite desirable. The old Haverland holds its own very well, as it is not only of good shape and color, but very fine in flavor. The Aroma is one of the very good kinds, as it is neither too large nor too small, clear red without any green tip, and of a delicious flavor. It seems to stand shipment very well. Several shipments of the Clark strawberry have come from Oregon, and after being transported over 3,000 miles, at least half the amount sent has reached here in very good condition. This is evidently a good shipper. It is the leading strawberry of Oregon, and especially of the Hood River section. Connecticut has sent on a good many varieties of the strawberry, and for the most part they have reached here in good condition. The list of varieties from that State has been quite large, and the specimens have averaged well up to the standard. One seedling variety from Brocton, N. Y., is worthy of special note. The color is quite ideal, being bright red inside as well as outside; solid and of just the right shape, which is conical, rarely showing any disposition to being furrowed or coxcombed. It is rather soft, so far as can now be judged, but not especially so, and the flavor is more than ordinarily good. Plants that are shown in fruit taken directly from the field, prove that it is very vigorous in growth, and has a large heavy leaf, and the fruit is held up well from the ground on stout stems. It has been named Ryckman, in honor of the introducer.

WEST AND SOUTH.—Idaho has sent the first consignment of a fine display of sweet cherries. Bing is the principal variety shown so far. It is so dark as to be almost black, very large and of the sweetest flavor. It is an excellent shipper, for the flesh is very firm. The Florida fruit exhibit is increasing in interest. The first consignment, of consequence, of pineapples arrived from Orlando. The variety is the Smooth Cayenne, which is the principal variety grown in that region. This is only the beginning of what we confidently expect to be the finest display of pineapples ever shown to the public. This feature of the Florida exhibit will continue to increase until the middle of August, when it will perhaps be at its height. In one of the conservatories is a large bed of pineapple plants transported from Orlando. This exhibit is being made by the Association of Pineapple Growers at Orlando, and they expect to continue it throughout the season, showing just how the pineapples are grown there, and anyone who feels interest in this subject should not fail to see this miniature pinery.

DAIRY AND MUSIC.—The dairy test is being made in the most thorough manner in the Dairy Barn under the direct supervision of E. Van Alstyne of Kinderhook, N. Y. All the principal dairy breeds are represented and in most cases by animals of the highest type. Those interested in dairying should visit this barn when they come to the Exposition, as they will be able to gather considerable information that will be of interest to them. They can see the product and record of each animal up to date. The music on the Exposition grounds is of the very highest order. There is a grand Temple of Music which has a seating capacity of 2,200; the exterior is beautiful in the extreme, both in point of architecture, in color and in design of doorways and other minor features; and on the inside it is almost incomparable in its beauty. The fresco work is very elaborate and extremely pleasing. There is an immense organ on one side and a large stage in front for the various bands which visit the Exposition. The concerts are all free. The music out of doors is in band-stands which are beautifully constructed and conveniently located. Visitors can sit within easy distance of them while listening to the music of such bands as Sousa's, the Mexican Artillery band, the band of the Seventy-first New York regiment, the Thirteenth of Hamilton, Ont., and others, and at the same time enjoy the view of the buildings by daytime, and in the evening be charmed by the glow of lights that bring out the buildings in beautiful relief with the sky as a background. There are also exceptionally fine displays of fireworks at least once a week, and sometimes oftener. These exhibitions are held where they are reflected in all their glory in the lake, which is one of the charming features of the park. Now that the rains have ceased and given the Exposition management an opportunity to complete the work upon the grounds, everything is in fine condition, and those who contemplate coming to the Exposition need have no fear of being disappointed. H. E. VAN DEMAN.

Scales on Maple Trees.

L. E. L., Coventry, Vt.—Will Prof. Slingerland tell us what the trouble is with our maple trees? The twigs all over the trees are covered like those inclosed. I haven't seen any other insects on the trees.

ANS.—The twigs bore a very large and dangerous crop of one of the soft-shelled scale insects, a species of Lecanium. A few years ago a similar scale killed many plum trees in western New York. Upon tipping over one of the large, fat, brown scales, we found it filled with minute white eggs, which will hatch out about July 1 the tiny baby scales. These young scales will crawl on to the leaves and suck out their living, but growing slowly. In the Fall, before the leaves drop, the one-fourth grown scales will migrate on to the bark of the smaller branches and go into hibernation. As soon as growth begins in the Spring, they will begin to suck the sap from the bark, and increase wonderfully in size. Just before they mature, their outer skin hardens, forming a hard brown shell in which the eggs are laid. The best time to fight this pest is during the Winter or early Spring, when the leaves are off. Then the partly grown scales on the bark succumb to thorough work with a whale-oil soap spray (use one pound soap in three gallons water). Usually their enemies soon get the upper hands of these scales.

M. V. SLINGERLAND.

Plant Lice on Plum Trees.

F. E. H., Maywood, Ill.—I send you small flies found on my neighbor's plum trees. Can you tell me name of flies and how to get rid of them? I also send a curled plum leaf; is that the work of the flies, or is it a disease of the tree? I think it the work of flies.

ANS.—The "small flies" were plant-lice, and in sucking their food from the leaves they cause the latter to curl, thus the curled leaves sent result from the work of the lice. In order to kill plant-lice it is necessary to *hit* them with an oil or a soap spray, and this is a difficult thing to accomplish when they are inclosed in a curled leaf. If one has a strong water pressure, turn the hose, with a good nozzle, on the trees about twice a week, and much can be done to stop the work of these little creatures. If possible hit the lice with a spray of whale-oil soap, one pound in five gallons of water.

Ruralisms

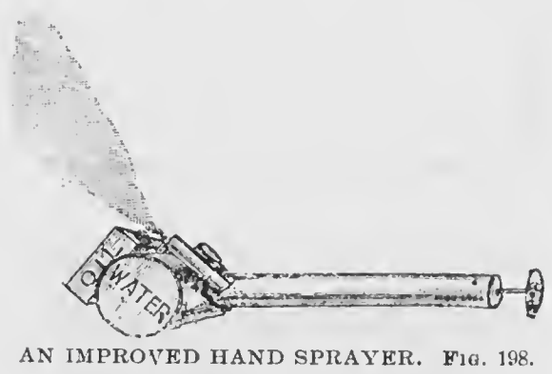
NOTES FROM THE RURAL GROUNDS.

POTATOES LIKE RAIN.—Potatoes have seldom looked better than at the present moment. The cool weather and abundant rains have encouraged a strong growth, and if the soil moisture holds out a fine crop should result. The only exceptions noticed are in very early plantings in undrained soil, where the excess of moisture caused the seed tubers to rot. The worst enemy to the potato as a money crop is neither bugs, blight nor infertile soils, but dry weather. The other pests and deficiencies may be successfully overcome by energy and forethought, but a severe drought at any stage of development will check growth and greatly reduce the yield. Much may be done to modify the effects of a scanty rainfall by industrious cultivation, but the resulting crop does not always pay for the extra effort. With a fair amount of moisture in the soil the intelligent care of a field of potatoes is often better compensated than any other staple crop. The beetles were much delayed by the cool weather, and made their first appearance in a very unobtrusive manner compared with former years, after the earlier plantings began to bloom, and will doubtless be disposed of very easily. There is occasionally too much rain at the ripening period, but during the early stages of growth potatoes like moisture.

AN EXTRAORDINARY NEW COLEUS.—Over 50 species of Coleus are known, all of which are native to tropical Asia and Africa, but the innumerable garden varieties now grown for their brilliantly colored foliage have all descended from C. Blumei, found originally in Java. Some of the old varieties, such as Golden Bedder, brilliant yellow, and Verschaffeltii, velvety crimson, have never been superseded. They always make a brilliant show, and endure dry weather very well. Coleuses are not used as much as formerly, as the taste for carpet bedding is diminishing. They make excellent specimens for the window garden or greenhouse, but have to be renewed frequently by propagation, as old plants become leggy and lose their bright colors. The bloom of these foliage varieties is small and weedy. It is always sheared off as a detriment to the plant unless seeds are wanted. The new species, Coleus thyrsoideus, however, bears large spikes, 10 or 12 inches long, of brilliant blue flowers, just the shade of the much admired Salvia patens, and probably the rarest of all colors. The plant grows well with little more heat than is required for a Pelargonium, and blooms readily in Winter, when blue flowers are especially scarce, few window plants having blooms of that color. It is said to possess a pleasing fragrance which will add to its usefulness if it proves adapted to our climatic conditions. The foliage is not highly colored, but the handsome flowers, lasting in good condition nearly a month, should make it a conspicuous subject for window decoration. Few plants are yet procurable in this county, but it will probably be offered freely next year.

AN IMPROVED HAND SPRAYER.—This has not been a good season for dealers in spraying materials. The almost constant rain and fog has prevented much work of this kind that would be undertaken in an ordinarily dry Spring, greatly limiting the demand for pumps and chemicals. While the weather conditions hindered the development of most insects, many fungus troubles got a good start and various aphides or plant lice seem to have found things about to their liking, and are rapidly overrunning the plants of their selection. One of the handiest little sprayers we have used is the improved Dewey, made by Leggett & Bro., New York, a representation of which is given in Fig. 198. With the chambers filled with kerosene and water respectively it is always ready for instant use and makes a very effective mechanical emulsion spray for soft-bodied insects. The proportion of oil to water can be readily graduated by a valve not shown in the engraving. As made last year the Dewey projected only a horizontal spray, and often failed to reach the under surface of drooping leaves, but now they are caused to direct the spray upward by the very simple expedient of connecting the air compressor with the reservoirs at an angle instead of horizontally, as heretofore.

THE COMBINATION TOMATO.—It is always pleasing to learn that varieties of useful or ornamental plants originating on the Rural Grounds succeed under the conditions of general culture elsewhere. Climate and locality are such important factors in the development of plants that one reads with many misgivings the results of trials in distant places even of the most promising new developments of our experimental work. The Illinois Department of Agriculture has been growing in its new vegetable forcing house about 83 plants of the red tomato Combination, produced six years ago by hybridizing the Dwarf Champion with Lorillard. A most excellent tomato for forcing or field culture under our local conditions resulted. It has been widely disseminated by a Philadelphia seed house, and many flattering reports are



AN IMPROVED HAND SPRAYER. FIG. 198.

constantly received, though it does not meet the requirements of every grower. Even after this lapse of time an occasional plant will bear a dull red fruit like the Champion, though the color should be intense scarlet. This is apparently its only fault. The Illinois experiment reports a yield of this variety as exceeding that expected by most commercial growers. W. V. F.

The York Imperial Apple.

After about 20 years' personal experience with York Imperial, and a number of years' careful observation of its behavior in different counties of the State, I am satisfied that it varies greatly, both as to eating and keeping qualities, according to the section where it is grown. It is not a good apple in the Fall or early Winter either for eating or cooking, but when grown in a location to which it is adopted, and kept in shallow bins in a cool cellar, or better yet, a cave, it comes out in the Spring a fairly good apple for any purpose. It will stand up longer and bear more handling than any of the finer varieties, and coming when all of the strictly high-class varieties are out of the market, it sells well. For this reason the growers of Franklin, Adams, York and some parts of Cumberland County have found it very profitable.

York Imperials grown in my orchard at Harrisburg on the banks of the Susquehanna, about 30 or 40 feet above the level of the river, do not keep any better than Baldwins, they are not salable in the Fall because they will not cook soft, and they ripen up about the holidays, and must be sold in competition with Baldwins and Bellflowers—consequently I have not found them profitable, and would not advise anyone similarly located to plant them. But if I were planting an orchard along the foothills of any of our mountain ranges, on moderately heavy ground, I would certainly plant some York Imperial. I have eaten fine specimens grown on such land in probably half the counties of the State. Wherever it can be grown in perfection—wherever conditions are such as to develop its keeping qualities—it will be found profitable, but it cannot be universally recommended.

Pennsylvania. GABRIEL HIESTER.

Notes from Tennessee.

We are much interested in cow peas, which are as common here as wheat or corn, and have been the principal legume plant for many years. The farmers have been turning their attention to fruit culture of late years, and the result is that the strawberry season closed last week with a record of 50,000 crates for Rhea County, mostly shipped to Cincinnati and other northern cities, netting our shippers an average of over $1 per crate, or $50,000 net for the strawberry crop. Then we have the raspberry and blackberry (growing wild) in abundance; fine-flavored, early peaches are produced in large quantities, and very fine specimens, the first shipment being made last week, the season continuing perhaps for two months. We cultivate the trees generally, but almost every farm is dotted with peach trees of seedling varieties that product good fruit for home use, and sell for about 50 cents per bushel. The Cumberland Mountains give us the best fruit and berries, although coming in later, which extends the strawberry season from about May 10th to last of June for mountain berries. We are ever ready for improvement in culture and care of fruit, and believe this section is an ideal one for the fruit farmer. We have the Tennessee River at our door with its fertile corn land; then the Mission Ridge, which runs from Chattanooga through this county, extending for 75 miles up the river, which is admirally adapted to strawberries and early peaches, and is near the Cincinnati Southern Railroad at all points, making easy shipping facilities. We have had plenty of rain, and wheat is fine and ready to harvest; oats doing well. Corn land was overflowed in river bottoms, and much of it had to be planted over. We sow Whippoorwill peas for hay in this month.

Dayton, Tenn. H. L. R.

Scraps.

OHIO RAIN.—Perhaps it will help the Hope Farm man to know that it has been raining over here in Ohio, and for a few days past the wind has been blowing from the east, so I don't see how we are to send any surplus energy to our Jersey brethren. Of course, there is lots of it going to waste out here, but it's a commodity hard to transfer. With all the rain we have had intervals of fair weather sufficient to get planting done reasonably seasonable, and a fair amount of cultivation done. A wet season makes these hills teem with verdure, and the weary farmer can turn from his weedy cornfield and feast his eyes on the beauty of the everlasting hills—if he's inclined that way.

Ohio. W. L. A.

RETRIBUTION.—A number of years ago a man in this city who, by the most grasping business practices, including oppression of the poor and unfortunate, had gained $100,000, became the victim of a strange mental disease, which took such a hold on him that he was finally put into an asylum, where he died. He thought that he was starving to death, and, to all appearances, suffered the agony of one in that condition. Such cases would seem to show that at times nature brings swift punishment upon those who, by unjust treatment of others, gain wealth or position. In a strictly literal sense this man's "violent dealings came down on his own pate."

Hope Farm Notes

FIELD NOTES.—After 10 days of sun and wind, in spite of all the rain, the soil in the valleys turned dry as a chip. A peculiar thing about our country is the fact that the lower lands are often sandy and warm while the hills are cold and late. The valley people began to suffer for lack of moisture. You could follow the track of a wagon on the lower roads by the dust kicked up by the horses. For weeks and weeks farmers were finding fault because they had too much wet, and here they were calling for more of it. That's pretty good evidence of the futility of human efforts to change the regular order of things. . . . While our friends in the valley were getting ready to growl, our heavier soil was not suffering. The upper surface looked dry, but the light scratch of hoe or cultivator would turn up the dark color that lightens up our hopes in dry weather. On one lower field, which was plowed June 21 for corn and potatoes, the soil was almost too wet for the plow. I feel sure that most of our soil would mature a crop, even though we had not a drop of rain before September. While this is true we were grateful for a lively shower on June 23—just enough to moisten the soil well. . . . The cultivator and weeder have been moving lively in the corn and potatoes. Somehow we have had more use for the weeder this season than ever before, and this extra use has increased our respect for the tool. Our plan has been to use the Acme harrow before the corn came up. This left the surface level and smooth. As soon as the corn began to peek through the weeder was started, first in one direction and then in another. This has been very effective, and our corn is very clean thus far. . . The "Clark" grass was quite disappointing until the Timothy began to head out. It was short and failed to grow properly. All of a sudden the heads shot up, and it is now quite satisfactory, though far short of Mr. Clark's own field.

FRUIT MATTERS.—Apples will be a good crop with us. I thought the wet weather had prevented the fruit from "setting," but in some way the trees have hatched out all they can carry. The constant rains prevented us from spraying, yet so far as I can judge, the fruit is remarkably free from insects or diseases. I believe the general apple crop of the country is short. With the general upset and mix caused by the late, wet season, the early apples ought to be salable this year at fair prices. Many of my best trees are of early varieties—planted by people now long dead. . . . The cherry crop is not very cheering. In spite of the wet the fruit started well, but has dropped badly, and is rotting. The aphis are lunching on the trees and take it all through we cannot brag. My neighbor, an old man, who has lived here many years, says that if we get a full cherry crop once in five years we should be thankful. I thought last year I would show him a thing or two about cherries, but now I am very glad I didn't say a word, for he knew more about it then I did. I do not see any great profit in cherries, but I shall continue to set the trees along the stone walls, for our most vigorous trees are there, and nothing else seems to want to hug a stone wall except wild grapevines, weeds—and the Hope Farm man on Sunday afternoons. . . . Those blueberry bushes which were sent from New Hampshire have made a good start. If they do well I shall plant more of them and try to cover quite a space. The so-called huckleberries which I find growing on our hills are poor things. I hope these imported Yankees will show them how to do their duty. It's pretty hard when a man or huckleberry must be shown what to do in order to fill his proper place in nature!

CHANGE OF PLANS.—It is a good thing to have your work organized and thoroughly planned. That is true, yet I think it is wiser sometimes to break that plan short off when circumstances make it necessary. This year, for example, we tried to make our plans early. We figured it out with care, so that with an ordinary season every tillable acre would be provided with some useful crop. The rains came, and June 10 found us just about where we planned to be by May 15. It was hard to stop, with good soil unplowed and growing up to grass and weeds, but I knew that it was better to take care of what we had in rather than to increase the acreage and half care for all. It was hard to do this, for a farmer hates to see some of his best fields lying idle or worse, yet I reasoned that cultivator, hoe, weeder and mower were more useful than plow and harrow. So we quit planting and went to nursing what we had planted. When our crops are cared for we shall plow again, and the fields now standing still will go into late fodder corn and buckwheat. I wish to try seeding clover and possibly Timothy with buckwheat. I do not know much about the buckwheat crop. I shall use it this year because I have not been able to fit the ground for corn and potatoes, and I want to raise some crop that will return grain or cash without much hand work. The old farmers about us say that buckwheat should go on the poorest fields of the farm. Others say use strong ground or add fertilizer. Who *knows?*

LIVE STOCK NOTES.—The man who bought our little Billy Berkshire has been keeping track of his weight, and he sends the following interesting record:

I herewith give you the weight of little Billy Berkshire, a little boar of my own breeding, cross of Berkshire boar and scrub sow, a little sow same age as Billy out of that litter of five pigs I told you about before; and a little Berkshire sow I bought recently:

	Billy Berk. Lbs.	John York. Lbs.	Scrub sow. Lbs.	B'rk. sow. Lbs.
March	19	20	19	..
May 15	31½	31½	32½	..
May 26	39	40½	42	..
June 1	40½	43½	45½	..
June 13	....	53½	55	37

The two boars are in the same pen and were fed a little extra. The sow is in a pen with 15 more of different size, receiving no extra care; still she is in the lead. So far the cross breeds make a better showing, but of course it is too soon to form an opinion. This is not to say that I am in favor of cross breeds, but it seems they are a little coarser in their make-up. Comparing the two Berkshires with the two scrubs, it is like comparing two race horses with two track horses; you may say blood tells. The two little Berks are a fine pair, and in spite of Billy's being the light weight he is boss in the pen and quite spunky. Next year I am going to experiment a little, whether the pure breeds or the cross breeds are better for the making of pork, making the most weight from farrowing to killing time. C. J.

I am glad to know that Billy is spunky and inclined to be boss of the pen. He had some of Julia's skim-milk to drink, so we should expect him to be a kicker. I would rather have spunk and vigor than weight or pork in the head of the herd. Take our old rooster Don for example. He is not a large bird, and he would hardly be noticed at a poultry show, but he would fight a lion in defence of his wives. Chicks from some high-scoring birds come feebly into the world, and tumble over dead at an east wind. Old Don's sons and daughters have the spirit of their sire. They kick themselves out of the shell, and make the world shell out a good living and a fair start. The size of the sire doesn't count half so much as the spirit. I am told that the father of John L. Sullivan was a little bit of a man. He lacked the size needed to give his son a sound thrashing, yet it was his spirit which enabled the big fellow to whip the best men the world could furnish.

HOUSEHOLD NOTES.—I have heard people joke about country living, and say that farmers eat salt pork and potatoes from one year's end to the other. Sensible people pay little attention to such stuff now, for they know better. The Hope Farmers are not growing dyspeptic over a diet of pork and potatoes. We have eaten strawberries until our noses are red, peas until we are at peace with the world, with turnip, beets, onions to fill out. The fattest of the hens want to sit and we set them right in the oven where they hatch out a fine meal. There are dozens of chicks growing into little balls of fat—just right for the frying pan, and half a dozen roasting pigs all ready to crawl into the hot oven. The cherries are ripe, and they will last until the Red Astrachan apples are ready for baking and sauce! You take one of Aunt Jennie's cherry pies and cover it all out of sight with Julia's thickest cream!! Why, it's enough to make a man forget that he was brought up in the belief that cherries and milk together are poisonous! The Hope Farm man is no confirmed pie-eater, and he has a horror of putting on too much fat, but his plate goes up the second time! I speak of these things to show what an American farmer can put on his table at light cash expense if he wants to. . . . I got home the other night and found the little Graft hobbling about with a sore foot. He had stepped on a little bone and stuck it into the bottom of his foot. I had a close call from lockjaw when I was a boy, and I didn't like the looks of that foot. So we hustled out old Major and carried the Graft and the two little girls to see the old doctor. He bathed the wound with listerine and put a piece of fat pork on it. It was not long before the Graft announced that he could "work his toes" and he celebrated this condition by eating a big supper. This is one of the dangers of "going barefoot," still, we think it a good thing for the children to "shed their shoes" in Summer. H. W. C.

A Costly Breakfast.

The Washington Star tells of a scientific man who was hunting in the Rocky Mountains for specimens for the Smithsonian Institute. He was particularly anxious to get eggs of a certain rare variety of partridges, and was prepared to pay an enormous price for them if necessary. One morning he ran across a miner who had just been cooking his breakfast, and on the ground the scientist saw shells of the very eggs he was after. The miner had eaten six of them, and he turned pale when the professor told him that he would gladly have paid $100 apiece for the eggs. The thought that he had eaten a $600 breakfast was maddening, but the miner believed they could find more of these eggs, as he had found this nest without looking for it at all. They hunted together for a week, but with no success, and the professor finally got some himself 100 miles from that place. Several years after he got a letter from the miner, who was still in Colorado, and said that that $600 breakfast had taken away his appetite for eggs to such an extent that he had not been able to eat any since. Most people who buy anything at an extravagant price do not realize it until later, and those who laugh at this miner's expensive mistake may be more than duplicating his blunder in other ways. How about a man who to get carriages, costly machinery or furniture that he does not need, fastens on his farm a mortgage that through poor crops or other misfortunes grows until it eats up the farm and turns him out of doors? Or what about people who through dissipation chop off 25 years from their lives?

WHERE LIBERTY ENDS.—Rev. Louis A. Banks, of New York, in speaking of faith healers of various types who refuse to have medical attendance for any of their family who are ill, says that one has a right to believe anything he pleases, no matter how ridiculous or foolish; but just as soon as he carries that belief to such an extent that the health or lives of others are in peril, the law should step in and stop him. As an illustration he told of an absent-minded man who was walking along the street talking to himself and emphasizing his conversation by flourishing an umbrella recklessly. Finally he hit a passerby on the nose with it, and the man at once knocked him down. The absent-minded party was very indignant, and wished to know if this was not a free country. "Yes," replied the other, "this is a free country, but your liberty to flourish that umbrella ends where my nose begins."

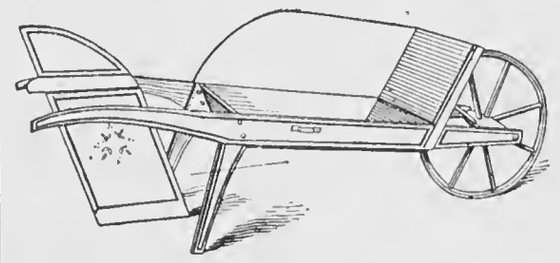
How to Drain Land Profitably.

On every farm there is probably some land that could be made more productive by underdrainage. Properly drained land can always be worked earlier, and more profitably. The best and most economical way to drain is explained in the book, "Benefits of Drainage and How to Drain," which is sent *free* by JOHN H. JACKSON,
76 Third Avenue, Albany, N Y

WHEEL BARROWS.

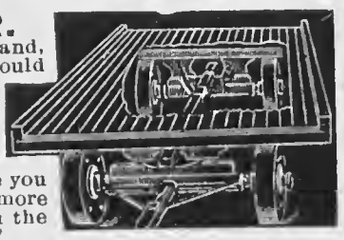


Flat hickory spoke, 22-inch wheels, shrunk steel tires, one inch wide. Strong enough for heaviest load, light enough for the boy's use; nicely painted, and an ornament to your premises. Price $3.50, direct from factory. Hickory spoke wheels alone, fully ironed, $1.25 each. The boys can make the bodies on rainy days. DON A. GILBERT & CO., Bainbridge, N.Y.

STEEL WHEELS for your FARM WAGONS

any size wanted, any width of tire. Hubs to fit any axle. No blacksmith's bills to pay. No tires to reset. Fit your old wagon with low steel wheels with wide tires at low price. Our catalogue tells you how to do it. Address
EMPIRE MFG. CO., Quincy, Ill.

A LETTER.



"I cannot understand, why any farmer would spend his money for a high-wheeled wagon, when he can get a Farmers Handy for so little money. I can assure you that there will be no more sky scrapers used on the Beatty Fruit Farm."
FRANK E. BEATTY, Covington, Ind.
FARMERS HANDY WAGON CO., Saginaw, Mich.

ROSS ENSILAGE CUTTERS
Furnished with BLOWER or CARRIER, as desired.
GUARANTEED to be the BEST.

JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, JULY 6, 1901.

WE have had many questions about cranberries and their culture. Some people with low, swampy land seem to think there is money in growing this tart and spicy fruit. There is a lack of practical information on the subject, and we have arranged for a series of articles which will, we hope, tell the story. Questions will be welcomed from those who do not find in these articles what they wish to know.

*

A NEW and strange disease has broken out among city horses. Over 15,000 horses in this city alone are reported sick. It is said to be a germ disease, and spreads rapidly. The cold, wet Spring was too much for many of these horses. They were kept hard at work, though drenched with cold rains day after day. The disease is likely to end in pneumonia unless carefully watched. It has not yet been troublesome in the country—where horses are not crowded together and on the whole are kept under better sanitary conditions. In view of the fearful sickness here there is all the more reason why farm horses should be well cared for.

*

WE observe that trade papers and other interested parties are already beginning to talk "big crop" when discussing the apple prospect. Their object evidently is to make eastern growers believe that the western crop is very large—with more than enough surplus to overcome the evident shortage in the East. From all that we can learn the western crop, while larger than last year, will be less than the average. At the same time it is too early yet to tell accurately about it. The Government report puts the fruit crop of New York State at 75 per cent of an average. That seems little short of ridiculous in view of the facts and is little more than a guess at conditions.

*

PULLING a mower through heavy grass in the broiling sun is about as hard work as a farmer can ask his team to do, and the discomfort of the horses is increased by the bites of savage flies, which swarm at this season of the year. We have seen men work their teams before the mower until the poor animals were covered with foam, and nearly wild through the annoyance of flies. This might be avoided by stopping now and then when facing the wind, lifting the collars and giving the hot shoulders a chance to cool; and a slight investment in some effective fly killer would be an act of kindness to the horses, which have but little chance to fight the fly pest when in the harness.

*

THE authorities have issued a fraud order against "Watson & Co." of this city. This so-called firm advertised in country newspapers, offering loans on real estate. Hundreds of country people with useless farm property jumped at the chance to obtain ready money on it. They were first met with a demand for "brokerage fees" which were $20 or more. Then there was a demand for money to pay for searching the title and later, another for additional expenses. Strange to say there were many who made all these payments. They were put off on one excuse after another, until finally they were informed that the loan could not be made after all! It cannot be found that a single loan was ever made by the so-called "firm," though they must have taken in hundreds of dollars in fees. This is a fair sample of the rogues who prosper at the expense of country people. A farmer once said about such a man: "He must be all right, for his office is on Broadway—the great business street of New York." The man he referred to simply had a post office box at a small cigar store and spent most of his time in a saloon. After all the warning that has been printed we find it hard to raise much sympathy for one who sends money to such rogues.

*

THERE seems to be no doubt about the fact that the general quality of the milk shipped to this market has improved during the past few years. It is cleaner, and better cared for and cooled before it leaves the farms. There are a number of reasons for this. People know more about milk and its needs than they used to. The scientific men have taught us a good deal about germs and bacteria, and we understand more of the importance of keeping them out of the pan and can. It is also true that the Five States Milk Producers' Association has been influential in providing better milk. Any organization for business purposes in these days is sure to teach the people the necessity of putting pure, wholesome food on the market if they hope to command respect. That is one of the great advantages of coöperation among farmers, and the milk producers are learning it.

*

WHAT are the requirements as to mail boxes under free rural mail delivery? The Post Office Department requires that such boxes be uniform on all routes established hereafter. The Department offers a list of 14 different styles of boxes. This plan is to have patrons along a proposed route decide by vote or otherwise which of these 14 boxes they prefer. This having been decided the boxes must be uniform—all of the type agreed upon. On routes which were started before March 28 any suitable box is permitted, but as such boxes become unfit they will be condemned and must be replaced by one of the 14 mentioned. The boxes which are endorsed by the Department will be entitled to the protection of the United States Statutes, which will mean much to the owners. We see no fair objection to this plan of securing uniform boxes of approved shape and size.

*

A MEMBER of the Wisconsin Legislature proposes that the State establish a steam laundry at every cross-roads, to which the farmers' washing and ironing may be brought each week. As Wisconsin is pretty well covered with creameries and cheese factories there is in many places abundant power to operate such public laundries, and the idea is more practical than it at first appears. Free mail delivery and the telephone promise much in the way of relief from the monotony of country life, but the possibility of lifting the drudgery of the weekly wash from the farmer's wife should deserve the most earnest consideration. Much has been done to lighten the physical labors of the farmer in the way of riding tools and coöperative methods of harvesting bulky crops, but with the sole exception of relief from the care of dairy products in the creamery and milk shipping districts, the toils of the farm wife are as exacting as in past generations. Whether immediate practical action is taken on this progressive idea or not, the discussion of its possibilities will do much to familiarize the public with the need of lightening the toil of the most deserving class of the entire population of our country.

*

THE daily papers have had much to say about the so-called "Platt amendment," and its acceptance by the Cubans. Comparatively few Americans know what this amendment is. Most people are ready to leave such things to the Administration and go about their own business until "hard times" shall once more turn them into unfair critics or stiff-necked partisans. In a general way people understand that the Cubans will receive a measure of political independence, but there are other things on the island which are even more important. They are more important because they deal with the development of human character, without which independence will prove a mere mockery. Mr. Hubbard refers to one of these things on page 466. When the war ended Cuba was filled with orphan or deserted children. In the single Province of Matanzas, out of a population of 190,000, there were 33,000 widows and 32,000 little ones left without father or mother. This was but a part of the awful sacrifice which Cubans made for liberty. Many of these little ones starved to death, while others lived like little savages on roots or wastes. Of what value will independence be to Cuba if the future Cubans are to be brought up in this fashion? The Platt amendment may be all very well, but there are other things on the Cuban platter that should be amended also. Mr. Hubbard and others like him are facing this problem bravely, and doing their best with limited funds. Many of these homeless children have been sent to this country, and have found homes here. Others are fitting themselves for citizenship in their native land. The parents of these children died for liberty. It is the duty of Americans to see that the offering was not made in vain.

QUICK sales are necessary in the perishable fruit trade during hot weather. Sometimes produce is too ripe when shipped, stands too long in the sun at shipping stations, or is delayed in transit, and gets here just on the verge of decay. In such cases the dealer often has to decide between selling it at once at a cut price, and letting it go to the garbage barrel. Of course the former plan is always the better, and those who have a regular commission merchant who has dealt squarely with them will be wise to leave such matters entirely to his judgment. Unfortunately there are unscrupulous dealers who let stuff spoil on their hands through neglect or careless handling, and too often the farmer has a just cause for complaint. A man guilty of wilful neglect in handling the goods of another is amenable to the law, if the complainant can prove his case, which is usually difficult, as he is not here, and does not know anything about it until the damage is done, while the receiver can lay it to anything but his own neglect.

*

A FEW weeks since we referred to a manufacturer who attempted to deceive the public by misquoting an endorsement. A scientist wrote a report of his experiments with a moth trap. He said it was effective against a few insects, but worthless in fighting others more dangerous. The manufacturer cut out all qualifying statements and made the report read as though the scientist endorsed the trap without any reserve. A somewhat similar case is reported from California. The laws of that State require two restrictions to the sale of Paris-green. It must contain at least 50 per cent of arsenous oxide, and not over four per cent of this shall be in a free or soluble form. The object of this is to prevent the sale of Paris-green which would burn or scald the foliage. A manufacturer sent a sample of his "green" to the Experiment Station for analysis. It contained the proper amount of arsenous oxide, but nearly 17 per cent of it was free. This was four times the amount permitted by law, yet the manufacturer said nothing about it. He used as much of the analysis as he thought would suit him, and cut out the rest! Much of this work is done because the manufacturer or dealer thinks the man he quotes will not bother about correcting a small thing. Therefore they carve or stretch the truth to suit themselves. The men who are misquoted in this way should make it their business to see that such things are righted!

*

BREVITIES.

I saw a little child play in the sand,
And try to fill his box with fistfuls small.
It ran like water through his chubby hand,
His little fingers could not hold it all.
And then, with childish petulance he threw
His pail of water on the hateful sand.
When, lo! it took on strength and purpose new;
He held it safely in his little hand.

I thought how often we reach out for things
That lack cohesion, order, unity.
And, like the sand, no record ever clings
To show our work and prove our constancy.
Until almost by accident we throw
Water upon the bright, elusive sand,
And, strange to say, we feel life's purpose grow
Into firm character within our hand.
Sand is the dry, hard, grinding toil that burns
The brand of drudgery upon the clod,
Water the love, ambition, faith, that turns
The child of toil to lift his eyes to God.

HOW the corn is jumping!

VIRTUE is the antidote for vice.

A HOT wind winds up the weeds.

READ Mr. Van Deman's Exposition notes.

A QUESTION is wise or foolish according to the spirit in which you ask it.

A FRENCH automobile has covered five miles in four minutes and 44 seconds.

HAVE you not found graded stock on the whole more vigorous than pure bloods?

ALL who have tried Mr. Clark's method of grass culture please stand up and report.

THE leaves of Alfalfa are strong in protein. Cut and cure the plant so as to save them.

ANKYLOSTOMIASIS is the name for a new disease, or rather a rare old one. We are glad it is rare.

MR. LEWIS says he has had three maximum crops of potatoes in 20 years. Can you beat that? If so, how was it done?

"FRENCH bitters"—a good name for Paris-green. Some "bitters" designed for human consumption are slower but nearly as sure!

THE Kansas Experiment Station suggests dried blood as a calf tonic. Pure blood may answer, but some of the cheaper grades used for fertilizing will not do.

MISSISSIPPI has a State university and an agricultural college. There is hope in the report that the university had 150 students, while the agricultural school had 500!

DURING the past few days we have received a good many letters asking just how to make the Bordeaux Mixture. Every experiment station in the country has given this information time and again, and it has also appeared in many pamphlets and catalogues. Whose fault is it if any intelligent man fails to know how to prepare the Mixture?

Events of the Week.

DOMESTIC.—Justice Bradley, in the Equity Court in Washington, June 21, denied the application of Lone Wolf and other Indians for an injunction against the Secretary of War, to restrain him from opening the Kiowa, Comanche and Apache lands, in Oklahoma, to settlement. He held that the question was purely a political one, with which the Court had no power to deal. An appeal was taken. . . . . Three persons were killed and several injured during an electric storm which swept over Indiana June 20. At Greentown trees were uprooted and crops badly damaged by hail, the loss being put at $40,000. At Hartford City 50 oil derricks were blown down, and several buildings damaged; loss $25,000. . . . . A fire following an explosion of fireworks in a store at Paterson, N. J., June 21, caused the death of 18 persons, and injuries to many others. . . . . Adelbert S. Hay, son of Secretary of State Hay, fell from a window in the fourth story of a hotel at New Haven, Conn., June 22, and was instantly killed. Mr. Hay was 25 years old. In May, 1900, he was appointed United States Consul at Pretoria, South Africa, returning to this country last March. Had he lived two days longer he would have been appointed assistant secretary to the President. . . . . A great flood swept down the Elkhorn River Valley, West Virginia, June 23, as the result of a cloudburst. The resulting devastation reached a length of 35 miles, a dozen small towns being destroyed, and nearly a score of coal mines wrecked. The property loss will be about half a million, and 60 lives or more were lost. Full details have been received very slowly, communication being destroyed. . . . . By a storm around Pittsburg, Pa., June 22, four lives were lost, and a property damage of $500,000 was sustained. . . . . A fire which started in a brush factory at Newark, N. J., June 22, caused a loss of $160,000. . . . . Ten new cases of smallpox were reported in Brooklyn, N. Y., June 25, and the disease continues to appear all through Greater New York.

PHILIPPINES.—Civil government will be established in the Philippine Islands on July 4, Judge Taft becoming Civil Governor. General Chaffee has been appointed Military Governor.

GENERAL FOREIGN NEWS.—Light on the recent campaign in China of the allied forces is furnished by the report of General Chaffee, the American commander, made to the War Department. Among other things, it tells of looting and killing by the soldiers, the victims slain including women and children. For every Boxer killed he estimates that 50 harmless persons were slain. Cities, towns and country were plundered. . . . . During the week ending June 22 there were 155 new cases and 152 deaths from plague at Hongkong.

FARM AND GARDEN.—Henry Xavier, well known as an expert on winemaking grapes, died at Mt. Vernon, N. Y., June 19, aged 75. He was a native of Lyons, France, coming to this country when young. He made many trips to Europe in connection with the introduction of wine-producing grapevines into this country. He brought, all told, 842 varieties, practically every known species from Italy, France, Spain, Germany, Hungary, and other vine growing countries. He conducted many experiments and produced many crosses which have proved successful in the wine producing regions of America.

The following dates have been arranged for special exhibitions at the Pan-American Exposition: Hardy roses, June 18 to 28; sweet peas, July 23 to August 2; Gladiolus, August 6 to 17; Asters, August 27 to September 7; Dahlias, September 17 to 27; Chrysanthemums, October 22 to 31.

The Nurserymen's Mutual Protective Association held its annual meeting June 12, and reëlected the following officers: President, N. H. Albaugh, Phoneton, O.; vice-president, Wm. C. Barry, Rochester, N. Y.; secretary-treasurer, George C. Seager, Rochester, N. Y. Executive committee, E. Albertson, Bridgeport, Ind.; Irving Rouse, Rochester, F. Stannard, Ottawa, Can. On the same date the American Nurserymen's Protective Association held a meeting when the following officers were chosen: Wm. Pitkins, Rochester, president; A. L. Brooke, North Topeka, Kan., vice-president; T. B. Meehan, Germantown, Pa., secretary; Peter Youngers, Geneva, Neb., treasurer. Executive committee, Messrs. C. J. Brown and Wm. Pitkin, of Rochester, N. Y., and J. H. Dayton, Painesville, O.

At the recent meeting of the Florida State Horticultural Society, Tampa was selected as the next place of meeting, and the old officers were elected, with exception of third vice-president: President, George L. Taber, Glen St. Mary; vice-presidents, Dr. George Kerr, Pierson, G. W. Wailson, Jacksonville; W. A. Cooper, Orlando; secretary, S. Powers, Jacksonville; treasurer, W. S. Hart, Hawks Park.

At the recent convention of the American Association of Nurserymen, at Niagara Falls, N. Y., the transportation committee reported having obtained a reduction in the southern freight rates of from 25 to 50 per cent. Irving Rouse reported on behalf of tariff committee that special efforts should be made to secure fairer appraisements at ports of entry. C. L. Watrous, chairman of the legislative committee, gave details of efforts of that committee to ward off inimical legislation. Officers were elected as follows: President, Robert C. Berckmans, Augusta, Ga.; vice-president, R. J. Coe, Fort Atkinson, Wis.; secretary, Geo. C. Seager, Rochester, N. Y.; treasurer, Charles L. Yates, Rochester, N. Y.; executive committee, Peter Youngers, Nebraska; M. W. Hale, Knoxville, Tenn.; William Pitkins, Rochester, N. Y. Next place of meeting Milwaukee. Resolutions were passed condemning proposed free distribution of nursery stock by the Federal Government and asking legislative committee to use its influence to combat the proposed action.

Since the New York State Fair prize list was printed the Short-horn Breeders' Association of America offers to duplicate all premiums offered by the New York State Fair Commission, which makes this class amount to $1,085.

At a joint meeting of State engineers and Senators and Representatives of western States held at Cheyenne, Wyo., a bill was prepared by a committee embodying a scheme for Government aid in the reclamation of the arid region. A meeting of the delegations of the Western States in Congress is to be held in Washington just prior to the next session of Congress, when this bill will be considered for introduction and a plan of action decided upon to secure its passage. The proposed measure, in part, is as follows: "That all money received from the sale or disposal of public lands in Arizona, California, Colorado, Idaho, Utah, Montana, Wyoming, Kansas, Nebraska, Nevada, New Mexico, North Dakota, Oregon, South Dakota and Washington, beginning with the fiscal year ending June 30, 1902, shall be reserved for the benefit of the State or Territory in which said lands are sold, to be kept as a special fund, known as the 'arid land reclamation fund,' under the direction of the Secretary of the Interior. Each State shall maintain an engineer's office, who shall plan and make the estimate for the reservoirs. The plans shall be submitted to the Secretary of the Interior, who may approve or reject them. If approved the Secretary shall set aside money for their construction and such lands are to be exempt from entry. The State may sell the completed works to actual users of water."

The Government has dismissed the criminal prosecution brought at Kansas City a month ago against officers of the Harrison Butterine Company, on a charge of violating the revenue laws.

The Pennsylvania Senate has confirmed the reappointments of Secretary of Agriculture Hamilton and Dairy and Food Commissioner Cope.

The Mississippi Valley Apple Growers' Association met at Quincy, Ill., June 20. The meeting was unusually well attended and was presided over by Henry Clay Cupp, of Fall Creek. James Handly, of Quincy, served as secretary. In the immediate vicinity of Quincy it was the consensus of opinion that there would be but 50 per cent of a full crop. If this result should be reached, the crop will be twice as large as that of last year. This estimate is made in the face of the fact that in several localities the trees are bare, and in others not more than 10 or 15 per cent of the crop can be expected. In other localities in this district there is an assurance of full 75 per cent of a crop. Jefferson County reports it will have 60 per cent of a crop. It is noticeable that failure of the crops is confined chiefly to the old orchards, which is an indication that the younger orchards are receiving more intelligent care and attention. In the southern part of Illinois the crop is more promising than in the central portion. In Franklin County the crop is unusually heavy. Isaac D. Snedecker, of Jerseyville, furnished a very interesting paper on "Spraying." Daniel Shank, of Clayton, read an instructive paper on the "Propagation of the Ben Davis Apple." Dr. C. W. Rook, of Quincy, favored the meeting with a timely talk on "Roots of Trees."

CROP PROSPECTS.

Wheat very poor, hay good, beans looking well, oats and corn good; apples mostly fallen off. C. D. A.
Chelsea, Mich.

Rains came too late for oats and potatoes. Wheat will be short, and some thrashing outfits are being shipped out for work in other counties. B.
Neosha Co., Kan.

The apple crop will not be over 10 per cent, owing to rains and cool weather at blooming time. The potato crop will be large and very fine in this section, barring future contingencies. J. L. B.
Norfolk, Va.

The majority of No. 6 white wheat is hardly worth harvesting. The fields look as though one had sown chess rather than wheat. A new wheat, Golden Chaff by name, has been grown by a few farmers near here, which appears to stand up against the fly. I have 10 acres rye which stands up well. One cannot be seen in the field, it is so high, put on for a cover crop but could not plow it under this Spring. When I read of your experience broadcasting fertilizers, I smiled to think one would try it that way. It was only yesterday, however, that I was disappointed in getting a drill for that purpose, and four men waiting to plant potatoes. Well, we sowed fertilizer broadcast. I can now sympathize with you; at that time I did not. C. H. C.
Jeddo, N. Y.

The outlook for the hay crop in the major portion of the country is unusually good. Probably it will be very heavy in most sections. The trade in haying tools has been larger than usual. This seems more marked, as the trade in haying tools was not good the previous year. The haying tools which we manufacture are mowing machines, rakes and tedders. The improvements in haying machinery during the last few years have not consisted to any great extent in radical changes in design, but in a closer study of the machine, resulting in improving materially various parts. Roller bearings have been introduced. There was a call for mowers of wider cut, and for wider hay rakes, and while this was carried to an extreme the trade seems to have settled back somewhat to take a bar six inches or a foot wider than was once considered standard. Judging from the demand for tedders this year, we should say that they are being used more than ever before, especially in the older States. It is our opinion that the hay crop will be very large this year, which is a fortunate thing, owing to the great scarcity of hay in the country.
JOHNSTON HARVESTER CO.

JUNE 24.—Apple outlook in this and surrounding counties is very discouraging. Practically no Baldwins, few R. I. Greenings, Ben Davis and Russets. Pears will be light crop. Peaches badly affected with curl-leaf. Large commercial growers are very despondent over the situation. Rot is showing on grapes, one-half crop peaches, and fair crop prunes only. This is emphatically an "off" year, but we hope for better ones. E. W. C.
Wayne Co., N. Y.

JUNE 24.—The prospects are that there will be few apples in this vicinity. The cold late Spring and late frost have damaged the crops. I think I shall have less than one-half usual yield. I had to drag up my corn ground and sow it to oats and peas; corn rotted in the hill. My oats and peas were not sown until June. The ground was so wet I could not work it. Horses would be knee-deep in mud, and this on ground where I had potatoes last year. Hay is good on new meadows and not so good as some suppose on old ones. Grass tall, but thin. Yellow clover is coming into our meadows and pastures. We cannot account for it. Stock like it. What is its feeding value? S. C. A.
Warren Co., N. Y.

Government Crop Report.

The temperature for the past week has been generally favorable for growing crops, with the exception of the Rocky Mountain region and parts of the Pacific coast, where it was abnormally cool. Corn conditions are greatly improved, but in southern Missouri and Texas rain is needed. Cultivation is progressing rapidly in the Middle and Eastern States, where the previous rains gave the weeds a great start. Winter wheat harvest is in full blast. Fly is doing damage to the standing crop in parts of Michigan, Pennsylvania and New York, and rust is reported in Ohio and Virginia. The outlook in the Spring wheat region is favorable and the crop is now heading out. Haying is under way in most of the Northern States. The crop is lighter than usual in parts of Ohio, Maryland, Missouri and Mississippi. Oats in the Ohio Valley and Middle Atlantic States look promising. Cotton in the central parts of the belt has improved, but in the eastern section the fields are very grassy and some have been abandoned. More favorable reports on apples are received from Ohio, Indiana, Illinois and Kansas, but in the other principal apple States, the outlook is not so good. In the Maine potato section bugs are very active, and the sweet potato flea is doing destructive work in southern Jersey.

Stock in Sprayed Orchard.

I have never known a case of live stock being killed when allowed to run in an orchard where spraying was being done, except chickens. We kept some chickens last year confined under plum trees which we sprayed. There was no grass under the trees, but a few weeds, particularly shepherd's purse. The chickens having no green stuff to eat except this shepherd's purse probably ate more freely of it than they would have done otherwise, and a few were killed. I have heard of one other such case as this. I have never known, however, of any cattle, sheep, horses or hogs being killed, although we have allowed them to run in the orchard during the time of spraying. We have even noticed that the animals seemed to like to follow the sprayer around and eat the damp grass when it is covered with the poisonous mixture, but none has ever been killed. I have expected an accident of this kind, because it often happens in our spraying that the hose becomes loosened from the pipe, or bursts, and considerable quantities of liquid run out on the grass. In order to make a thorough test of the matter we have kept stock in the orchard purposely, during all the time of spraying, and I think now that there is no danger, unless stock should get at the mixture and drink it, which would not be likely.
Ohio Exp. Station. [Prof.] W. J. GREEN.

FRUIT NOTES.—An improvement is noted in the quality of strawberries. Some from the Oswego district are selling at a premium above quotations, and all grades are in better demand than last week. Better peaches are also arriving, but they are still unsatisfactory, and buyers are waiting for fancy grades. Watermelons are coming in at the rate of 10 or 12 cars a day. The quality is excellent and they are bringing good prices. There is an excessive supply of cherries, especially under grades, and any reasonable offer is accepted for such lots. A few southern plums are seen, but they do not sell well, preference being given to the Californias, which are larger and put up in more attractive shape. There is a good call for prime muskmelons, but the bulk of the receipts are of miserable quality. Business in bush fruits is dull, and gooseberries hard to sell.

NEW YORK FRUIT GROWERS.—Wayne County is the banner county in the New York State Fruit Grower's Association, having 49 members. At a recent meeting of the Wayne Pomona Grange Hon. L. T. Yeomans, president of the New York State Fruit Growers' Association, gave a very interesting talk on "Why do the Fruit Growers Organize?" He spoke mainly along the line of protection and coöperation, and cited as examples the organizations of California and Delaware. He mentioned the crop report of the Department of Agriculture, and criticised its estimate, which is 76 per cent for New York State, whereas the sources of information of the Association would not place the estimate over half that amount. The estimate from a number of growers present placed the prospect for Wayne County at about 25 per cent. A great meeting of farmers and fruit growers is planned for August 19 at the farm of B. J. Case, Sodus, N. Y. C. E. C.

CALIFORNIA PROSPECTS.—After nearly three months of almost rainless weather, the last day of April and the first part of May gave Santa Barbara County and most of southern California a rainfall of from 1¼ to nearly four inches which, with two weeks of rather moist cool weather, caused a large part of of the grain fields to take a new start, so that even where failure was anticipated, a good crop of hay and grain will be harvested. Much of the land designed for corn and beans was put in better trim for planting, so we have a brighter prospect along that line. Deciduous fruits are not promising well, so I think the result a short crop. Much of the fruit-bearing wood is still dormant, which may start during the month of June. Lemons promise well and many have been and are being gathered, stored and sent to market. Oranges are ripe and luscious. This county does not grow enough for home use, so there is more or less shipped in from orchards further east and south, where there are plenty and to spare. Walnuts promise fairly well. Much of the best land is planted with beans, mostly Limas. Many of the garden varieties are grown for the eastern seedsmen on contract. The seedsmen furnish seed and pay so much per 100 pounds for the crop f. o. b. on cars or steamers. The rainfall has not been sufficient to wet thoroughly and deep, but we are looking for better crops than for two years past. All will irrigate so far as the water can be obtained. Water is still being developed, and new plants are being made ready for irrigation. O. N. C.
Santa Barbara Co., Cal.

Woman and Home

From Day to Day.

KEEP A-GOIN'!

If you strike a thorn or rose,
Keep a-goin'!
If it hails or if it snows,
Keep a-goin'!
'Taint no use to sit and whine,
When the fish ain't on your line;
Bait your hook and keep on tryin'—
Keep a-goin'!

When the weather kills your crop,
Keep a-goin'!
When you tumble from the top,
Keep a-goin'!
S'pose you're out o' every dime?
Gettin' broke ain't any crime;
Tell the world you're feelin' prime!
Keep a-goin'!

When it looks like all is up,
Keep a-goin'!
Drain the sweetness from the cup,
Keep a-goin'!
See the wild birds on the wing!
Hear the bells that sweetly ring!
When you feel like singin'—sing!
Keep a-goin'!
—Atlanta Constitution.

*

A CHERRY stoner only costs five cents, and is certainly worth much more in saving trouble. It is a doubled wire with a wooden handle. The wire is bent a little at the end; this is thrust into the fruit at the stem opening, the spoon-like stoner slipped in, and the stone removed with little loss of flesh.

*

A MEMBER of the Wisconsin Legislature, F. J. Frost by name, will go down to posterity as the first lawmaker who ever tried to lessen the drudgery of the farm housewife. He wants a steam laundry established at every cross-roads in the State, where farmers' wives may bring their weekly washing, and thus save themselves one of their hardest duties. The legislator believes a steam laundry could easily be operated in connection with each creamery and cheese factory. He has not developed any definite plan yet for the establishment and maintenance of the laundries, but believes that it may be done.

*

FOUNDATIONS for ribbon stocks are now sold in several styles. One, which costs 25 cents, consists of a collar of coarse canvas having a pocket inside of the front, in which a perforated piece of celluloid is run. A cheaper one, quite as satisfactory, and much cooler, is of stiffened muslin kept in place by six flat wires like whalebone casings. The little turnover collars of lace or embroidery are basted in place on this foundation, and the ribbon twisted around and slipped under the turnover when the foundation is adjusted. Broad soft turnover collars of hemstitched lawn are seen on many new shirt waists, in place of the stiff linen.

*

PACKING trunks is now a profession, and the work of the professional is worth studying for one's own instruction. It is troublesome, but it is better to spend a little extra time in packing than a great deal in pressing out obstinate wrinkles afterwards. To fold a skirt, do not turn it inside out and do not bring a crease down the middle of the front. Bring the center of the front and the center of the back together, the creases at the sides; arrange the folds in the back, and if necessary fold back from the sides. Fold over once horizontally, putting a little tissue paper in the folds; the result is that there are no creases in the front. In folding coats or waists, lay them back down, right side out; bring the fronts together. Tuck a little soft tissue paper into the tops of the sleeves, not enough to round them out too much, but enough to prevent creases. Any trimmings likely to become creased should be filled out with tissue paper. The sleeves are brought forward, and bent once at the elbow; if any further horizontal folding is required, it should be done below the waist line, so as to avoid creasing. Skirts and waists are held in place in the trunk by tapes tacked at the sides and ends, and tied across. Shoes are wrapped in tissue paper and tied together. They should be kept in a tray with other solid articles, and not distributed through the

3844 Child's Dress.
2 to 8 years.

garments. Hats are usually held in place by tapes across the compartment devoted to them, but some of the new trunks have cloth-covered frames to which the hat is pinned firmly. Efforts to save space in packing hats are likely to be disastrous.

*

HANDKERCHIEFS of silk gauze 45 inches square, in all sorts of bright and delicate colors, are offered for $1.25; they are used to trim outing hats of Panama or straw braid, and are very light and summery. By another year we are likely to see a great many Panama hats for women; their lightness and durability are making them very popular, and it is not likely that their use will be confined to men. Porto Rican palm-leaf hats are now freely offered, and are inexpensive. We can hardly consider the fine Panama hats expensive, when their wearing qualities are considered; we heard recently of a man who paid $30 for one of these hats, 15 years ago; he has worn it every season since, and was recently offered $15 for it by a dealer. He expects, however, to wear it for another 15 years at least.

The Rural Patterns.

The child's dress shown has the French effect of long waist and short skirt. The long waist is made over a body lining that fits smoothly, without being tight. On it is faced the round yoke, and over the lower part are arranged the full portions of the waist proper, and to the lower edge is attached the straight full skirt, which in this instance is made of flouncing. The sleeves are simply full, in guimpe style, and, as shown, the lining is cut away beneath the yoke, but this last is entirely optional. Over the seam which forms the skirt to the waist are arranged a succession of straps or bands beneath which the silk ribbon sash is passed, and which serve to keep it in place. To cut this dress for a girl four years of age, 3½ yards of material 21 inches wide, 2¾ yards 32 inches wide, or 2¼ yards 44 inches wide, will be required, with ¼ yard of all-over tucking for yoke; or 1⅜ yard of plain material 32 inches wide, 2⅛ yards of flouncing 13 inches wide for skirt, 1¼ yard of embroidered frills, ¼ yard of inserted tucking, and ¾ yard of insertion, to make as illustrated. The pattern No. 3844 is cut in sizes for children, 2, 4, 6 and 8 years of age; price 10 cents.

The kimona dressing sacque will be found very comfortable in warm weather. The original is made from Japanese cotton crape with a band of plain colored Japanese silk, but flowered muslins and dimities are pretty for warm days. French and Scotch flannel and flannelette are excellent for cooler weather, and still handsomer sacques can be made of figured oriental or foulard silks. The yoke is perfectly smooth and extends over the shoulders at the front. The skirt portion is simply gathered and seamed to its lower edge, while a band extends round the entire garment, making a finish. The sleeves are loose and flowing, with a slight fullness at the shoulders. To cut this kimona for a woman of medium size, four yards of material 21 inches wide, three yards 27 inches wide, or 2¾ yards 32 inches wide will be required, with 1¾ yard in any width for bands. The pattern No. 3839 is cut in three sizes—small, medium and large; price 10 cents from this office.

The wrapper or lounging robe shown is also a comfort on hot days. It is loose and unlined, with Watteau back. The sleeves are cut in one piece and extend to the elbows only, where they terminate in becoming frills. At the neck is a big ornamental collar which is held by ribbon ties beneath the chin. To cut this wrapper for a woman of medium size, 10 yards of material 27 inches wide, nine yards 32 inches wide, or 5⅞ yards 44 inches wide, will be required, with frill at lower edge 8½ yards 27 inches wide, 7¾ yards 32 inches wide without frill. The pattern No. 3824 is cut in sizes for a 32, 34, 36, 38, 40 and 42-inch bust measure; price 10 cents.

Sam Griggs's Carrier Hens.

UNCLE SILE TELLS THE STORY OF HIS BROTHER-IN-LAW'S SUCCESSFUL EXPERIMENT.

"Less see," remarked Uncle Sile, as he settled himself in a new position on a box in front of the store, "Did I ever tell ye 'bout the time my brother'n-law had raisin' carrier hens up to Killawog a spell ago?"

"Carrier hens?" interrupted Bud Brown. "Ye mean carrier pidgins, don't ye?"

The old man stared carefully at Bud for nearly a minute and then drawled, "When I say carrier hens, I mean carrier hens. Who's a tellin' this story, anyhow?" Thus interrogated, Bud said nothing, and turning to the others, Uncle Sile resumed:

"That brother'n-law of mine was an ingenious cuss—a most ingenious cuss—

3839 Kimona Dressing Sacque, 32, 36 and 40 in. bust.

3824 Woman's Wrapper 32 to 42 in. bust.

always inventin' somethin'. Had a barn full o' contraptions, but I think his breed o' carrier hens is a leetle mite the smartest thing he ever done. One day he read a piece in the paper 'bout these here carrier pidgins, and how useful they wuz in war, and Sam got to wonderin' if he couldn't make use ov the 'fundamental principle' 's he called it. He thought on't fer several days, an' one afternoon, as he was drivin' one ov Bill Jasper's hens out ov the tomater patch, a bright idee struck him.

"Jasper owned a farm a few rods down the crick from his'n, and this old hen used to cross th' crick and go up to Griggs's barn to lay every day. She was the worst thing to steal her nest you ever see. Sam's idee was to git holt ov that hen and start a breed ov carriers. He offered to swop a dozen aigs fer her, and Jasper allowed he'd take him up, bein' 's how the hen wuz up to Griggs's most ov th' time, anyhow—leastwise most ov the time when she ort to be on duty, 's ye might say, to home. Only Jasper said he thought it tuck considerable nerve to offer to swop aigs fer her, long's most of the aigs wuz his'n, by rights.

"However, Sam got the hen and went to work right away experimentin' with his new breed. Knowin' that hens can't fly very far, he decided to make his'n walkers, and mated the hen with the longest legged Shanghai rooster he could find. Well, sir, the scheme worked like a charm. By Fall Sam had a big flock ov young pullets, and every one of 'em carriers. They wa'n't much to look at, but they wuz good layers. He built a lot of coops on the sidehill back ov the house, and put a few pullets in each one, and ev'ry mornin' as reg'lar as clockwork they all come down to the barn to lay, and then went back ag'in. Sam kept movin' the coops further away till some o' them pullets walked two miles ev'ry day to lay. The exercise seemed to be good fer 'em, and they laid bigger and nicer lookin' aigs than anybody else's. Sam always got a cent or two a dozen more fer 'em at the store. The storekeeper told the neighbors what nice aigs Sam wuz gittin', and Sam he kept braggin' 'em up, tell by Spring ev'rybody in the county had heard ov 'em, and ev'rybody 'at heard ov 'em wanted a settin ov aigs. So Sam supplied the hull neighborhood at a good figger, but he didn't say nothin' 'bout their bein' carriers.

"That Summer Sam spent a good deal ov his time fixin' up cosy little nestin' places all about the place, and along toward Fall the fun commenced. Jest as soon as one ov them pullets got ready to lay, instinct wuz too much fer her, an' she would kind o' sidle off tell nobody wuz lookin', and then make a bee line to Griggs's to hunt a nest. Sam was kept pretty busy gatherin' the aigs, and I guess they would have been a drug on the market if Sam hadn't got in with a feller from New York 'at give him a good price fer 'em on account ov their size and looks.

"The neighbors couldn't understand why they didn't git more aigs, but they never mistrusted the new hens, 'cause Sam's wuz doin' so well. The next Spring Sam paid off the mortgage on his house with the purceeds from them aigs, an' if it hadn't been fer his everlastin' experimentin' I 'spose he might o' had a fortune by this time."

Here Uncle Sile paused, as if he had reached the end of his story, until Dave Miller broke the silence by inquiring, "What finally become ov the carrier hens, Uncle Sile?"

"The carrier hens?" echoed the old

gentleman, carelessly, as if they were the furthest from his thoughts. "Oh, yes. Well, you see, Sam wa'n't willin' to let well enough alone. He kept breedin' them hens up so'st they would be able to stand it to be sold further away from home. After he'd got 'em started, 'pears like the homin' instinct got stronger with ev'ry new batch of chickens. This would 'a' been all right if it hadn't got into the aigs, but when they got so'st they'd roll right out ov the box an' start fer home if they wasn't smashed, it spoiled Sam's market. At first they thought it was rats, but finally they ketched 'em at it. Sam had killed off all the old stock and the new ones wouldn't lay anythin' else. He tried to start the instinct back ag'in, but it wouldn't work, an' he finally wrung the necks ov the hull flock and quit the business. It nearly broke Sam's heart to do it, but I guess it kind o' cured him ov experimentin' too much." And before anybody could ask further questions, Uncle Sile had adjusted his battered hat on his bald head and shuffled up the road in the twilight toward home.—New York Tribune.

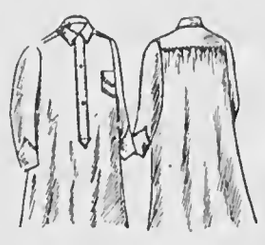
A Dream Realized.

The old, nearly square, two-story farmhouse, painted white, with green blinds, stood close by the roadside, facing the west. I reckon you are all familiar with this type, so common to New England, and have learned to appreciate the pleasant rooms of the interior, which belie the promise of the plain, bare, exterior. Imagine it the home of a farmer's wife, who is fond of flowers, who has always longed for more room for her plants. To be sure she has always kept plants with pretty good success, considering unfavorable conditions; some at the one south window in the sitting room, which overflowed, or were often promoted to the west front windows on special occasions to the discomfort of the family, until at times there seemed to be no window in the house one could see through. She also kept a few at the south window in the bedroom, moving them out at night. Some way she managed to keep a good many through every Winter, upstairs, down cellar, and "in my lady's chamber," moving them about, according to the weather and growth.

But now you have only to open your eyes to see an addition built across the south end of the old farmhouse six feet wide. This addition satisfies three needs. At the east end is a clothes press five by six feet, with a door opening into the bedroom. Next comes the plant room or conservatory 6x14 feet, finished in southern pine with four large windows (with only a post between) facing south and a glass door facing west, opening on to a cozy little porch 6x12 feet. This door is of course kept closed in Winter, making five windows for plants. A doorway opens from the plant room into the sitting room, and a glass door which can be closed when desired opens also into the bedroom, so the sun and light shine through into the inside rooms more freely than before. A close underpinning of stone and brick under the whole addition insures warm floors, the heat coming from sitting room and through bedroom making it plenty warm enough for the plants, on sunny days almost too warm. During very cold nights frames covered with thick brown paper are slipped between the benches of plants and the windows and door, as an extra protection against freezing. A few early doubters (there will always be doubters) declared plants would freeze there some Winter, but they have been proven mistaken, and doubt no more.

Even this fortunate farmer's wife doubted whether she should ever be able to fill her room without going to the florist. But before she had much time to doubt her room was full to overflowing, and might have taken a premium as an autograph room, so many of her friends and neighbors were represented there. She had already several varieties of Chrysanthemums which she thought would help fill up early. They did. Every window reflected a different variety of these beautiful showy blossoms. One window contained a box of mammoth dark red variegated with gold; another large, golden, curved-petaled, fragrant blossoms; another masses of snowy white bloom, and still another a wealth of golden clusters, while boxes of star-pointed white, old rose, pink and yellow were banked at each end of the room. These made the room gorgeously gay until nearly Christmas time. Long before they were gone the other plants began to crowd and fairly clamor for room and sunshine, until her husband declared that they would have to take in the porch by another year. Seven varieties of Begonia found room on a table at the back of the room, between the doorways, receiving almost too much sun there, while a spotted-leaved one over six feet tall, filled the corner niche by the sitting-room doorway. Giant red and pink cactus flanked the Begonia table at each end, which will be transformed into things of beauty toward Spring.

A florist told her that if she would fill some long narrow boxes with sand and set her plant pots down into the sand the plants would grow much better, as the sun would not burn the roots, and the earth would hold the moisture. So after moving the Chrysanthemums she put in her window boxes, resting on stool-like frames, and planted her pots of geraniums, pinks, double Petunias, heliotrope, Mahernia, etc. The Christmas and lobster cactus, which were full



3814 Boy's Night Shirt, 6 to 16 years.

3832 Boy's Outing Shirt, 8 to 16 years.

of buds, she suspended before the windows, by screwing large screw eyes into the ceiling, and making suspending wires of telephone wire bent at each end. Small brackets at the side of the windows held small pots of smilax, Fuchsia, double nasturtium and pink Oxalis; the white Oxalis being so large as to require a small round table. Three varieties of Gloxinias in one large pot, which at first could find a place anywhere soon required another round table, but make a beautiful show of velvety leaves and buds now. The calla also begins to call for room and water.

She made the common mistake of trying to force the Spring bloomers, consequently two large Hydrangeas turned yellow, and were shedding their leaves and sprouting anew when they should begin to bud. They should have gone into the cellar in the Fall for a while as usual. One of the contributions, a five-foot fig tree, met with the same consequences. The century plants went into the cellar to begin with, and she begins to think a gift fern-ball should have been put away until toward Spring instead of trying to start it at once. Many busy but pleasant hours has this farmer's wife spent in her new plant room with her bird and flowers. She has discovered that her husband's fly-killer, bought last Summer, is just the thing for spraying her plants. She treats them not only to clear water baths, but with tobacco water, and smokes them w tobacco to destroy lice and white flies. The whole family find it a delightful sewing and reading room both in Summer and Winter and consider it worth all it cost aside from the plants, which give much pleasure. ALICE E. PINNEY.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Rural Recipes

Stewed Figs.—Use the California figs and stew or steam them same as prunes, but without soaking, until tender; drain them from the water in which they are cooked, using it for making a syrup, flavor with a little stick cinnamon. The imported figs may be used, but must be thoroughly washed in warm water.

Chicken Sauté.—Cut a small spring chicken into four pieces and place on ice to get very cold, or dip quickly into ice water. Season with salt and pepper and cover well with flour. Put enough fat, vegetable oil is best, in a frying pan nearly to cover the pieces of chicken, fry each piece a rich brown on all sides; when done, place on a hot dish. When all are fried, make a cream sauce with two tablespoonfuls of the fat in the pan, two level tablespoonfuls of flour, a half pint of milk and salt and pepper to taste. Pour this over the chicken and sprinkle a little finely minced parsley over it.

Scallop of Corned Beef.—When fresh vegetables are plenty it is economical to have a meat dish of some left over. Put one pint of milk in double boiler, add a cupful of celery cut in dice, and three small onions. Cover closely, heat to boiling point. Cream together four level tablespoonfuls butter; the same of flour; stir into the hot milk, first removing the onion and celery. Stir and cool until sauce is smooth and rather thick (about 15 minutes). Then add two cupfuls of corned beef cut in cubes. Pour the whole in a buttered baking dish. Cover with fine bread crumbs, moisten well with melted butter. Bake in oven until crumbs are brown.

Panned Tomatoes.—These are excellent served with roast meats. Put in a pan with two ounces of butter six firm tomatoes that have been cut and halved. Cook slowly on the top of the range for 10 minutes, then brown quickly in the oven. Remove the tomatoes to a hot platter, and make a sauce by adding to the browned butter two tablespoonfuls of flour, and after it is rubbed smooth one pint of milk. Stir until boiling. Season well with salt and pepper and pour over the tomatoes. Garnish with parsley and points of toast.

Rhubarb Jelly With Apples.—If you are fortunate enough to have some good cooking apples left by the time rhubarb is well grown this is a good recipe to use: Skin and cut into bits five pounds of rhubarb. Add to it three pounds of cooking apples peeled and quartered, the juice of six lemons, and the grated peel of one, and two pints of water. Stew them together gently until they are a pulp, then strain through a cheesecloth bag. For each pint of juice use a pound of granulated sugar, let it boil, skim carefully, and when it will "jell" when dropped on a saucer take it off. Pour into glasses and cover.

Rice with Strawberry Sauce.—Put four cupfuls of milk in a double boiler, and when boiling hot pour in three-fourths of a cupful of rice, one tablespoonful of butter, one scant teaspoonful of salt, three tablespoonfuls of sugar, and cook one hour. For the dressing, use one cupful of powdered sugar, one tablespoonful of butter, beat to a cream, one large cupful of fresh ripe strawberries, mashed through a sieve, add to sugar and cream, and lastly stir in the well-beaten white of an egg. In serving pour the rice hot or cold on a platter, then pour the strawberry around it.

"Never Fail" Sponge Cake can be both made and baked in 35 minutes: A good sponge should be yellow as gold, of velvety softness and tender as a marshmallow. If the rule here given is strictly followed, such a cake will be the sure result: Separate the whites and yolks of four eggs. Beat the whites until stiff enough to remain in bowl if it is inverted, then beat into them one-half cup of sugar, which must be fine granulated (powdered sugar makes tough cake and proper beating does away entirely with the grains). Beat the yolks, add to them one-half cupful of sugar, beating for five minutes by the clock—this latter being important, as the delicate texture of the cake depends upon it; add to the yolks the grated rind and juice of one lemon. Now beat well together the yolks and white. At this stage beating is in order, but must be absolutely avoided after adding the flour, of which take one cupful. The mixture should now look like a puff ball, and the flour is to be tossed or stirred into it with a light turn of the wooden spoon. Stirring is quite different from beating. The cupful of sugar must be generous, the flour scanty. Bake for 25 minutes in a moderate oven. Just before putting in the oven sprinkle on top through a sifter about a tablespoonful of granulated sugar. This gives the "crackly" top crust so desirable.

THE "1900" FAMILY WASHER FREE.

Greatest Invention of the Age. Labor and Expense of Washing Clothes Cut in Two.

No More Stooping, Rubbing or Boiling of Clothes.

Every Household Needs One.

THE "1900" BALL-BEARING FAMILY WASHER

will be sent absolutely free to anyone answering this advertisement, without deposit or advance payment of any kind, freight paid, on 30 days trial. The 1900 Ball-Bearing Washer is unquestionably the greatest labor-saving machine ever invented for family use. **Entirely new principle.** It is simplicity itself. There are no wheels, paddles, rockers, cranks or complicated machinery. It revolves on **bicycle ball-bearings,** making it by far the easiest running washer on the market. No strength required, a child can operate it.

No more stooping, rubbing, boiling of clothes. Hot water and soap all that is needed. It will wash **large quantities of clothes** (no matter how soiled) **perfectly clean in 6 minutes.** Impossible to injure the most delicate fabrics. As the Sup't. of the Savannah Yacht Club says:

"*It is a wonder. Our washing is very large and we have always had two women on Monday and one on Tuesday. Our cook and the yard boy* **now do** *the washing in 4 hours much better than before.*"

NEWMAN, Ills., July 5, 1900.
I can testify that the 1900 is the best washer and the easiest running machine. It will **absolutely clean** the clothes, cuffs, and bottoms of ladies white skirts better than can be done by hand. The washings that took my wife from 5 to 7 hours to put out by hand, can easily be done in 2 hours. R. A. SKINNER.

KENSEE, Ky., March 21, 1900.
I did a double washing for myself yesterday and made 65 cts. from my boarders, besides all my cooking, milking and housework. It takes less soap with your machine than in the old way. I have no need of the washboard any more Mrs. L. A. BARTON.

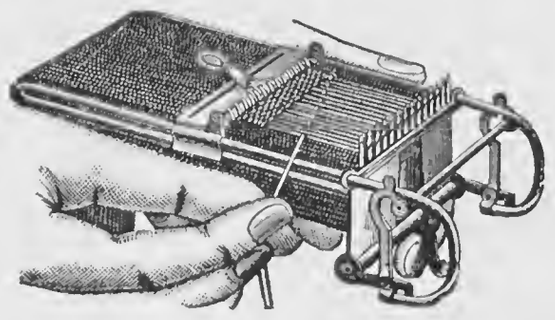
ONALASKA, Wis., Jan. 4, 1901.
We are a family of 5 and as I had a 3 weeks wash it was an immense one. I had it all out in 3 hours and never had nicer looking clothes. I did not even put my hands into the water. I cannot too strongly recommend the "1900" washer. Mrs. J. M. WILSON

Write at once for catalogue and full particulars to

"1900" WASHER CO.
143 J State Street, Binghamton, N. Y.

A Darning Machine.

This is the only successful darning machine we ever saw. We have tried others that were absolutely of no value. This one is little short of perfect. It enables you to mend underwear, stockings, curtains, table linens, clothing, and does an endless variety of art and fancy weaving better, easier and quicker than



by any other way. Full directions accompany each machine. When a lady has once used this little machine, she would not do without it for any consideration. We will send it postpaid for $1, or for two new yearly subscriptions at $1 each. All money returned if no satisfied.

BUSINESS BITS.

THE advantages of a wheelbarrow around a farm or country place need not be dwelt upon. It is convenient in a thousand ways. Don A. Gilbert & Co., Bainbridge, N. Y., offer a good one at a reasonable price, or you can buy the wheel and make the body yourself. Write for full information.

EVERY farmer can be his own blacksmith to a certain extent. There may be some jobs requiring skilled labor; ordinary repairing he can manage if he has a forge and proper tools. J. M. Drew, St. Anthony Park, Minn., offers a book telling all about tempering steel, shoeing horses and, in fact, all farm work. The price is 50 cents, postpaid.

THE patent grooved-tire wheels made only by the Havana Metal Wheel Co., of Havana, Ill., have, after testing them for four years, proved to be entirely reliable and satisfactory. The groove in the rim of the wheel is a feature not found in any other wheel, and one that adds much to the durability of a wheel, as the heads of the spokes are down in the groove and are so protected that they cannot wear off. When the heads of the spokes wear off the wheel is gone, as the spokes simply pull out of the tire. These wheels are made any size to fit any skeins. This concern also makes 10 kinds of low-down truck wagons. Write them for prices.

THE farmer who possesses his own thrashing outfit reaps many benefits over the man who depends upon the professional thrasher for the thrashing of his crops. Beside saving the loss and delay attendant upon waiting the convenience of the traveling thrasher there is a big gain in actual cash. The Columbia thrasher, built by the Belle City Manufacturing Company, of Racine, Wis., is one of the most popular machines among farmers in all sections of the country. It is a small thrasher of large capacity and guaranteed to thrash, clean and separate all grain as satisfactorily as the large machines. It is small and compact, can be run by any kind of power—horse, tread, steam or gas engine—and is light and portable, can be hauled anywhere that a wagon can be taken and with as little trouble. It requires but few men and the parts are so constructed as not easily to get out of order. All parties interested should write to the makers for their large and handsome catalogue fully describing this machine, as well as their full line of other farming implements. It is sent free to any address.

GREAT RESULTS.—Without any desire to "go one better" than Mr. Peek and Mr. Allen, regarding the truth of catalogue illustration, I have this to say: Last Fall I saw a bed of white Aster (Ostrich Plume) that was a wonder to the entire county (Washington, N. Y.) A picture would have looked like a solid white cover over some bushes, so thick were the blossoms. Within a few feet of this glorious display of snow-white flowers, was a small pear tree, upon which the fruit hung so heavy as to require stringing up with a perfect network of twine, with three poles stuck tent fashion. There was hardly a leaf to be seen; the pears were a Winter variety, rich green, with just a flushed cheek from the sun's kisses, and so uniform in size as to remind one of molding bullets. I could reach to topmost pear, without any effort, or as much as an extra blade of grass under my feet. A picture of this tree would have been put down as too absurd for use, as the limbs would have looked for all the world like *strings of beads* instead of natural fruit. The yield from this tiny little tree was five bushels. Some dwarf nasturtiums were the most gorgeous in colors and size I have ever seen; and although we picked thousands daily, there never seemed to be any fewer blossoms until the middle of October when frost killed them in "full dress." So you see nature does respond when treated right.

BOOK BULLETIN

For Sale by The Rural New-Yorker

My King and His Service, by Frances Ridley Havergal, well known as a writer of devotional books. We have a few copies of this work beautifully bound in red and silver. Price, postpaid, 15 cents.

The Horticulturist's Rule Book, by Prof. L. H. Bailey. A great amount of information in condensed form for fruit growers, truck gardeners, and florists. Remedies for injurious insects and plant diseases, and methods of killing pernicious weeds. Tables and rules useful in farm computations. Price, postpaid, $1.

Cut Price Books. Any of these 20-cent books sent postpaid for 10 cents:

Chemicals and Clover.
Fertilizer Farming.
Fertilizers and Fruit.
My Handkerchief Garden.
Milk, Making and Marketing.
Accidents and Emergencies.

The New Rhubarb Culture, by J. E. Morse. R. N.-Y. readers are acquainted with Mr. Morse's writings on this subject, and gardening in general. Part I. gives full details of his methods of growing and preparing rhubarb for market, with 34 recipes for cooking and preserving it. Part II. deals with the methods of other well-known growers; 29 illustrations. Price, postpaid, 50 cents.

A TRIP THROUGH SOUTHERN NEW YORK.

Leaving the Hudson River at the west near Newburg one soon gets beyond the general fruit belt; but driving through this country one cannot help but observe the evidences of old settlements as indicated, less perhaps in the cultivation of the fields than in the improvements of farm buildings, and especially in the decorations of the home grounds. The city suburbs and rural towns no longer monopolize the evidences of culture and refinemen. The farm homes bear every indication of comfort, and the grounds about them bloom with the rose, the honeysuckle, Spiræa, snowball, and countless other varieties of flower, creeping vine and ornamental foliage. One is a little disappointed, however, in driving through this rich and fertile country, to observe the neglect of orchards and the general lack of small fruits for family purposes. In some sections, and to a large degree in all sections, the lack of vegetable gardens is also apparent. Some parts of Orange County have run too exclusively to the horse and the cow, yet while Kentucky may beat her in raising fast horses, and Delaware and Madison counties may rival her in the production of milk, she is yet favored in matter of location, in climate and in soil, and besides her sons are now as they ever have been prominent in the councils of both State and Nation. I drove over the old turnpike which connects the Hudson with the Delaware almost its entire length. At Montgomery we crossed the Wallkill, with its rich fertile meadows, leaving the village of Walden, where it is said 80 per cent of the knives manufactured in this country are made. It is a rich fertile farming section all the way up to the base of the Shawangunk Mountains at Bloomingburg, but the frequent piles of weatherbeaten manure seen in the farmyards give an idea of want of thrift hardly in keeping with the county as a whole.

As one climbs the mountains and passes over into Sullivan County, the whole condition of the county is changed. In Orange the improvements seem to be for the comforts of the family; as you approach Sullivan the preparations all seem to be for the entertainment of Summer boarders. On one side of the mountain you leave fertile fields; on the other, except for a narrow valley at the base of the hills, you approach barren wastes. You leave behind sluggish streams; you meet clear bubbling springs of crystal water, murmuring brooks, and rapid streams. "That tired feeling" seems to have left you as you climb the first hill beyond the narrow valley. There is no malaria in Sullivan, nature seems to have fitted it for a Summer home for tired city people. For the first 12 miles there is little attempt at cultivation. It is a dry stretch of barren waste. Yet leaving Wurtsboro one sees Summer cottages built by city men stretching along for miles, and others in course of construction. On the topmost brow of this barren plateau is the Sullivan County Club. A number of individuals secured possession of a large tract of land here, including some fresh water lakes, and erected a club house. Others have bought sites and built cottages. I was agreeably surprised at the number of these cottages as well as by their neat and attractive appearance. The view from the point is extensive and most interesting. General cultivation begins again as the Neversink River is approached, and farm conditions improve to the west as far as Callicoon and north to the Ulster County line; but the Summer boarder and the city Summer resident are getting to be more and more a factor in the development of the county, not only in the villages and special resorts, but also on the farms throughout the length and breadth of the whole county. It is hard to get any idea of the number of people who go to summer on the farms; but at Monticello nearly 4,000 people rest for longer or shorter time as circumstances will permit. City men are also buying farms and building Summer residences in this vicinity. What is probably one of the finest private Summer homes in the county is located on a high elevation just east of the depot. It has recently been erected by Mr. John O'Neil. When the ground was first purchased there was little to recommend it except its superb location and commanding view. A liberal fortune has been expended in clearing the grounds, in masonry and in building; the house is modern in all its appointments as well as in finish and general construction, and commands a view as far as the eye can see, covering a radius of not less than 25 miles. The grounds have already been planted with ornamental shrubbery and with plans now under contemplation to furnish it with well developed stock adapted to the location and severe climate of this section, the landscape effect will be in keeping with Mr. O'Neil's original and lavish plan for a Summer house.

J. J. D.

LONG ISLAND NOTES.

Black Soil.—On the road from Long Island City to Flushing one sees a good many small patches, half an acre or a little more, of low land, which has been drained and is used for vegetable growing. This soil, largely decayed vegetable matter, is black as tar, and, when so fertilized as to give it a proper balance of plant food, produces excellent crops, especially of onions. Weeds are the great pest to the tiller of this soil, and in wet seasons like the present it is almost impossible to keep them down, as they grow so fast, and the land is too soft and greasy to work. I saw some plots of onions so completely overgrown with weeds that the owners had evidently abandoned them. In one place I stopped to look at what appeared to be a field of cultivated mustard, but found that it was planted to corn. The wild mustard had taken complete possession, and was waving its yellow flag to such an extent that the corn was entirely hidden.

A Back-Aching Job.—Of course weeds between the rows of vegetables can be subdued by cultivation, but those in the rows must be pulled out by hand, something of an undertaking in large fields. Considerable of this gardening is done by foreigners from sections of Europe where women are accustomed to working in the fields, and a good many are seen here, weeding or hoeing. I have seen workers using a little box or stool to sit on while pulling weeds, but the more common way is to get down on the knees. Now and then a man whose backbone seems to be fitted with ball bearings, stands up to it. Those doing such work as picking up potatoes can materially lessen the backache by learning to bend at the hips and keeping the backbone as nearly straight as possible. A man who was noted for his ability as a potato picker gave me this hint, and I have found it quite effective.

Horseradish is cultivated to some extent in this section of the Island. This is an uncertain crop; that is, the price obtained varies greatly. Sometimes it sells for $1 a barrel or less, and at others $1 for a small basket, about three pecks. As everyone knows who has tried to exterminate it, it is a strong grower, and every little piece of root that is left in the soil will make a new plant. It is, if anything, harder to get rid of than the artichoke. When planted for commercial purposes, the roots are set in Spring 10 or 12 inches apart in rows three feet apart, and cultivated the same as corn. Of course, the richer the soil the larger and finer the roots. In digging it is necessary to be careful about breaking off the roots, if the field is to be used for another crop the next season. I saw some plots of horseradish in the black soil spoken of above. This is well suited to it, being deep and mellow, so that the roots have every chance to develop, and are easily dug.

Asparagus.—About 15 miles northeast of Flushing is a tract of land six or seven miles wide, extending into the water about five miles. On one side is Hempstead Harbor, and on the other Oyster Bay. In this section great quantities of asparagus were formerly grown, but of late years the rust has worked such havoc that many have given up the business. There are, however, scattered pieces here and there, and those who have had fair crops this year have been well paid for their perseverance on account of the high prices received. In some notes from this vicinity last year, mention was made of an asparagus man who, while others were giving up the business in disgust, was setting a large new bed. This man is George H. Townsend, of Glenhead, and he is the most extensive grower I found in that district, having at present about 25 acres in asparagus. The new plot he set out last year looks unusually fine. Worms and beetles have been active on some of his fields. A spray of Paris-green had destroyed a good many of them; but there were enough left, either new arrivals or those that had escaped, to make another dose soon necessary. Mr. Townsend intends to use Bordeaux Mixture for the rust this season. Thus far he has worked on the principle of high fertilization and good care, and his success is certainly a strong argument for these methods. He believes in setting out strong roots, giving them every chance to develop, and not continuing the cutting season too long. The plants are thus much more likely to get the start of the rust and pull through the season in fair shape than those that are starved and cut until they have but little vitality left. In the new bed above mentioned, cutting was stopped about June 1. Conover's Colossal is the variety Mr. Townsend uses most extensively. He is making tests of Palmetto, which is claimed by some to be partly rust-proof, but did not seem to be very enthusiastic over it. However, his tests have not been carried out long enough to give any very definite results. He believes that high culture and the use of Bordeaux Mixture, where it can be applied properly, are the best means of dealing with this rust. No one with common sense would expect to get the best work from a hired man by starving him and making him work 18 hours a day; and the same principle, to some extent at least, will doubtless apply to a starved and overworked asparagus plant.

Fruit.—Long Island is not considered a fruit section, yet here and there are fair-sized orchards of various kinds, and most farmers have at least a few trees for their own use. The outlook for apples and pears is slim. I found some farmers near Glenhead and Roslyn who thought they might have half a crop, but most orchards that I examined showed but few pears and fewer apples.

Rye for Straw.—No great amount of rye is sown for grain, but a good many farmers have a small field which they cut for horse bedding. For this purpose it is cut after it is too large for hay, but before ripening, and while the grain is so soft that in curing it dries away to a mere skin. In this stage the straw is exceedingly tough, and makes much better bedding than ripe straw. Most of the farmers who do this either have fine horses of their own, or sell the straw to those who keep fancy horses, many of which are found in the vicinity of Mineola.

Potato Bugs.—The hot, dry weather of the past week brought these pests out in full force, and growers have had to be liberal in their use of "French bitters," as one man said, referring to Paris-green. If some one would invent a scheme for extracting the active principle from poison ivy and preparing it so as to be fatal to the Potato beetle, enough of this might be gathered from the rougher parts of Long Island to make way with all the Potato bugs in existence. The cold wet spell made potato planting several days late. Some fields had to be planted over on account of the seed rotting in the ground. Others used damaged seed that had been cut and held for several days because of the rain, and these plants looked sickly. They may come along in fair shape later, but it is doubtful whether they will make a satisfactory crop. Planting inferior seed of any sort is a poor investment.

Acres of Garden, yes, hundreds of acres of it, may be seen in the vicinity of East Williston, Mineola, Garden City and Hyde Park. This section is a great flat, and the most intensive culture is practiced. These large tracts of land get better care and fertilization than most farmers give to their small gardens. I saw potato fields containing from 25 to 30 acres, the rows straight as a bee line, and the vines that healthy dark green that a potato shows when he is well satisfied with the conditions under which he is living. W. W. H.

On page 387, upper right-hand corner, writing of balsams, the types made the writer say "Keeping off all dead branches," when it should be *side* branches. The result of keeping off the side branches is to grow the plant as straight as a broomstick with flowers thickly set on the trunk from bottom to top. J. Y. P.

A Lice Killer.—One ounce crude carbolic acid to one quart crude petroleum makes a very good lice killer for chicken houses, and we find it very satisfactory, sprayed on, for keeping flies off cattle. I have used the commercial article, but found it expensive, and think this an excellent substitute, and cheaper. C. P. L.

The Jolly Girl

Often changes to the jaded woman. "I can't see what's come over Mary; she used to be such a jolly girl," was the remark of a young woman visiting a married schoolmate. Marriage changes a woman. The drains and pains which are so often the sequence of marriage rob her of all vitality. Give her back her former strength and she'll be as "jolly" a wife as she was a maid. Doctor Pierce's Favorite Prescription gives back the lost strength by re-establishing the health of the delicate womanly organs. It dries the drains and stops the pains. It cures ulceration, inflammation and female weakness. It makes weak women strong and sick women well.

"For two years I had been a sufferer from chronic diseases and female weakness," writes Mrs. Allen A. Bobson, of 1125 Rodman Street, Philadelphia, Pa. "I had two different doctors, and they gave me medicine which only relieved me for a time. My niece advised me to take Dr. Pierce's Favorite Prescription. I concluded that to open a correspondence with you for your advice would be safest, so I did, and have been highly benefited. I find that after taking six bottles of 'Favorite Prescription' and five of 'Golden Medical Discovery' and following your advice in regard to local treatment, I am now a strong woman. Accept my sincere thanks for the interest manifested in my case and the happy results obtained."

Sick women are invited to consult Dr. Pierce by letter *free*. Correspondence private. Address Dr. R. V. Pierce, Buffalo, N. Y.

MIXED WIRE NAILS

HOW TO MAKE SMALL CHEESE.

Can you inform me where I can get full directions for making cheese in a small way for family use? C. O. H.
Lewisboro, N. Y.

To give full directions for making cheese to one not accustomed to "curd mixing" would be no easy task, and I should not care to guarantee the product. Since I have gone on record advising cheese as a daily food on account of its digestibility, I fear the maker, if he has no other source of knowledge, only what he may glean from these notes, may consider that I am "off" on cheese as a food, or on methods.

Here are a few principles and rules that may be given, and if good judgment is used may prove satisfactory. We will assume the quantity of milk to be 500 pounds of four-per-cent milk, and if more or less, the amount of rennet, salt, etc., may be changed accordingly. The night's milk should be kept at a temperature of 65 degrees Fahrenheit, after being exposed to the air after milking. In the morning mix the two milkings together in a vat or tub not exceeding 20 inches deep; 15 inches would be better. The curd would cook more thoroughly, with less danger of packing in the bottom. A very simple and effective way of heating will be to use two small cans seven inches in diameter, and high enough to come above the milk. Fill these cans with hot water, moving the cans and agitating the milk until warmed to 84 degrees. If one desires colored cheese then add one-half ounce of some standard cheese color mixed with a half pint of water; mix thoroughly. Provide yourself also with 1½ ounce of rennet extract. Put the extract into a half pint of cool water; do not use warm water or keep it where it is warm, and add to this milk, stirring for two minutes. In about 25 minutes this coagulated mass will be ready to cut. Put the finger gently into the curd, and when it breaks clean over the finger it is ready. If no cheese knife is at hand previously provide yourself with a piece of galvanized iron woven wire with a half inch mesh, about six inches by 15 inches; draw it through the mass lengthwise, crosswise and from top to bottom. Of course it is a crude way of cutting, but will serve the purpose of breaking the mass and starting the whey. Keep the mass stirred so each particle will remain independent of another. In 10 minutes the heating cans should be brought on again, filled with hot water. Keep them moving as well as the curd to prevent overheating any portion of it. When the thermometer registers 98 degrees take out the cans and keep the mass stirred until the curd particles do not readily adhere; then stir occasionally until—well, let's see. This point is not so easily told. The old, old way was to take off the whey when the curd squeaked between the teeth— that's not bad. I should of course rather depend upon the feeling and by smelling, but the beginners would better use the first rule mentioned aided by the feeling. Take a handful of curd, squeeze it hard, let go. If it has an elastic feeling showing it to be well dried out, then take off the whey.

Keep the curd well stirred until it is free from moisture and cool, which will require about half an hour. It may be more convenient after removing the whey to take the curd into some other receptacle, where the moisture will drain out more easily and quickly, either by a slanting bottom or a rack with a cloth over it through which the moisture can drip. One pound of clean salt will be sufficient; add and thoroughly mix, and allow to remain before pressing for 15 minutes. Two hoops 11 inches in diameter and 12 inches deep, or one hoop 14 inches in diameter and 14 inches deep, will be needed, or if small 12-pound cheeses are wanted, get four seven-inch hoops, one foot deep. The amount of cheese produced from the milk will depend upon its fat contents. One can safely figure 2.65 pounds cured cheese to each pound fat in the milk, if the milk contains anywhere from 3½ to 4½ per cent butter fat. Make a cheese bandage to fit, and long enough to project past each end one inch or even two inches; it can be cut off. The bandage may be placed in before putting in curd and turned over the top edge of the hoop, to hold it while filling; use a round piece of cotton cloth at each end of the cheese. I would not advise any cheap, uncertain method of pressing; a 1½-inch screw set in a frame with means of turning, or send to a dairy supply house and get a press. If sufficient pressure is not applied the rind will not form and the whole job will be a failure.

After pressing an hour, take out, adjust the bandage smooth and cover the edges nicely, put on cap cloths of same material, with the cotton press cloths on top, and at bottom the same; put on a closely fitting follower, put to press again, and keep it there until the following day. Then take it out and cure in a room from 60 to 65 degrees for three weeks. If you have not slipped a cog somewhere the cheese will be presentable and eatable. From an economic standpoint, however, the job will be a failure. An equal amount of cheese can be purchased much cheaper of some reliable manufacturer or dealer, quality guaranteed. H. E. COOK.

WHAT GRAIN WITH PASTURE?

Will you give me a ration for milch cows, using oil meal, bran and shorts, clover and grass pasture in day time, hay at night? Would chop feed of corn, barley and oats do to mix in? C. H.
Lopez, Wash.

Formulating rations is much like taking some proprietary medicine when a fellow is ailing. Of course it won't usually hurt him, because as a rule there is not medicinal property sufficient in the emulsion to do so, but there is no knowledge except the advertisement on the package that it will benefit the case. With the present exhaustive tabulated list of food analyses formulating rations is much like dropping in a nickel and the machine does the rest. A man without actual experience in feeding stock can grind out rations and formulas as well as a cooking school graduate can compound wonderful mixtures of baked dough, etc., for mankind. In institute work I have always been very guarded in giving ration formulas, because there are so many unknown conditions. Among them are size of cow, power of digestion, age, breed, period of lactation, season of the year, temperatures, likes and dislikes of the cow, and last but not least, the disposition of the man who feeds and cares for her. I assume in this case that the cow is in fine flow of milk. If her clover and grass pasture is luxuriant, give her all she will eat of it, and three or four pounds of grain made up of equal parts of bran and shorts would be all the grain she could profitably consume. The amount of oil meal will depend upon the character of hay fed at night. If it is nice early-cut clover hay why feed her any oil meal? The ration will contain all of the protein necessary, and if the cow is a free milker she may need a pound or two of cornmeal. Her condition will indicate her needs. Do not fear abundance of green succulent food. The great Holstein breed was not built up on concentrated foods—plenty of grass did it. Her condition will be an index of the demand for concentrated food and its kind. If she is thin in flesh feed cornmeal, barley or oats. If fleshy add oil meal, cottonseed, wheat bran, brewer's grains (dried) or gluten. The milk flow will usually increase in either case. In the first case cornmeal will do it by giving her additional reserve force in the form of fat. In the second instance, the large per cent of protein will furnish the lacking vital force of milk production. These are general rules. The individuality of the cow can in no wise be cast out. Some cows, like some children, pay no regard to the findings of the chemist. They grow and thrive and perform their allotted functions on carbonaceous food. Many farmers who are not informed in the science of food, observe this peculiarity of certain animals, and consequently become incredulous as to the findings of science, and therefore lose much and sometimes all profit. H. E. COOK.

The Veteran Farm Team.

The picture on our first page, Fig. 194, shows our friend L. J. Farmer and his wife with two faithful old horses. This team for many years did the hard work of the farm, and also the lighter work on the road. They were faithful and true during their more than 25 years of service—more faithful than many of the humans who took a hand at the farm work during the same time. Finally in their old age, when stiff, sore and feeble, the old horses were humanely put out of the way, and we certainly regard this as a merciful act. There are many families who are troubled with the problem of what to do with the faithful old horse. He is past his prime, and both business and pleasure demand swifter feet and stronger shoulders. A younger and more active horse is needed, but the old fellow has done his duty for years, and has endeared himself to all the family. He might perhaps bring a few dollars if sold to some horse jockey or stable keeper, but who could bear to see the old horse abused? We all know the fate of the poor old horse who falls into the hands of some huckster or truckman. Some farmers avoid this trouble and responsibility by changing their horses frequently—always selling them before they are fully past their prime and buying younger horses in their place. We do not like to do this for various reasons, and as a result we are sure to be obliged to face the old-horse problem. We think it much better to kill the old horse—when he becomes feeble, but how is this to be done quickly and humanely? After experimenting with poison and chloroform we believe that a bullet sent by a good marksman into the brain or a heavy blow on the head with a sledge hammer is the best way to end life. The horse may be driven to the woods or fields where he is to be buried and there killed without pain. It is a bad job though, for one who loved the old horse in his youth.

ON March 28 I set three hens on 51 eggs; April 18 hatched out 47 nice strong chicks. Again on May 12 set seven hens on 105 eggs, which hatched out 101 chicks. What incubator can do as well? B. R.
Center Bridge, Pa.

St. Anthony Park, Minn.

CO-OPERATIVE CREAMERY NOTES.

A Successful Enterprise.

The Union Center (Broome Co., N. Y.) Coöperative Creamery Company produced during the month of April 3,345 cans of milk, manufactured 14,242 pounds of butter ,and sold the butter in Binghamton at the highest market quotation. The milk netted 76 cents a can for the butter sold, with the separated milk returned free. The New York Exchange price for April was 74 cents a can. Two cents a can on 3,345 cans, $66.90; estimating 3,000 cans of separated milk returned at 10 cents a can (the patrons of Union Center claim it is worth 17 cents to feed) gives $300, aggregating $366.90 received above Exchange price for April. On the same basis for June, with Exchange price 20 cents a can lower, and butter one-half cent a pound higher than for April, 3,345 cans at 22 cents, $735.90; 3,000 cans separated milk returned, at 10 cents, $300; 14,242 pounds of butter one-half cent higher, $71.21, aggregates $1,107.11 above Exchange price for one little creamery for one short month. Report for May received since writing the above is as follows: 4,480 cans produced; price of butter same as for April. Amount received for butter and separated milk above Exchange price was for the month $955.52. If the increased quantity of milk for May over April should be maintained for June its surplus would be increased $350; 30 per cent annual dividends are paid on stock. J. J. B.

Campville, N. Y.

In Sullivan County.

Frank Beyer is still making a success of the management of the farmers' coöperative creamery at Mongaup Valley, N. Y. Like all other lines of business, he loses a customer occasionally, but gets another to take his place. A city milkman seems to have worked the old game on some of the producers who patronized the coöperative creamery last year. He opened a creamery, contracted for milk, paid more or less promptly for a month or two, then let the bills run and finally disappeared between two days. The game has been worked so often it would seem that producers would be familiar enough with it to recognize the ear marks at once, but they don't. The farmers' coöperative creamery drove the Exchange creamery at Stevensville out of business last year. It is now closed. There seem to be no regrets on the part of farmers. Some of its old patrons are now carting to Liberty, where the farmers have a large coöperative creamery, which they are leasing this year under favorable conditions.

Easy Way to Handle Milk.

Having no running water, nor ice, we use an old-fashioned refrigerator, which is simply a water-tight box, with double lid, given a coating of boiled oil and mineral paint, and allowed to harden thoroughly, renewing from time to time. In the center of the bottom, where the strainer was, we insert a plug. Two tin pails, without covers, are used for the milk, and set in enough water from a deep cold well nearly to submerge the pails. A little stick under the edge of the cover gives ventilation, until the animal heat has escaped. In about two hours we pull the plug, letting the water run out, and fill again—when the milk becomes thoroughly chilled. We place this box on the north side of the house, under the shade of a tree, where the sun never strikes it, and have kept milk 48 hours perfectly sweet in the hottest weather, and raised about all the cream. We go through the same process after every milking. It works as well in Winter, the water never freezing until the thermometer reaches about zero. The beauty of this arrangement is that it is so easily cleaned. Needless to say, the utmost cleanliness is observed about the milking, and plenty of boiling water used in scalding all the milk vessels, including the box itself. CHAS. P. LEAKE.

New Jersey.

Questions About Oleo.

The following note is found in a recent R. N.-Y.:

At one time Holland led Europe as a dairy country. It began to encourage the oleo factory, while Denmark encouraged the cow. Of course, the Danes now lead the Dutch in dairying.

As a matter of fact does not Denmark buy more oleo from the United States than any other nation, considering population? Personally, I use nothing but best Jersey butter, made at home from my own cows; at the same time, out of curiosity bought some oleo butter several years ago, and could see nothing objectionable in its appearance or taste. Do you know that there is a firm opinion among the people, not farmers, that the creameries are the best customers for oleo, and are the ones that fight oleo butter to retain a monopoly of a mixed article? The farmer and his butter is simply "not in it." E. O. NATHURST.

Tennessee.

R. N.-Y.—In 1900 there were exported from this country 4,256,067 pounds of oleo and 146,739,681 pounds of the oleo oil. This oil was sent chiefly to Europe, where it is mixed with other fats and sold as oleo. The following table shows where most of this oleo oil went to:

	Pounds.
Holland	85,976,846
Germany	26,780,986
Sweden and Norway	13,500,332
Denmark	8,628,948
United Kingdom	7,265,764
Belgium	2,892,778

The largest exports of the manufactured oleo were as follows:

British West Indies	1,466,638
Germany	448,769
United Kingdom	364,712
Cuba	516,463
Porto Rico	219,140

The great bulk of the manufactured oleo goes to the West Indies and former Spanish islands. Our trade in this product with Europe or temperate countries is insignificant, because such countries buy the oil and do the mixing at home. It will be seen that Holland buys nearly 60 per cent of all the oil we export. It is quite notorious abroad that Holland has become the great headquarters for oleo making and that Dutch butter is regarded with suspicion. It was formerly classed with the best, but is now seldom quoted in the English market reports. Denmark imports about one-tenth as much of the oil as Holland does. The Danes do not buy a pound of the manufactured oleo. We believe that Denmark has a strict law prohibiting the manufacture or use of oleo colored to imitate butter. If made at all it must be of the natural color of the fats composing it. We have no objection to the use of oleo provided it is not sold as butter. We simply regard the yellow color as a counterfeit which enables unscrupulous dealers to sell a mixture of cheap fats under the guise of the genuine product of cow's milk. The opinion you refer to does not exist in this part of the country, and those who really investigate the creameries know how absurd such claims are.

Painting the Inside of the Silo.

What is the best thing to use to paint the inside of a silo? How would linseed oil (half boiled and half raw) do for it?

Lakeville, N. Y. R. H. M.

Opinion is very much divided. We have two silos, and they are not painted outside or inside. One of the silos has a portion of the staves painted with gas tar. We have not been able to see that the silage keeps any better where the staves are painted than it does where the staves are not painted. We have not found as yet any material which is better than common gas tar for the interior of the silo. This is better applied while hot, as it is then more penetrating than when cold. In heating gas tar the work should be done away from buildings, as the tar has a habit of boiling over the sides of the kettle, and the whole kettle of tar may take fire. Should this occur dump the kettle upside down upon the ground and the fire will be quickly extinguished. Painting the inside of the silo is for two purposes; that the silage may be better preserved, and that the staves or walls of the silo may be protected from decay. We cannot at the present time recommend any material better than gas tar. A preservative known as Carbolineum avenarius is said to possess wonderful powers as a wood preservative. We are making some tests of the material but we cannot state from experience its value. There are several mixtures on the market for painting boat bottoms. Some of these are of value for painting the inside of silos. We would not recommend linseed oil for the purpose. L. A. CLINTON.

Dried Blood for Calves.

We have heard much about the value of live blood introduced to the calf through the parent. Now Prof. D. H. Otis tells in a recent bulletin from the Kansas Station of the value of dried blood as a tonic for young calves. He gives two cases where blood seems to have saved the lives of sick animals, and given them a good start. He says:

"The Kansas Experiment Station has just purchased 20 young calves. Frequently these calves arrive at the Station badly affected with scours; a little dried blood always brings about a cure. Recently a test was made with five calves that happened to be scouring at the same time. With two of these dried blood was fed after reducing the regular feed of milk. With the other three the dried blood was fed without changing the supply of milk. In the former case the calves recovered from the scours after two feeds; in the latter after three feeds. With the 70 young calves under experiment at the Kansas Station during the past year, there has not been a single case of scours that dried blood has failed to check. In feeding dried blood, a teaspoonful at a feed is a great plenty. This should be continued until the scours disappear. In case of a weak calf, the allowance may be gradually increased to a tablespoonful at a feed. To prevent the dried blood from settling to the bottom of the pail, where the calf will be unable to get it, it may be stirred in the milk while the calf is drinking, or the milk and blood may be fed immediately after being thoroughly mixed."

NON-CRACKING BUTTER BOWLS.—In selecting a butter bowl care should be taken to get one as smooth as possible, as it is a sure indication of fine, close-grained wood if properly turned; a thorough sand-papering will improve all new bowls. Any new bowl will crack if water is applied to the inside only, or left in it any length of time before wetting the outside, as the wet surface immediately commences to absorb water and swell, while the outside remaining dry does not expand or swell, consequently when the pressure from within overcomes the resistance from the dry outside it has to crack. The bowl should be immersed in cold water for a few seconds and then aired for a few minutes, so that the expansion will be gradual and from all of the surface at once. Repeat the operation until the wood is thoroughly watersoaked; then it may be scalded in the usual way. Always wet the outside when in use. M. T. W.

VOL. LX. No. 2685. NEW YORK, JULY 13, 1901. $1 PER YEAR

SUCCESSFUL SPRAYER FOR THE PEA LOUSE

IT OPERATES ON A LARGE SCALE.

And Seems to Solve the Problem.

THE LATE SEASON.—The Green pea-louse is again threatening the late crop of peas. In this section last Winter was very favorable for the development of the pest, and we rather expected to see it make an early appearance. The continued cold, rainy weather of April and May throughout Maryland, Delaware and New Jersey, however, effectually checked its development, and as a result, as far as we can ascertain, early varieties have been practically uninjured in these States, and in Delaware nothing but early peas were planted. On May 16 the writer was able to find but a single louse on peas here and there after a most careful search, and failed to find them on clover entirely. But the rapid power of reproduction of this pest was then well shown. On June 5 the same fields were examined, and most of the terminals of Alaska were well stocked with lice, and Blue Beauty vines were well covered. The former variety was ready to cut, so that no injury was done it, and the latter was so nearly made that any injury would have been slight. Had any late peas been planted, however, they must have been inevitably as seriously injured as during the past two seasons. The absence of the lice on the clover in May is of interest, and raises some questions concerning the life history of the pest, which probably will need further study as regards its migration from one plant to another.

NEW SPRAYER NEEDED.—In THE R. N.-Y. for June 10, 1900, we gave an account of the Pea louse, and then mentioned that we were experimenting with spraying kerosene and water mixture. We found that 15 per cent kerosene was ineffectual against the louse on a hot day, evaporating so rapidly that no injury was done the lice; 25 per cent, however, killed all the lice it hit and did no injury to the vines as far as we tried it—on about one-fourth of an acre. Almost all of the lice were killed by the 25 per cent kerosene, which was very thoroughly sprayed over the vines from an attachment to a kerowater pump covering four rows at once, with one nozzle to each row. But knowing that the kerosene at this strength would probably do considerable injury when used on a large scale, no further tests were made with it. Our work convinced us that with four nozzles to a row, so that the vines could be thoroughly sprayed, and with the pump geared to the wheel of the cart, the Pea louse could be combated successfully, even on a large scale. We were led to give attention to the possibility of profitably spraying for this pest on account of the fact that some growers had not been successful with the brush and cultivator method, it failing to destroy a very large percentage of the lice brushed off on cool days, or on stiff soil forming lumps when cultivated. Furthermore, it is evident that in brushing, using either the cultivator or pan drawn between the rows, as the young lice in the buds are not disturbed, though very large numbers of the adult lice might be destroyed, especially when they had become numerous, it would be impossible to check the development of the first brood of the pest by brushing, as might be done with a spray which would reach and destroy the young lice securely resting between the terminal leaves. We therefore planned to construct an attachment for a barrel sprayer which would cover several rows with several nozzles to each row, and had submitted our plans to several spray-pump companies, when we learned through James Good, of Philadelphia, the manufacturer of whale-oil soap, that Messrs. Brakeley, of Bordentown, N. J., had constructed a satisfactory sprayer, and had last year successfully combated the Pea louse, using about 140 barrels of whale-oil soap. Upon corresponding with Messrs. Brakeley we learned that they considered their sprayer entirely satisfactory; after having sprayed a large acreage, and saved their crop by means of spraying last year, that they had duplicated their order of last year for 140 barrels of whale-oil soap, and intended to spray their whole crop of over 500 acres this year. Feeling satisfied that these men must have solved the problem of spraying the Pea louse, and as it was doing no damage to early peas in Delaware, we dropped the matter of constructing a sprayer, and awaited with interest a promised public exhibition of their machine. On May 13 Messrs. Brakeley kindly invited a number of persons interested to inspect the working of the sprayer in the field, among whom were Dr. J. B. Smith, New Jersey State Entomologist; E. J. Judge, of The Trade, of Baltimore, a prominent Philadelphia dealer in canned goods, and the writer.

NEW SPRAYING MACHINE FOR PEA LOUSE. FIG. 204.

TANK FOR HOLDING THE SPRAYING MIXTURE. FIG. 205.

A BIG MACHINE.—At a distance the sprayer looks something like a large grain drill. It consists of a large tank containing a simple pump, with air chamber on top of the tank, which is attached by gearing to one of the two wheels of the sprayer. Beneath the tank are pipes leading to nozzles, and the guides and lifters for holding the vines while they are being sprayed. The sprayer covers three rows at once, the peas having been planted in this way, but the inventors think that planting two rows at once and having a machine covering two rows would be preferable. As the sprayer passes along the vines are picked up by a wooden V-shaped fork, and pass between parallel iron bars which hold them upright. These bars are movable so that they do not tear the vines. Above each row is a cluster of three nozzles—Bordeaux nozzles are used—one directed forward, one backward and one stralght down. On either side of each row are two nozzles, one directed forward and one backward, and just above the ground is a nozzle on either side directed upward so as to give the vines a thorough under spray. The nozzles with the pipes and guides can all be thrown up about a foot by means of a lever, permitting the turning of the sprayer. The whole plan of the machine is simple and practical. It can be readily understood from the accompanying illustrations, Figs. 204 and 205.

VERY EFFECTIVE WORK.—Messrs. Brakeley were just finishing a 24-acre peafield, upon which six sprayers had been working half a day, when we arrived. The vines were about 15 inches high, being Champion Jr., a medium sweet wrinkled pea. The lice were not very numerous, although almost every bud had a small family of fast-maturing young. The vines were very thoroughly covered by the spray, and as nearly as we could approximate it from 80 to 90 per cent of the lice were killed; had they been thick fully 95 per cent or more must inevitably have been destroyed. On May 20 Mr. Brakeley wrote me that he could find but very few lice in this field, which is about ready to cut. Whale-oil soap was used at the rate of one pound to six gallons of water. It had been used more dilute, but it was found that a larger quantity of spray was required to be as effectual, and it was better therefore to use it stronger to avoid handling so much material. When the vines are small about 160 gallons, and when nearly full grown 300 gallons, are used per acre, which at three cents per pound for soap would mean $1.50 per acre for the materials. The soap was readily mixed with cold water, one barrel of soap being mixed to form three barrels, and this then dipped into the tanks, in which it was diluted and carried to the sprayers. The water for the tanks was pumped from a small brook, which had been dammed up, by means of a traction engine. One tank carried soap for each sprayer. With these six sprayers, six tanks, engine and three extra men, 50 acres a day are sprayed at a cost of $42.50 for labor and $75 for materials, or a total cost of $2.44 per acre. This may seem a good price to pay for combating the Pea louse, but when one spraying will ensure a first-class crop of medium and late peas, while otherwise they would be of in-

ferior grade, those who are growing a first-class article can well afford the expense, and were the lice thick enough to threaten the life of the crop two sprayings would certainly be profitable. Mr. Brakeley is spraying his whole crop of 510 acres this year, and though the lice are not thick enough to do any serious damage he believes that the spraying will pay in the superior quality of the peas, and we believe he is right. This sprayer was invented by Messrs. Brakeley and is covered by patents. They were unable to give us any exact estimate of the cost, but it was thought by those present that the machine could be built to order for between $150 and $200, and possibly for less if manufactured in quantities. Of course a small grower could hardly afford to own and operate such an outfit, but where peas are grown for the cannery on contract the packer might own and operate the machine, or some one owning a traction engine or doing similar work might find the work profitable. Messrs. Brakeley's sprayer was granted patents upon the combination of the device for lifting the vines and nozzles for spraying them. Of course various arrangements of nozzles for spraying crops in rows have previously been patented, and put on the market by spray-pump manufacturers. Early in the season, while the vines are still upright, we believe that any machine which will spray two to four rows with four nozzles to a row will be found satisfactory—and early in the season, before the lice have become numerous, is the time to spray with profit. But as soon as the vines fall over and run, a device for lifting them is absolutely essential, and Brakeley's sprayer is of value. If the Pea louse is to be with us every year—as it now looks—and we must fight it by spraying, it will be found desirable to grow low-growing sorts and to plant in perfectly regular rows.

Should the weather conditions be unfavorable for its development next year may see a practical disappearance of the Pea louse; but on the other hand, it may be as bad as ever, and should it not occur next year it may appear any time as suddenly as in 1899. As it should be fought early in the season to prevent injury we believe that spraying will be found profitable, and that the possession of a first-class spraying outfit, and its prompt use, will solve the problem of growing peas in spite of the Pea louse.

Delaware Exp. Station. [Prof.] E. D. SANDERSON.

MODERN CRANBERRY CULTURE.

ESSENTIAL PRINCIPLES OF THE BUSINESS

How to Start a Bog.

PART II.

CLEARING THE LAND.—During the Winter it is a good plan to get rid of the wood and brush on and around the swamp. The brush can be cut with a heavy brush scythe, or a billhook, and should be piled up and burned. The upland around the swamp should be cleared at least a rod back from where the shore ditch is going to be. This is to prevent the young vines from being shaded, and it gives room for a road around the swamp, which in harvesting time will be very convenient. When the frost comes out of the ground, find out which end of the swamp is highest, and then dig a main ditch through the center from there to the lower end. The width of this ditch should be regulated by the amount of swamp to be drained, but usually three feet in width at the top and two at the bottom of it is enough. In swamps that have a small stream running through them all that is necessary is to dig the shore ditch and then run the cross ditches from that to the stream, striking it at right angles.

DRAINING.—The upper end of the swamp being naturally the driest the work of turfing and grading is usually commenced there. The tools for this work consist of a broad-bladed ax, called a turf ax, and a heavy hoe with a blade about four inches wide and eight inches long, called a stub or grading hoe. These can generally be obtained at hardware stores, or if they do not keep them in stock they can get them from any wholesale hardware firm in Boston, Mass. The turf ax is used in cutting the turf into squares of about two feet each way, and these are pulled bottom up with the hoes. It is very important that the turf be turned over for the reason that it not only gives the surface a chance to drain and dry, but it also gives the graders a chance to chop up the roots of many sprouts that would spring up if this were not done. It kills the vegetation and gives a better surface for working. If there are any holes or soft spots in the swamp these should be carefully filled up and allowed to settle before any sand is put on. In grading, it is necessary to keep the surface as level as possible. All roots of any size should be taken out and burned or carried off. The surplus turf can be used to good advantage in smoothing up the rough spots in a road around the bog, or in laying the foundations of a dyke at the lower end if there is water enough to flow with. It is best, however, to keep the swamp level as high as possible, hence it is better to keep all good material on the bog. The surface of a bog that is continually wet in the Summer is worthless, and it will grow anything but cranberries.

PUTTING ON SAND.—The next thing is to open a sand-hole. This is done by clearing away the loam from the surface of a high bank until good sand is found. In some places around the swamp, the loam is not so deep, and it is a good plan to dig small holes in the banks until a shallow spot is found. Of course where there is only one high bank convenient this must be entered, no matter how deep the loam may be. When sand is found, a runway is dug into the bank about on a level with the swamp, and planks about six inches wide and two inches thick are laid from it out upon the swamp. The sand is then shoveled into a wheelbarrow and rolled out and dumped on the bog, where it is spread out very evenly at an average depth of three inches. When the bog can be flowed in Winter many wait until the water is frozen, and then do their sanding on the ice. This dispenses with the use of planks, and where the swamp is large saves quite a sum. The sand is spread on the ice the same as on the bog, and it soon works its way through, and will be found in Spring as level as desired.

SETTING THE VINES.—The month of April is the best time to set out vines, and they may be set out as late as June if the water can be raised so as to keep the bog wet. Some set them out in the Fall, but nothing is gained by that, as the vines do not root any sooner than if they were set out the next Spring. The vines are set out in hills consisting of five or six pieces of vine about six inches long. There are no roots connected with these, and one end of the hill is shoved through the sand into the mud or peat, and the other end is left projecting an inch or two above the sand. Just how far to set these hills apart is a matter of some discussion among growers, and perhaps the distance should be varied according to the variety of vines used. Eighteen inches apart each way for early vines and 14 or 16 for late ones is a safe rule to follow. A good marker is made by inserting hard wood or iron pins about an inch in diameter, with the points rounded, in a piece of 2x4 scantling at the desired intervals. By dragging this first one way and then the other, and setting the hills where the lines intersect, a regularity is obtained which will enable the grower to ascertain the exact progress of the vines in covering, and which variety covers the quickest. It is best to keep each variety ditched off on a section by itself. This prevents mixing the varieties, and gives the grower a chance to see if he is getting what he ordered, and what is more important, it enables him to tell what variety is best suited to his bog.

THE VARIETIES.—It is a good rule to choose vines according to the climate that they are to be grown in. There are about 200 different varieties, but many of them are worthless, and have only been results of experiments in crossing good varieties. Among those that can be relied upon are the Early Black and Early Red for early berries that ripen from the first to the middle of September, the Howe and Smalley's, that come a little later, and for late varieties, the Bugle berry and the McFarland. For those desiring early shipments on account of frost, sound fruit and good yielders, I cannot speak too highly of the Early Black and Early Red, especially the latter, which is a large, round berry, solid to the core. This berry ripens about September 10, and while it is a fair keeper, I advise immediate shipments, relying upon its good appearanec for a ready sale even though the market is temporarily overstocked. The advantage of the Early Black lies in its early ripening and rich, dark appearance, and also from the fact that it is a heavy yielder. I have seen 200 barrels of this fruit gathered from a single acre, and though they were marketed in the early part of September, they found a ready sale at a good average price.

Probably there is no berry better known to growers than the Howe. It ripens about September 25, and good reports are heard from it wherever it is grown. It is a sound berry of good size, of a purplish tinge when ripe, and is valued especially for its keeping qualities. It is a very hardy variety, and it takes a severe frost to injure the fruit. The Smalley is about the same except that it is more pear-shaped than the Howe, and when ripe its appearance is apt to be mottled or spotted, but it is a good yielder and keeper, and a favorite with most growers. The Bugle or Bell berry is an old-fashioned, late variety that takes its name from its shape, and was a favorite in the days when swamps were flowed to prevent frost from injuring fruit. It ripens very late, and as it does not keep any better than the Howe or Smalley, it is fast going out of use. The McFarland is a very large, fancy fruit, and is raised chiefly to take prizes at fairs. It rots quickly either on the vines or off, and is not a very profitable kind to grow. In another article I shall describe a model screening and packing house, also how to take care of young vines, and describe best methods of harvesting.

F. A. MAKEPEACE.

ROOT-PRUNED TREES FAIL FROM DROUGHT

Mr. Stringfellow's Texas Experiment.

To prove how greatly mistaken your Mexican correspondent, H. L. T. (page 397), is in supposing that the success of root-pruning is "merely a question of latitude," I will state that my planting of 3,000 trees this year is almost a total failure from drought, while I feel confident that nearly every one set at Hope Farm as well as at Boonsboro and Coleman in Maryland will grow. It is simply a question of moisture, not latitude. New York nurserymen every year grow thousands of vines and trees from cuttings and short-piece root grafts, identical with the root-pruned tree, nor have I ever before seen a Winter and Spring so dry that a root-pruned tree would not callus and grow off readily. This immediate locality has had only a total of five inches of rain since the great storm of September 8, and of that we have only had as much as one inch at a time once. The remainder has fallen in light showers that wet the ground but a few inches. I planted my trees in driven holes about 10 inches deep in November, pouring into them about a pint of water to the hole. This of course was quickly absorbed by the thirsty earth, and since then not a particle of moisture has ever reached the roots. This applies to all but about 100 trees planted immediately along the base of the hill where the moisture has been forced up to the surface. Every tree there is growing nicely, while all on the flat 10-acre hilltop and on the valley below have failed to push a bud, and are as dead as the proverbial "door nail." But the trees set on a part of this hilltop last year, which was quite seasonable, are standing the drought bravely and a few of them have peaches on them, which, if it ever rains and they mature, I will send the editor as the first fruit ever grown on a "driven hole" tree.

As to planting orchards in this way in droughty sections like this, where the soil is rocky and the water level 75 feet or more below the surface, I give it up as too risky. The safer plan will be to plow in Summer and cultivate for two years, when the trees should be put to grass and mown, leaving clippings on the ground. As to best depth to set, two trees were planted last year in driven holes 18 inches deep, only one inch of the tops with a single bud being above ground. The trees alongside were planted from eight to 10 inches deep, and I see no difference now between them. As to my whole experiment here I will say that I moved to Lampasas only 18 months ago, from the coast country of Texas, where it generally rains too much, and while I give it up that the driven hole in sod ground is too risky for dry countries, I feel confident that the experiments now being made will prove it to be a success in all sections with a reasonable amount of rainfall. For the encouragement of those who are experimenting, I will give an extract from the report on close root-pruning by Prof. Henry E. Dosch, of the Oregon State Horticultural Department. He says:

> I procured 50 trees, one, two and three years old, of pears, apples, prunes, plums and cherries, grafted on different kinds of roots, removing every fiber from the stubs; the tops were cut off to 30 inches. The first year the trees made but a few inches growth, and I had fears, as my soil is a heavy clay underlined with hardpan, and a very dry season followed. I hoed and cultivated as if planted in orchard, but when Fall came, concluded it was a failure and paid no further attention to them. The following Spring, when preparing my garden, where they were planted, I started to pull them up, when to my surprise I could not do it. On examining the little things I noticed the buds were swelling, so allowed them to remain, and when they did begin to grow I thought they never would stop. The prune trees grew eight feet, the apple and pear trees three and four feet. The fruit growers' convention met that year in July at Newburg, to which I took a number of these trees to show the result of my experiment, and, like myself, all present were greatly astonished. The most surprising fact of all was, not the large top growth, but the perfect root system these trees had formed, all of them throwing out three or four strong roots from each stub, which struck diagonally down into the soil. Those which I exhibited at Newburg had grown roots down into this heavy clay soil over four feet, penetrating the hardpan and throwing out hundreds of lateral rootlets, but none grew near the surface, hence out of reach of the plow. A more perfect and symmetrical root system could not be formed. As to age of tree best adapted to this method, I could see no difference whatever, the three-year-old trees making the same perfect root system as the one and two-year-old. The only difference was that the three-year-old pear and cherry trees set some fruit which matured nicely.

So don't be discouraged if root-pruned trees do not do as well the first year as you think they ought to.

H. M. STRINGFELLOW.

I WANT to tell you how much your investigation of the apple crop and probable prices did for me last Fall. Buyers were around here trying to make us believe that they could almost get apples given to them in New York State. Many of my neighbors sold their crops for 50 cents per barrel; pick them and haul to the station. Acting on the advice of THE R. N.-Y. I would not sell to them, but put them in barrels and sent them to a commission man in Philadelphia. They netted me above $1 per barrel. W. W. H.

New Hope, Pa.

THE ROCKY FORD MELON DISTRICT.

REMARKABLE THINGS IN A NEW COUNTRY.

Irrigation and Alfalfa in the West.

THE MELON INDUSTRY has made Rocky Ford, Col., famous. The melons are excellent in quality, the acreage is large, the business has been well advertised. The result is that Rocky Ford is known far and wide as the most aggressive of melon-growing regions. The secrets of this success are irrigation, sunny climate, loose, rich soil. Twenty-five years ago the country was a treeless waste. Along the streams were sage brush and alkali, and on the upper lands were endless stretches of parched Gramma grass and Buffalo grass, over which the cowboys ranged the cattle. In the higher lands far away from the rivers, the country is still practically almost a desert, for the annual rainfall is only about 13 inches, and sometimes it is much less. Aside from the native grasses only Alfalfa can persist, and even this leads a precarious existence, even where it can grow at all. The country needs only water, however, to make it a garden. Here and there, on the plains that stretch away to the horizon without a tree or a bush, one may see a patch of green and he knows that water and Alfalfa are there. A grove of cottonwoods has been planted and a home has been built like an oasis in a desert.

IRRIGATION POSSIBILITIES.—In the river valleys, agriculture has great possibilities. Irrigating ditches are taken from the streams at intervals, and a water right is conveyed with every piece of land. One buys water quite as much as land. Rocky Ford is in the valley of the Arkansas, lying well towards the southern part of the plains of Colorado, east of the Continental Divide. The river supplies water in abundance, and the country is developing rapidly. One may travel much without finding a community that shows greater evidences of thrift and prosperity than this. Irrigable lands are in brisk demand at figures ranging from $75 to $200 per acre; and some of the best lands nearest the town cannot be secured for the latter figure. The soil on the "second bottoms," comprising lands that are somewhat elevated above the river, is mostly a sandy loam of several feet in depth. When properly irrigated and tilled it remains loose and friable on top, but with careless flooding it is likely to bake and harden on the surface.

EFFECT OF HYBRIDIZING ROSA FERRUGINEA. Fig. 206. See Ruralisms, Page 486.

DO NOT FLOOD.—Hereby arises a very important point in this irrigating of tilled crops, and one that may be applied wherever plants are watered: All the melon growers insist on applying the water in furrows close beside the plants, and not on top of the ground about the plants. If the water is applied about the plant, the soil puddles and bakes, the foliage is likely to be injured by the mud, and there is little opportunity to correct the difficulty by means of horse tillage. The irrigating furrow is run within three or four inches of the row of plants, and is four or five inches deep. From this furrow the water percolates into the soil beneath, and the surface of the land remains loose and open. As soon as the water has thoroughly percolated into the soil, the furrow is filled with a cultivator, and an ideal surface tillage is maintained. The novice usually irrigates too much. The "old stager" irrigates a crop of melons or beets perhaps only two to four times, but he practices the best of tillage. Irrigation enforces tillage for conservation of moisture. In the East, do we not make a mistake by watering newly-set plants on the surface of the ground? Why not make a hole near the plant with a clip of the hoe, apply the water to the hole and thereby moisten only the sub-surface?

"DON'T WANT RAIN."—It was a day in June that I visited a farmer at Rocky Ford. He was irrigating beets and orchard. It threatened rain. I asked him why he did not wait for the shower.

"I don't want the rain," he answered. "Rain is a nuisance. It packs down the earth. It makes the place muddy. It knocks down the plants and drives them into the mud. It upsets all my calculations. We have too much rain."

Although this represents an extreme view, it nevertheless contains much truth. We of the humid East have a species of commiseration and sympathy for the man who lives where there is scanty rainfall; but this man in the arid regions has a similar commiseration for the easterner who must wait for the weather. To a large degree, the irrigator is independent. He applies water when the plants need it. The thriftiness of the crops, as well as of the people, in this Arkansas Valley testify to the fact that the farmer is boss despite the lack of rain.

ALFALFA REIGNS.—The foundation crop of all this country is Alfalfa. Gradually the great open pasture ranges are giving way to inclosures, and stock is being fed and housed. In much of Colorado the general pasture range will persist for years, perhaps forever, but the tendency here, as elsewhere, is to centralize and intensify. Fifteen years ago this valley was the home of the cowboy and the pioneer. Today it is the home of the farmer, with staid and steady purposes, and the country is one of pleasant and substantial homes. With the increase of the Alfalfa acreage scientific stock raising is bound to develop. However, the second crop in importance in this Rocky Ford region is melons, particularly muskmelons, or cantaloupes as they are called here. It is about 20 years ago that the melon was first raised here, although the commercial melon industry has developed mostly within the last 10 years. Netted Gem is the variety mostly grown. It is planted directly in the field, not being started under glass, as the custom is in the East. The lands are level and easy of irrigation, and the raising of the crop has presented no special difficulties until within the last year or two, when the blight (Macrosporium, or fungus) has begun to be troublesome. The melon harvest begins early in August. According to Mr. Griffin, who has charge of the Arkansas Valley Experiment Station, the acreage of melons in 1900 was about 2,500, and 780 cars were shipped. This area is not confined to Rocky Ford itself, although all the output is popularly known as Rocky Ford melons. The area extends from near Pueblo practically to the Kansas line, a distance of more than 100 miles.

SUGAR BEETS.—This year the sugar beet is attracting more attention than any other crop. A beet factory was erected last year at Rocky Ford, and in order to secure its location a certain acreage had to be pledged. This naturally reduces the area available for melons on many farms. It is a common report at Rocky Ford that the acreage of melons is much decreased this year, sugar beets promising much surer and more direct returns. Possibly this is true at Rocky Ford itself, but recent estimates of the entire region place this year's melon acreage at 3,000 acres.

The agriculture of the Arkansas Valley in Colorado is not confined to the crops mentioned above. Fruits and vegetables are grown in abundance. It is not a corn country, as the nights are too cool, and corn can be procured cheaply from Kansas. There are good orchards of apples (chiefly Ben Davis and Winesap), native plums and to less extent of German and Italian prunes, sour cherries, and large plantations of gooseberries and other small fruits. The Winters are too cold for certain results with peaches, although I saw many trees well laden with fruit, but most of them had been laid down for protection. Pears are practically prohibited because of the blight. For a new country, the agricultural industries at Rocky Ford are remarkably varied. This means much for its future development. [Prof.] L. H. BAILEY.

ASPARAGUS NOTES FROM A. DONALD.

I see in The R. N.-Y. much said about Asparagus rust. That is something we have not yet been troubled with here in Chemung County; but for the last two seasons there has been a small striped bug, and some that are quite red, that have destroyed some beds. One man set one acre of plants one year ago, and it was eaten badly last year, and this season the insects have taken all that was left. They eat the bark from the tender shoots, to which the egg is stuck fast. They hatch out in a few days, and trim up the plant in a short time. I have a small planting in my garden put out last season; it was eaten quite badly this year. I have caught the bugs and killed them, and destroyed the slug, but I find this is slow work and all the grass is worth. I have a neighbor who put out one acre a year ago; when the insects commenced to work he used a fine sprayer with kerosene oil, and it appears to be effective, as I looked over the field yesterday, and did not see much if any that had been hurt either by the oil or beetle. Have any of the growers of New Jersey or Long Island had this trouble, and if so, what remedy do they use?

This neighbor who set the acre last Spring, 1900, had been asking me about the effects of salt on asparagus. I told him I believed it a good thing. I had used five tons to the acre with good results, so he has had some good, coarse salt, such as they use in salting green hides. He sent a boy to put it on. He spread 350 pounds on a strip 36 feet long by seven feet wide, making less than one square rod, and this was put on after the young asparagus had come up, and was growing. I went yesterday and looked over, and found the ground all white, crusted with salt, but no harm was done to the plants. You may figure for yourself how much salt there was to the acre. The soil is a sandy loam. If the Jersey growers would use five to 10 tons of salt and 100 to 150 bushels lime every three or four years might it not help to control the blight or rust? If it has not been used in such quantity try it. A. DONALD.

Elmira, N. Y.

R. N. Y.—The insect referred to is the well-known Asparagus beetle, long a pest in the Jersey and Long Island fields. It can be fought in a small way by dusting or spraying with hellebore or Paris-green after the cutting season is over. Large growers do not pay much attention to it, as, like the Cabbage worm, it is less destructive in large areas. Applications may be made whenever beetles or slugs appear. Salt is not regarded as beneficial here near the coast, but is advised farther inland. Asparagus roots very deeply, and can bear strong applications of salt.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Peach Root-Aphis.

W. F. F., Fisherville, Pa.—I have a young peach orchard one year planted. Part of the trees are seriously affected by a small black insect working on the roots. I find them in colonies on roots of trees and they simply such out their life. I never had anything like it on my farm, and I have been in the peach business for 14 years. What is the insect called, and what is to be done? Can those affected trees be saved, and can I prevent the rogues from going to the rest of the trees that are still healthy?

ANS.—The culprit is doubtless the Peach root-aphis or plant-louse, which works both on the roots and above ground on the foliage. It is a very serious pest in young orchards, but old bearing trees are not often seriously injured. Recent observations indicate that ants have much to do with the distribution of the lice from tree to tree, and other more vital relations are suspected between the ants and their cows—the lice. The lice working on the leaves readily succumb to a spray of whale-oil soap or tobacco water, but the more destructive root-feeding forms are difficult to reach. The best results seem to have been attained by digging in liberal quantities of fine tobacco dust about the bases of infested trees. If there are ants in noticeable numbers in the soil in the orchard they will doubtless soon carry the lice from infested to healthy trees. Carbon bisulphide is too dangerous to use in the soil at the base of the tree, and solutions of soap and tobacco poured around the base have not been effectual. Keep the trees well fed and cultivated, and use tobacco dust freely, and it is probable that the trees can be carried through their youth and get growth enough so that the lice will not noticeably injure them as bearing trees. One should always carefully examine the roots of peach nursery stock for these dark brown plant-lice, and if any indications of their presence are found either destroy the stock or dip it in a strong whale-oil soap solution, or better still have it fumigated by experts or reliable persons. M. V. SLINGERLAND.

Woolly Aphis on Apple Roots.

J. W. W., Woodford Co., Ky.—I send some kind of insect that is on roots of apple trees in my nursery. What will kill them while trees are standing in nursery rows without hurting the trees? Are they the Woolly aphis, and will they hurt trees to amount to anything? Are other nurseries subject to them?

ANS.—The apple roots bore many genuine Woolly aphids or plant-lice. This insect is a dangerous pest in a nursery or young orchard. No nurseryman should send out trees thus infested, and the orchardist should keep a sharp lookout that he does not get trees infested with Woolly aphids. They are a difficult pest to handle, and it is a case where an ounce of prevention is worth many pounds of trying to cure. Liberal quantities of tobacco dust dug in around the base of the trees has given the best results thus far reported, and there is no danger of its injuring the trees, but it would be rather an expensive operation in a nursery. I would root out and burn all infested trees, and grow some other trees, like peaches or plums, which the pest does not attack, in their places. I would rather stop growing apple trees for a time than to send out infested trees. Destroy all trees where roots are badly knotted by the lice, and fumigate all others thoroughly before selling. M. V. SLINGERLAND.

A Talk About Plant Lice.

E. D. A., Poughkeepsie, N. Y.—Is any remedy known for the insects like lice now infesting maple trees, covering the leaves with a glaze which causes them to fall?

ANS.—Plant-lice of all kinds seem to be much more numerous this year than usual. To combat them successfully one must understand how they eat. They do not have jaws for biting off pieces of food, like the Potato beetle or a caterpillar. Their mouth parts are drawn out into a beak with which they suck the sap from the interior of the plant in a way similar to that by which a mosquito sucks the blood from us. Therefore one cannot fight these sucking insects with Paris-green or similar poisons, by putting it on the surface of the plant, nor is it possible to inoculate the plant with any substances which will go into the sap and thus be taken up by the insect. Such sucking insects then can only be killed by actually *hitting* them with a spray of a soap or an oil which will either close their breathing holes or soak through their skin. The fact that we have to aim our spray much more accurately in fighting sucking insects makes it a very difficult matter to kill them, and this is especially true where they infest such large-leaved trees as the maple. It would not often be practicable to spray a maple tree for these insects. However, I find that the enemies of plant-lice are now fast getting the upper hand, and millions of the lice are being included in the daily menu of ladybird beetles and their other numerous enemies, so I think that in a short time the maple trees will probably be relieved of most of the tiny pumps which are now sapping the life from the leaves. M. V. SLINGERLAND.

Seventeen-Year Locust; Watermelon Bug; Strawberries.

W. E. B., Romney, W. Va.—1. What effect will the Seventeen-year locust have on young peach trees one year old, also on trees set the Fall previous to locust year? If they have a bad effect would spraying help to protect the trees at time the locusts are on trees? 2. I have been troubled several years with the Watermelon bug, and have used several preparations. All seem to be detrimental to the vine. What is the best thing to do? 3. Can you set strawberries out in September and get a good crop the following Spring?

ANS.—1. The Seventeen-year locust is capable of doing very serious injury to young orchard trees; trees set the Fall previous might be killed, and one-year-old trees so maimed as to ruin their symmetry of growth. But usually such injury occurs only when the locusts appear in very great numbers, and in the near neighborhood of the orchard. The injury is done by the female locust in depositing her eggs, which she prefers to do in slits cut into the tender growth of young trees. As serious injury to young orchard trees by this insect is of comparatively rare occurrence, I would never hesitate to set trees at any time in regions where the locusts are scheduled to appear. But I can suggest no practicable method of preventing the locusts from laying their eggs in the trees. One cannot feed them a poison, as they suck what little food they may eat, and I do not think any substance sprayed on the bark would prevent them from ovipositing. Possibly a good coating of crude petroleum applied in early Spring might have some deterrent effect, but I would not depend much on it. It would probably require so strong an oil or a soap spray to kill the locusts that it would also seriously injure the trees. 2. I am not quite sure what insect is called the "Watermelon bug" in West Virginia. If it is the striped beetle, thorough work with the Bordeaux Mixture has been found very effectual. But the "bug" may be an entirely different creature, perhaps a sucking insect. 3. A strawberry expert tells me that if one sets potted strawberry plants in September a fairly good crop of fruit may be raised the following season. But with ordinary runner plants one should not expect to let the vines bear much the next year. M. V. SLINGERLAND.

Plant Lice on Apples.

E. M. M., Irving, Ill.—Enclosed find leaves taken from an apple tree in my orchard. Will you tell me with what the leaves are infested?

ANS.—The apple leaves were infested with plant-lice or aphids. These little insects suck the sap from the inside of the leaves, hence one cannot feed them a poison spray, but each louse must *be*

CHILDS'
SO-BOS-SO
KILFLY

Cows Will Give From 15 to 25 Per Cent. More Milk

and better milk if protected from Flies by the use of CHILDS' SO-BOS-SO KILFLY.

It is a thorough fly killer and germicide, destroys all bacterial germs, insures health, greater strength and vigor to the animals, and by the absolute relief afforded to them increases the amount of milk $8.00 to $10.00 per cow during the season, making it a first-class investment. It allays nervousness in horses as well as cows, and keeps both in better general condition by the comfort it gives. As an antiseptic and for scours in calves, hog cholera, swine plague, and foul in Cattles' feet it is unequaled and may be used either in the stable, cow-shed, chicken house or pig pen. It is easily and rapidly applied with Childs' Electric Sprayer, and a herd of 30 to 50 cows can be sprayed in a few moments. Prior to the invention of SO-BOS-SO KILFLY and the Electric Sprayer there was nothing on the market that would successfully combat the annoyance and loss occasioned by flies and insects. SO-BOS-SO is absolutely harmless to man and beast. Abortion in cows, which is caused by a germ—propagated by unsanitary conditions—can be prevented by the use of SO-BOS-SO KILFLY.

Sold only in gallon cans. Ask your dealer, or send $2.00 for one gal. can and Electric Sprayer complete, securely packed and express paid to any point east of Mississippi river except State of Maine. The sprayer can also be used for spraying potato vines, bushes, trees, etc. Beware of imitations.

CONVENIENT. CHEAP. PRACTICAL.

Thousands are in use in America, Canada and Mexico. Shipments have begun to Cuba, the Philippines, South America and Australia.

The following testimonials speak for themselves:

PITTSFIELD, MASS., April 28, 1900.
We have found the So-Bos-So Kilfly to be an excellent article doing perfectly the work intended. Our customers report that it protects the cattle from flies very thoroughly, and consequently increases the flow of milk. Another great point in its favor is that it is reasonable in price. In some instances, it has been used quite extensively on horses. One of our customers wishing to photograph his team found it necessary to use So-Bos-So Kilfly with successful results. HOWARD & MORROW.

MUNHALL, Allegheny Co., Pa., July 7, '99.
I received the So-Bos-So Kilfly and Sprayer and am very well pleased with it. I have a herd of 27 cows, and when we put them in the stable to milk these hot evenings, flies torment them very much, but a few minutes with the sprayer and all is quiet, and we can then do our milking in peace. JAMES C. KEARNEY.

PHILADELPHIA, PA., May 2, 1900.
Last July the daily quantity of milk produced by my Chester County dairy fell off very considerably, which I attributed to the annoyance which the cattle received from the flies. About half the time the herd was standing in the stream switching instead of grazing. I ordered a sample of So-Bos-So Kilfly and by having it applied every second morning, greatly relieved the herd and increased the milk product from 15 to 25 per cent. and I have continued to use So-Bos-So Kilfly during hot weather ever since that time. Our herd of about 20 head could be sprayed in the stable in less time than it would require to milk a single cow, and I consider that I have saved many times the cost of the So-Bos-So Kilfly used, in addition to affording comfort to the herd. G. S. W. BRUBAKER.

LOWELL'S STATION, PA., April 18, 1900.
We can highly recommend So-Bos-So Kilfly as by keeping off the flies it increases the flow of milk and insures comfort to the cows. If So-Bos-So Kilfly is used on cattle during the summer, it will undoubtedly keep them free from lice and scurf during the winter.
C. F. MCCRAY & SON, Maplewood Stock Farm.

LENOX, MASS., April 21st, 1900.
I have used So-Bos-So Kilfly with good results. It is a comfort to both man and beast at the milking time.
JACOB STEIBEL, Supt. to the Hon. John E. Parsons.

CHAS. H. CHILDS & CO., Sole Manufacturers, 12 La Fayette Street, UTICA, N. Y.

hit with an oil or a soap spray to kill it; a strong tobacco decoction will also kill them. Usually this Apple aphis does not do much damage in large trees, but small trees may suffer noticeably, and thus need to be treated. Spray thoroughly, aiming at the lice, with whale-oil soap, using one pound in five gallons of water. M. V. SLINGERLAND.

A Grist of Fruit Questions.

S., Woodlawn, Va.—1. I have seen a number of apple trees where the ends of the limbs were dying, which I think is caused by some kind of insect. Is there any remedy to prevent this? 2. Please advise the best method of planting and cultivating apple, peach, pear and plum seed. 3. Can you recommend some western nurserymen who can furnish grape cuttings, apple and pear scions, also seedlings? 4. Is there any special machine for digging and transplanting nursery stock? 5. What do men generally charge for budding nursery stock, and how many trees can they bud a day? 6. What is the duty on about 15,000 seedlings from France?

ANS.—1. It would be quite impossible to tell what is the matter with the trees mentioned, as there are a great many insects that trouble apple trees. However, it might be that the damage mentioned is from the eating of the foliage by the Spring canker worm. If so, the damage is practically over now, that is, the insects have done their work and gone into the ground, but next Spring the trees should be sprayed with an arsenical preparation as soon as the leaves begin to come out, so as to cover them with poison, and in the end poisoning the little worms which will hatch out from the eggs laid by the insects and crawl up the trees in the Spring. 2. Briefly stated, these seeds should be planted in the late Fall, or very early in the Spring. In the latter case they should be kept over Winter in moist earth, so that they will not heat, and yet they will keep moist, fresh, plump and in good germinating condition. They should then be planted very early in the Spring. As to cultivation, they should be kept just as clean as possible, and the ground loose. The planting should be in rows about two feet apart, so that they could be worked either by horse, or by hand. 3. Almost any nurseryman in any part of the country can furnish cuttings of the crab apple and pear, and many of them seedlings also. You can observe the advertisements in THE R. N.-Y., and correspond with those whom you think best. 4. There are good machines, or tree diggers for digging nursery trees by horse power, and I know at least one nursery that uses steam traction for pulling the tree digger, which seems to work very well. 5. Budding is done by the day, and a reasonable price for an expert would be $2 or $3 per day, provided he can set about 1,500 or 2,000, with a tier to follow who should do the tying at the cost of the owner of the stock, and, of course, be paid extra. If the budder does his own tying he could not, of course, put in so many, and about 1,000 would be a reasonable number for a day's work. There are those who can exceed this, but they are hard to find, and sometimes their work is not satisfactory. One of the main things is to do budding so that the buds will take. It is not so much the number of buds put in, but to make sure that the buds will succeed, as anyone can easily see would be the proper view to take of the matter. 6. The duty on seedlings from France, or any other country, is 20 per cent of their value.

H. E. VAN DEMAN.

Harvesting the Onion Crop.

Reader.—Will some onion grower tell how the onion crop is handled in the field?

ANS.—The thorough farmer has no weeds in his onions when harvest time comes. A clean field adds greatly to the pleasure and economy of harvesting the crop. White onions should be pulled as soon as fungus spots begin to show on the outer leaves. Pull three rows at a time, and lay together straight, with the tops all one way. Let them lie 24 hours if good weather before piling. Two forms of piles are used here, the small round pile and the long pile. For the small pile make a square bottom of barrel staves or boards nailed to cleats. It will be the square of the length of a barrel stave. Pile three windrows or nine onion rows into one row of piles. Grasp a large handful of onions by the tops and set them on the barrel stave platform with tops outside and so on around, leaving a six-inch air shaft, and drawing in near the top. Keep the onions in and tops out. Bring the tops together and point up in a conical or old-fashioned beehive shape. Some weeds or a fertilizer sack held on with stones finishes the pile. Such a pile will cut out from one to two bushels. The long pile is made by nailing four or five four-inch fence slats upon cross cleats. On these the onions are piled, with bulbs in and tops out, drawn in at the top, making a pile 2½ feet high. One of our neighbors goes further than this, and puts a slat rack through the middle, so that the air can have free circulation endwise through the pile. Another plan where one has barn room enough, is to cart in in barrels the day after pulling, and leave the onions in barrel dump piles in rows on the floor. These rows of piles give an opportunity for the circulation of air between. After a few days these piles are turned over into new piles or ridges.

Red and yellow onions require less care than the whites, and some growers pull them into 12-row windrows and let them lie there for a month, raking them over for a day or two, if good weather, before carting. But a brighter onion can be made by piling into small piles preventing sunburn and weathering. One of our inventive farmers has patented a pulling attachment to a wheel hoe which works well in clean ground, and by it onions are loosened rapidly row by row and then raked into windrows. Weeds should be cleaned off as soon as the onions are pulled, if there are weeds. A good horse hoe for this purpose is made from an old saw blade or similar piece of steel about three feet long, having the ends turned up and fitted for the rear holes of a wooden horse cultivator. The blade should be sharp and dipped enough to take hold. The forward feet of the cultivator may be removed. It would be difficult to give a hard and fast rule for grading onions. The pickles are the little fellows, finger-end size. The seconds, those go-betweens, so big that you are ashamed to have them in the pickles and so small that you are ashamed to have them in the big ones. Any rule of diameter would be rather difficult of application.

E. C. BIRGE.

Devices for Manure Cleaning.

Many people throughout the country are thinking of building new barns or making over old ones, and they want to put in the conveniences, both labor-saving and sanitary. Among other things there is a great demand for some automatic or other device for getting rid of the manure. The ordinary plan of handling it with a dung fork and throwing it out of the window by the cows is not at all satisfactory. What in your judgment is the best advice to give a man who wants either an automatic or some other labor-saving device for handling liquids and solids?

You ask for some good automatic device by which the manure may be taken out of the stables. I know of none that is entirely satisfactory. Some use grating through which the manure is supposed to fall into a pit below, but the gratings become clogged, befouled and filthy. Bad odors and cold drafts of wind come up through them, which is bad for the milkers and worse for the cows. Some flush the gutters with water with the idea of washing out the manure, but this is expensive and wasteful of fertilizers. Where many animals are stabled there is probably no better way than to have stables so arranged as to drive through with manure spreader, wagon, cart or sled each day, and convey the manure to the field. Where a smaller number of animals is kept a manure carrier made to run on a track can quickly be filled and sent out to the covered barnyard, or dumped into a cart outside. These carriers should be made with drop bottoms that may be operated by a rope or wire from the stable. We have fitted up barns in this way, and they are very satisfactory.

On our own farms the cow stables are cleaned out twice a day and collected in the covered barnyard, whence it goes to the field in February, July or December. The manure from the horse stables, the stables being large box stalls, is hauled directly to the fields when they are in condition to receive it—that is, in condition for driving over them. If the fields are unfit to drive over the manure is then wheeled out into the covered barnyard to await the general cleaning up, the object being always to produce just as much manure as possible. Much refuse matter of various kinds that is burned up on many farms we consign to the manure yards to be converted into manure. The tenant is charged not to burn the rakings from the yard or garden, but to cart them to the manure yard.

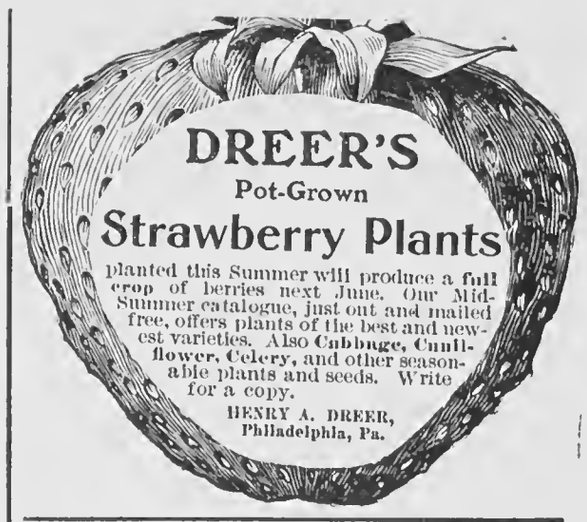
JOHN L. SHAWVER.

Ohio.

Notes on the Cowhorn Turnip.

The Cowhorn turnip has been a standard sort in our list of table varieties for a number of years, but we have never had it to grow to anything like the size of those spoken of in a recent issue of THE R. N.-Y. in our trial grounds, where it has been planted and grown under ordinary conditions. We would say that the average length of well-grown turnips of this variety in good soil would be seven to eight inches, tapering in form, and usually curved or one-sided, hence the suggestive name, with tops of rather greater length. Regarding its keeping qualities, we would say that the flesh is firm and solid, but we do not think that it has the keeping qualities of the ruta baga, as it is distinctly one of the rough-leaved turnips. We do not think the keeping qualities enter into the plan of green manuring, as the chief requisite is to secure a large and quick growth of vegetable matter to turn under, and this would probably be one of the best varieties for this purpose, as the long roots will penetrate the soil more deeply then the globe-shaped or flat-rooted sorts. As we understand it, the crop can either be turned down late in the Fall or allowed to die down for Spring plowing. In our climate and farther north we should prefer to turn them under just before the ground freezes, so as to secure the greatest benefit from the decay of the vegetable matter which is to enrich the soil. Harvesting them for Winter feeding is, of course, a different matter, and we would prefer a larger globe-shaped root for this purpose. You will be interested to know that we have had considerable demand for this variety this season, in all probability due to the articles in the agricultural press and State bulletins.

W. ATLEE BURPEE & CO.



Beautiful Strawberries in 1902

We can furnish you with pot-grown Strawberry Plants that will bear a full crop of fruit next year. Celery and Cabbage Plants. Full line of Fruit and Ornamental Stock. Write at once for our Summer and Autumn catalogue. It explains all. Fruit packages of all kinds for sale at low prices. T. J. DWYER & SON, Orange County Nurseries, Box 1, Cornwall, N. Y.

Plants—Pot-grown Strawberry, Celery and Cabbage. Thousands of them. See our price-list. CALEB BOGGS & SON, Cheswold, Del.

Ginseng Stock for Sale. My own growing. Orders booked now for delivery September 1. Send stamp for catalogue. GEO. MUDGETT, Johnstown, Pa.

CABBAGE PLANTS

Leading varieties, 75c. per 1,000. Shipped safely anywhere. A. B. KATKAMIER, Macedon, N. Y.

CELERY Plants, $1 per 1,000. Large, stocky Plants, grown by irrigation. *Send no money* until you see the plants. I ship C. O. D.; carefully packed F. W. ROCHELLE, Chester, N. J.

CELERY and Cabbage Plants only $1 per 1,000. 100 Strawberry Plants in pots for $1 Crimson Clover Seed of our own growing. Catalogue free. SLAYMAKER & SON, Dover, Del.

Celery and Cabbage Plants for Sale

Leading varieties, carefully packed with moss in baskets, f. o. b. here. 250 plants at 60c.; 500 for 90c.; 1,000 for $1.50. Special price on quantities over 6,000. Cash with order. Plants ready 15th to 20th of June. WOODLAND FARM, Canastota, Madison Co., N. Y

CELERY PLANTS.

Grown by the acre, on fine irrigated land. Extra large root development. Large stocky plants Shipped safely to all parts of the United States and Canada. White Plume, Golden Self-Blanching and Giant Paschal. Price: 500, 75c.; 1,000, $1.25; 5,000, $5. WILSON BROS. & CO., Tecumseh, Mich.

CELERY PLANTS.

Field-grown, healthy plants, sheared back several times. White Plume, Heartwell Perfection, Dwarf Golden Heart and Celeriac Erfurter. Price, 500, 75c.; 1,000, $1.25; 5,000, $5. Write for prices on 25,000, 50,000 and 100,000. Cash with order, please. LUDWIG MOSBAK, 8500 Anthony Ave., South Chicago, Ill.

BINDER TWINE

It affords us great pleasure to quote prices for our famous and well-known grades of binder twine as follows:

Pure White Sisal, 8c per lb. 485 to 515 feet to the pound. **Standard, 8c per lb.** 485 to 525 feet to the pound. **Manila, 9¾c per lb.** 580 to 615 feet to the pound.

These prices are for any quantity not less than a 50-pound bale, free on board cars Chicago, and are not subject to discount. TERMS:—Cash to accompany order.

The above twines are our unexcelled "SMYTH" BRAND, pronounced by all who use them to be the best in the world. They are prepared with special care from first quality selected hemp, every ball being separately tested for evenness and tensile strength and insect prepared before being allowed to pass examination, hence it is absolutely perfect, and we believe it to be worth 2c per pound more than any other binder twine.

WE GUARANTEE our customers against any change in our price and if we go lower, you will be refunded the difference in price. We treat all our customers alike and the early buyer is afforded as much protection as the late one.

SAMPLES FREE. We guarantee our twine, every pound of it, and we will refund your money instantly and without a question if it fails to come up to our representation either in quality or count, but if you prefer to see samples before ordering, write us and we will send samples so that you can see and test it. **JOHN M. SMYTH CO.** 150-166 and 287-289 W. Madison St., CHICAGO.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

THE LOCAL STRAWBERRY SEASON.—As experienced growers predicted at blooming time the local strawberry crop is short in quantity, but of fair quality. The rains were so incessant that one wonders how pollination was effected at all. The sunny intervals were so few that the bees had little chance to transfer pollen from staminate to pistillate blooms. The anthers of the best of perfect flowering varieties are not very conspicuous, but they liberate a great quantity of very diffusible pollen when they are dry enough to burst, and it is quickly carried to neighboring imperfect blossoms by various insects, and possibly to a limited extent by the wind. Prolonged wet weather, lasting without intermission throughout the life of many blooms, without doubt greatly reduces the chances of pollination of the seed ovules, and the consequent development of the strawberry "fruit," which is really the fleshy and swollen end of the pedicel supporting the seeds, always considered by botanists as the real fruits of the plant. The strawberry, however, has quite an extended period of bloom, and a considerable number of blossoms is likely to reach the receptive stage between rains even in the most trying seasons, and the result, other conditions being equal, should be a light crop of well-developed berries. This fairly represents the present condition, which is equalized to a greater degree, from the grower's standpoint, by the receipt of fair prices for well-graded berries. The worst general defect is a prevalence of sunscald, as the cool moist weather before the blooming season did not favor the development of dense foliage, and the ripening fruit has been unduly exposed to the sun.

The Gandy leads all varieties in this district, and is still more largely planted than any other, though the Michigan, Bubach and Wm. Belt have their advocates. Early berries are practically not grown for market, the southern product having captured the trade exclusively, but varieties later than Gandy, presenting as good appearance when boxed for market, are earnestly desired, but so far none has made headway with growers. Quality does not count much with a market berry, but color, size, firmness and uniformity are important factors, ranking only with productiveness and reliability. Commercial strawberry culture has long been a recognized industry in Monmouth Co., N. J. Hovey's Seedling was grown for the New York market 50 years ago, and was most highly regarded as the first valuable native berry produced by scientific hybridization. Following the Hovey came the famous Wilson, generally known at the time as Wilson's Albany. This was probably the most productive of all strawberries, and old growers tell of large fields visibly red at a distance from the vivid color of the abundant fruits. It was firm and a good shipper, but sharply acid, and of low table quality. These noted old varieties have entirely disappeared from northern fields. It would scarcely be possible to find a typical plant of the Hovey, and the Wilson practically survives only in the tough and viciously sour early berries sent up from the far South during the late Winter months. Jersey berries are still grown under the name of Wilson, but they really seem to belong to some of the many kinds that immediately supplanted that prime old favorite. The Bubach had a long sway, but is now being discarded in favor of the popular Gandy. Of the legion of new kinds that gained more or less favor in their day Jersey Beauty and Sharpless stand out prominently, the former for fine appearance and good market quality, though of small size, and the latter as a standard of table quality, though to many palates it is rather insipid. Sharpless, however, was one of the first large-fruited varieties to have a real sugary flavor, in distinction to the acidity supposed to be characteristic of the strawberry. It had several good points, and is still prized by many, but its poor color and irregular form have nearly driven it from the market. Gladstone, widely advertised as a great improvement on Sharpless, has not proven so in this locality, being generally unable to bring its crop of berries to perfection. Growers who properly cared for their planting during the dry weather last year, and provided a fertilizing mulch to carry the crowns through the sharp, dry, February winds, that did such extensive damage, have not found their investment altogether unprofitable, but the careless growers who took their usual chances are getting low profits, as poor berries are not wanted this season.

HYBRIDIZING WILD ROSES.—Our prized garden and glasshouse roses are, of course, descended from the various botanical species dispersed over the northern temperate zone. Roses have been cultivated from such ancient times that all record of the origin of many favorite types is lost, while others are so involved in a maze of hybridity that their parentage is undecipherable. There is now a tendency to utilize hitherto neglected species by combining them with highly improved garden forms, with the hope of getting new and distinct features. Much work of this kind is done on the Rural Grounds with results often interesting, if not valuable. Our native wild roses are very fixed in their type, and resist for at least two generations the influence of foreign pollen, though if they continue to produce viable seeds it is likely that a break will occur sooner or later, and a hybrid result showing characters of both parents. One old species that seems to have been little used is the Purple-leaved rose from the mountains of northern Europe, Rosa ferruginea. This species is very hardy and long-lived. In congenial soils it grows tall and strong. The foliage is dense and rich purple in the Spring, becoming dark green as the season advances. The flowers are borne in clusters during June. They are deep-pink in color, and pleasantly fragrant. The Purple-leaved rose is only planted in backgrounds for the color effect of its foliage or as a botanical specimen, and is consequently rarely seen. We have industriously hybridized this distinct wild rose with the best accessible garden forms for several years, and have grown many seedlings, none of which has shown the slightest variation from the type except the double rose on the right in Fig. 206, page 483, the type species being shown on the left. The pollen parent of the hybrid rose was Magna Charta, an excellent hardy variety bearing large, highly-scented, bright pink very double blooms. As will be seen the new kind is densely double, with petals of great substance, lasting a long time both when cut or on the plant. The color may be described as a silvery rose, intermediate between the parents, and the fragrance is also characteristic and pleasing. The foliage is bronzy purple, very dark when young, but turning green sooner than the parent. An odd feature of this hybrid is the almost total absence of thorns. The new shoots for the first season are as smooth as a willow wand, but the blooming branches thrown out next Spring usually have each a few small thorns. Both parents are densely covered with sharp and persistent spines. As the old blooming canes of the hybrid may be cut away each Fall the bush is no more objectionable during Winter than a currant or lilac. This new rose, from its compact shape, durability, pleasing color and fragrance, together with its known hardiness and absence of thorns, would seem to be desirable for general planting, but it has the defect of not propagating readily. W. V. F.

The Lawrence Pear.

A correspondent complains about the premature ripening of the Lawrence pear, also of its not being a profitable market variety on account of shy bearing. The premature ripening was caused by long continued hot and dry weather, which caused mine to begin to ripen in September, fully six weeks ahead of schedule time. Other late pears were less affected by the heat and drought. The shyness of bearing is probably a result of being planted in a soil unsuited to its requirements, and also a bad location. My own experience with it has been variable and unsatisfactory; because some trees would bear heavily, while others would have few fruit, or none at all. Unlike the Bartlett and Flemish Beauty, it responds well to shallow Summer culture. A noted pear grower says that it is the most profitable variety he has, but his soil and elevated location are especially adapted to the Lawrence. He reports crops that are double the amount of mine that are in a heavy clay soil. He gets more than twice the price for the Lawrence that he does for the Bartlett. The good points of the Lawrence are good color, fine quality, very hardy in tree and fruit buds; no regular off years of bearing, like the unrivaled Anjou; a heavy bearer if planted in a suitable soil and location, and holding its leaves until very late in the Fall, which feature I claim accounts for all of the foregoing good points. F. F. WOODSIDE.

Ohio.

The Ruby Queen Rose.

The thousands of Ruby Queen rose plants distributed to subscribers last year have had their blooms delayed, in common with all varieties, by the late Spring, and July 4 finds us in receipt of so few blooms for competition that it is best to postpone the award of $25 in prizes until July 15, 1902. The plants will have gained additional vigor by another season, and a fairer representation may be expected from all parts of the country.

A few errors in labeling have been reported, which will be made good by forwarding the true variety as soon as they can be safely propagated. In the preparation and mailing to individual addresses of such an immense number of young plants a small percentage of errors is almost inevitable.

The growers of Ruby Queen think that the color of this charming rose has become lighter this season than when it received its somewhat misleading name and that there is a tendency to sport back toward its seed parent, the white-flowered Rosa Wichuraiana. This would be very unusual in a true rose hybrid but if the original bright, clear carmine tint lightens under repeated propagation there would appear to be no help for it. A bright and beautiful rose, hardy, healthy and reliable would still remain. The Rural Grounds plant has shown no change, and is a dainty specimen, admired by all visitors in competition with the finest roses the world has yet produced.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

Hope Farm Notes

I meet people here and there who have some odd notions about Hope Farm. Some of them say openly that they do not believe there is any such place. They say without any reserve that it is all an imaginary picture. Others say there may be a farm, but they are not sure of it. It may not be out of place for me to answer here some of the questions that are frequently asked.

Where is Hope Farm?

In Bergen Co., New Jersey. Our post office is Woodcliff. The farm is nearly two miles from the railroad, about eight miles west of the Hudson River and four miles south of the New York State line.

How large is the farm?

The deed calls for a little over 87 acres.

Is it all in one block?

No, the deed describes three pieces. One is a long narrow strip of 50 acres. There is also an oblong strip of 30 acres, and an irregular piece of seven. The last two strips join at the corner, but the larger strip is separate.

Is it all tillable?

No. There are 25 acres or more of good chestnut timber, and 12 or 15 more grown up to brush and briers. Several other acres are so rocky that they cannot be plowed readily, and there is one low field below a spring that is used as a pasture.

What is the character of the soil?

It varies greatly. The buildings are grouped at the lower end of the long 50-acre tract. The soil here is strong and heavy, but was set out years ago in early apples and in pears, so that it cannot be used for other crops, to which it is well suited. There is a gentle rise up the farm from the road for about 600 feet, where a ledge of rock comes close to the surface—cropping out in places. Beyond this is a little valley or depression, which receives the wash from several farms to the south and also the water from a large spring. Beyond the spring the ground rises abruptly to the west to form a high hill, and then slopes down more gradually to the woods. The soil on this large tract is strong, with a fair amount of clay. On the hillsides there are places where the ledge comes close to the surface, or even crops out.

Is the land stony?

Very. Former owners picked and piled the rocks and stones until there are over three miles of stone walls bordering the farm. The lower part has been quite well cleared, but the upper hills are covered.

Why did you buy such a rough and unpromising place?

I do not call it unpromising. Others did so, and therefore the price was made low. I thought it was a bargain, and we were situated so that we had to live on a farm.

What did you pay for it?

That is a personal matter, but I have no objection to stating that the farm cost us $4,500. It was in the hands of a firm of lawyers who had acquired the property under foreclosure. I may say here that the farm is assessed at $5,500. The buildings are good and quite convenient.

Why was the property not bought? There is usually good reason when farm property stands still—without buyers.

It think the chief reason was that there was no water at the house. For some reason former owners had never provided anything but cistern water. Drinking water had to be brought from the distant spring. We drilled a well down through the rock, and this gives us a constant supply of the purest water, which is piped to house and barn. This is but one of the "possibilities" I have mentioned. The failure to utilize them hurt the reputation of the farm. When they are developed the farm will gain more of a reputation than it deserves.

What are some of the other "possibilities?"

The chestnut timber in the woods will with care provide a steady income. We have already sold over $500 worth of poles—taking the larger trees out, so that the smaller ones can make a better growth. There will be, I think, a yearly income of several hundred dollars without injuring the woods. The little valley below the spring can, I am sure, be drained. Open ditches will relieve the surface wash from other farms and stone drains or tile will make the soil fit for early crops. I feel quite sure that we can scrape out a fair-sized pond below the spring, and thus hold the water stored up for irrigation when needed. In this way the lower part of the farm could be made very productive. There is also water enough from the spring to run a small power if desired.

What do you expect to do with the farm?

I have not yet fully decided. We raise the ordinary crops while studying the soil and its needs.

Haven't you any plan?

Only in a general way, because I do not yet fully understand the farm. We have owned it but two years. I do not feel like making permanent plans until we know what is best for it. There are about 250 apple trees from 20 to 40 years old. They were neglected when we found them, but have responded so well to culture and care that I feel sure the land is well suited to fruit. At present I expect to work the hill above the spring and the western slope into an apple orchard.

What varieties?

My belief is that such varieties as Baldwin, Sutton Beauty, Russet and Greening will pay best. I shall experiment with York Imperial and Rome Beauty. We have top-worked about 50 trees to some of the newer varieties for trial. On the upper part of the 30-acre strip I would like to grow peaches. We have already set out 600 peach trees on the Stringfellow plan.

What did you do that for?

Because I wanted to give the matter a fair trial. If it will work up here I can see great chances in it for some of our waste hillside land.

You want a fruit farm, then?

That is my idea at present, because this rough and rocky location seems well adapted to trees. We raise fair crops of potatoes, corn and hay, but the shape of the fields and the lay of the land will not permit the most economical working of such crops. I believe many farmers have failed by trying to force a farm to yield crops which were not suited to its soil or conditions. While one is bringing an apple or peach orchard into profitable bearing there can be no regular rotation of crops, but a farmer must do what he can as time goes on. There are dozens of things we would like to do. We hear of people who make great fortunes out of hens, ducks, asparagus, currants, strawberries and other products. We have paid expenses and a little more with some of these things, but the great profits in any of them seem to go to the few who have some special knowledge or location, or some very favoring circumstance to help them out.

Then you do not believe it possible to make a great fortune on the farm?

I have never made one. I do not see any in sight, nor do I know of anyone who has made a vast amount of money on a fair-sized farm. At some distant day I think land in our locality will increase greatly in value for building purposes. I shall not wait with folded hands for this time to come, but shall do my best to make Hope Farm valuable for its *earning* capacity.

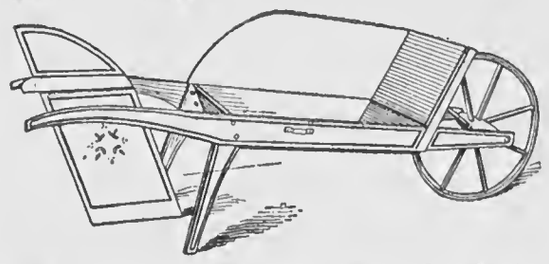
FARM NOTES.—I have written more than I intended about this. All farmers ought to be interested in the future of their farms. One reason why I like an orchard farm is the fact that the labor spent on it is work of a permanent character. I look upon a thrifty and well-selected apple orchard as about the noblest monument that a man can leave behind him. . . . A hot wave came upon us during the last days of June. It was awful—on man and beast alike—though the old stone house was quite cool. We are not yet suffering from drought, for our soil retains the moisture well—with surface cultivation. . . . The Potato beetles came out suddenly this year. Almost before we knew it they had stripped whole plants down to the stems. With the Eclipse pump mounted on the market wagon and the three nozzles aimed behind there was wholesale slaughter of the bugs. This year we tried the experiment of adding a pound of Paris-green and a pound of Leggett's Fungiroid to each barrel of water. The Fungiroid is supposed to be a dry Bordeaux Mixture, to be blown dry upon the plants. This combination quickly put an end to the bugs. There are evidences of the copper on the leaves, but we have had practically no blight this year, and I doubt whether spraying would pay. Our potatoes are at the top of a wind-swept hill, with good drainage for air and water. . . . I receive so many letters about making Bordeaux Mixture that I want to give our soda-Bordeaux formula once more. Take a one-pound can of Lewis lye and dissolve it in water. Then dissolve three pounds sulphate of copper. It can be put in a coarse sack and hung in a bucket or barrel of water. Add five gallons of water to the lye, and 10 gallons to the copper solution. Pour them together into a barrel and add enough water to make 30 gallons. Four or five ounces of lime made into a paste may be added and well stirred in. This costs more than the lime Bordeaux but it sprays well and does effective work. In spite of all that the experiment stations have printed about the Bordeaux Mixture I find many farmers who say they have tried to make it with lime and failed. H. W. C.

Opposed to the Centralized School.

I wish to speak about the carrying of children to the center or village to school. There being so few pupils in some of the districts in our town some are transferred to other districts. One of the carriers is a little girl about 10 years old, and she has tipped over once to my knowledge, and as they have a somewhat spirited horse it is a wonder some of the children were not hurt. Another of the carriers is a man who seldom is without a smokestack in his mouth. We are very thankful our children do not have to go on any of these routes. We are thankful that we do not live in a village (just on account of our children), with its cigarette smoking crowd lounging around, teaching children to be smart, etc. But if they are going to be carried to the village to school, we would much rather live in the village than to have them carried from one to three miles twice a day, crowded in with all sorts and conditions. We believe the best place for a child's morals (and perhaps for its parents, too), is under the eye of its parents as much as possible. Superintendents of schools and some others are clamoring for a big school at the center, so that it may be graded and have better schools. Suppose Abraham Lincoln, David Livingstone and D. L. Moody had been carried to the center of town or graded school, would they have been the men they were, do you think?

New Braintree, Mass. J. T. S.

WHEEL BARROWS.



Flat hickory spoke, 22-inch wheels, shrunk steel tires, one inch wide. Strong enough for heaviest load, light enough for the boy's use; nicely painted, and an ornament to your premises. Price $3.50, direct from factory. Hickory spoke wheels alone, fully ironed, $1.25 each. The boys can make the bodies on rainy days. DON A. GILBERT & CO., Bainbridge, N.Y

Blizzard Feed and Ensilage Cutter

And Dry Fodder Shredder with pneumatic or wind elevator, all combined in one machine. Fully guaranteed. Catalogue had by addressing

Joseph Dick Agricultural Works, Canton, Ohio.

BALES 15 Tons a Day HAY

The Gem Full-Circle Baler, lightest, strongest, cheapest baler. Made of wrought steel. Operated by 1 or 2 horses. Bales 10 to 15 tons a day. Sold on 5 days trial. Catalogue free. Address GEO. ERTEL CO., Quincy, Ill.

Send for Catalogue No. 44, which describes the full line.

Easy Harness

All harness, old or new, is made pliable and easy—will look better and wear longer—by the use of

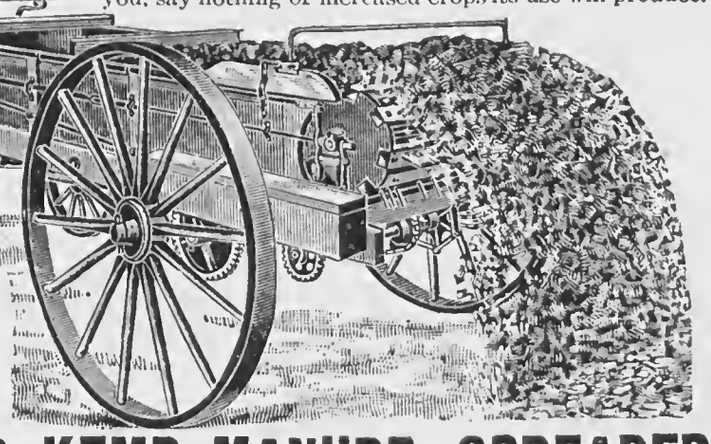
Eureka Harness Oil

The finest preservative for leather ever discovered. Saves many times its cost by improved appearances and in the cost of repairs. Sold everywhere in cans—all sizes.

Made by STANDARD OIL CO.

It's Almost Past Believing

the amount of time, labor and money this machine saves you, say nothing of increased crops its use will produce.



It spreads all kinds of manure, lime, salt, ashes, compost, etc., rapidly, evenly and better than it can possibly be done by hand.

It makes no difference how hard lumpy, caked, coarse, strawy or stalky the manure is,

THE IMPROVED KEMP MANURE SPREADER

will tear it apart, make it fine and spread it just where you want it and in any desired quantity per acre. Greatly improved for 1901. Send for our new illustrated catalog, which describes improvements in detail, and tells about "How to Grow Big Crops." Catalog mailed free.

Remember that the only original and genuine Kemp Manure Spreader is the one made by ourselves. KEMP & BURPEE MFG. CO., BOX 38, SYRACUSE, N. Y.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER.

A National Weekly Journal for Country and Suburban Homes.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, JULY 13, 1901.

PROF. King on page 495 gives some facts not generally known about the changes in the silo. It was supposed for a long time that these changes were much the same as those which occur when fruit is preserved by sealing it, while hot, in tight vessels. Later investigations go to show that the processes of silage are different. At any rate Prof. King makes it clear that the airtight silo means better silage.

*

THE apple crop! It is one thing to produce it and quite another to sell it at a fair figure. In order to sell it to advantage we must know what we have to sell. The Government reports are useful, in their way, but they cannot be as reliable as a collection of reports from wideawake growers who realize what it means to be accurate. One of the reasons for organizing the New York State Fruit Growers' Association was to collect just such reports. Every apple grower in the country is interested in knowing what to expect from New York. F. E. Dawley, Fayetteville, N. Y., is secretary of the Association, and he should receive thousands of reports.

*

IN seasons like the present when, on account of the lateness of planting, haying and cultivating are crowded closely together, it is the custom of some to hurry the horses constantly, and thus make them work harder than they should. When to this extra work is added the discomfort of excessively hot weather like the present, the wonder is that more horses are not killed outright in the fields. We have known some men who avoided this without neglecting their work by stopping for three or four hours in the heat of the day and making it up in the light of the full moon. Of course haying by moonlight would hardly be a success, but plowing or cultivating can be done very well.

*

A FEW years ago some of the scientific people tried to frighten us by figuring that the world's supply of nitrogen is limited, and that unless new supplies can be obtained famine must be expected. Such statements do not annoy the average citizen, whose thoughts go but little beyond the dollar which buys his food, but experimenters are still at work trying to solve the problems of a new nitrogen supply. Some of them go so far as to claim that nitrogen will yet be taken from the air in large enough quantities to cheapen the cost of fertilizing. The electric current is expected to aid in this, and we understand that results have already been obtained which show beyond a doubt that our children or grandchildren will be able to "use the air for a fertilizer sack."

*

WE are receiving a number of reports from farmers regarding the selling value of farm property. One good test of prosperity is the ease with which one's capital can be converted into cash. A farmer, let us say, has a 100-acre farm which cost $70 an acre 20 years ago. What would it sell for now, or is it salable at all? While it is quite probable that the majority of farmers in this country would not care to sell their farms for what they cost, still if farm property has depreciated in value, as is claimed, the facts should be known, for there must be some good reason for it. We know of farms that give larger returns than 15 years ago, yet the selling price is less than then, and it is almost impossible to dispose of them for agricultural purposes. In some fruit-growing locations land suitable for apples or peaches commands fair sale at increased prices. This, however, is not a fair indication of the average farm conditions. We shall be glad to have readers tell us how the selling values of their farms will compare with those of former years, and whether the income from the farm is more or less.

*

DURING the fearful heat in this city two lemonade peddlers got into trouble over a piece of ice. Each claimed the ice, and from words they fell to blows. After a long squabble in the police court the policeman agreed to divide the ice in two parts. When he came to cut it the ice had vanished. There was nothing left but a wet place on the bricks! We have before now seen the farmers quarrel over property or so-called personal rights. When the final division was made it was found that the "ice" had gone to the lawyers or other parties who sat on the fence and egged on the conflict. Why can we not learn to divide before we fight?

*

A MAN with a horse and wagon but no harness except a bridle, wished to get the whole outfit to a stable a mile and a half away as quickly as possible. He studied the situation for a minute. Like the evolutionists, the "missing link" was what bothered him; but, unlike them, he soon found a solution. Why not make a harness of himself? Jumping on the horse's back he asked a bystander to hand him the wagon thills, and with one in each hand away he went on a gallop. The scheme worked well; better, probably, than if he had had long hills to climb or had been riding a bucking broncho or runaway. After all, the men who are most esteemed are those who can fit themselves into the real needs of life without any loss of time.

*

REPORTS of the damage done to the wheat crop by the Hessian fly show that some varieties of the grain are either not badly molested by the insect or else able to resist its attacks. If there were only a single report here and there we should consider that something else must be responsible for the difference, but the reports are numerous and we conclude that there is some basis for them. We desire to hear from all wheat growers who have noticed any difference in the ability of certain varieties to resist the fly. What varieties are best and what appears to be the reason for it? Why should it not be possible to develop in a variety of wheat the habits of growth necessary to give it a good chance against the fly? If there really are such varieties the public should know about them.

*

THE Postmaster General has issued a drastic order prohibiting carriers engaged in the free rural mail delivery from engaging in any outside work, with one single exception—that of taking subscriptions for newspapers or periodicals. The Department claims that some carriers have been so active in outside work as to show lack of energy in their official duties. Some of them acted as agents for various express companies, which was detrimental to the Post Office Department, it being claimed that they induced patrons to send parcels by express, rather than mail, thereby earning a commission. Considering the fact that our parcels post system is expensive and inconvenient, and that it is generally believed that the express companies have influenced legislation to this end, complaint of their further influence upon the carriers seems a trifle amusing. Rural carriers who are among our readers complain that Uncle Sam is a very parsimonious paymaster, which accounts for their willingness to add extra work to their official duties, which seem so poorly paid.

*

THE hot weather for the past 10 days has caused dreadful suffering and serious loss. It has been worse in these respects than many a plague or epidemic of contagious disease. It is likely that nearly 1,000 persons died from the effects of the heat in New York City alone, while many more were prostrated and seriously injured. Horses died like sheep during the worst of the heat, and thousands of dollars worth of perishable property was destroyed. The farmer, with open fields and growing things about him, may find the heat uncomfortable, but his family will not suffer as do the people in the brick and stone ovens of the city. There is relief in the country at night, but in the city the brick and stone retain the heat so that those who swelter inside are denied the sleep which ought to refresh and fit them for another day. Yes, the country is the place for comfort, yet we regret to say that there are so-called farmers who fail to take advantage of these opportunities. With abundant facilities for housing ice they have no ice house. With ample land they seldom know what it is to have the table loaded with cooling fruits or agreeable vegetables. With all the possibilities for shade the house stands bare to the sun, with no cooling shades from tree or shrub about it, but an open exposure to the pitiless sun. It is not possible for people to suffer on the farms as human beings do in the city, but what a shame it is for farmers to neglect their privileges, and refuse to surround themselves with the things that make life better worth the living!

*

IT is claimed that one of the three most important scientific advances during the past 10 years is the discovery that mosquitoes spread malaria, yellow fever and other diseases. Gen. Sternberg, of the United States Army, describes in the Popular Science Monthly some of the experiments conducted in Cuba:

It is quite certain that malaria is caused by a parasite that lives in the red corpuscles of the blood, and can be transmitted only by a mosquito of a certain kind, which must bite first the patient suffering from malaria, and then the person to whom the disease is given.

As to yellow fever, seven soldiers permitted themselves to be bitten by mosquitoes which were known to have bitten yellow fever patients. Six of them contracted the disease, and one surgeon who attended them died. Other soldiers slept in the bedding and wore the clothes of yellow fever patients, but not one became diseased. These experiments and others go to show that if mosquitoes can be destroyed in large numbers the chances of contracting diseases like malaria and some other fevers would be greatly diminished. The life habits of the mosquito were described on page 417 of THE R. N.-Y. If the inhabitants of towns or communities can work together with a few simple remedies the mosquito pest can be nearly wiped out.

*

WE hear quite a little complaint from farmers about some of the bulletins issued from the experiment stations. This complaint is not confined to the class who might be called dull or ignorant, but it often comes from men who have been highly successful in farming, and who have conservatively taken up many of the new methods and scientific practices. The chief criticism these men make is that the station bulletins are not always clear and easily understood. The facts are given with scientific accuracy, but it often seems as though the author or editor had mistaken his audience. He seems to be aiming at men well trained in scientific terms or methods, and not at practical men who have little time left in a busy life to study such details. In the opinion of these men the station people fail as popular editors, yet it is a fair question as to whether it is the duty of a station director to attempt a popular bulletin. We think some of the stations have made mistakes in attempting too much "popular" work. Men who are fitted by nature for scientific research have attempted to write these results down to the comprehension of the practical men who do little true studying. We think they would have done better if they had simply issued a technical report of their experiments and left to others the task of making the information popular, in the common acceptance of the term.

*

BREVITIES.

"No man is born into the world, whose work
Is not born with him—there is always work,
And tools to work withal, for those who will—
And blest are the horny hands of toil!
The busy world shoves angrily aside
The man who stands with arms akimbo set,
Until occasion tells him what to do—
And he who waits to have his task marked out
Shall die and leave his errand unfulfilled."
—Lowell.

"THE shovel plow on the hog's nose."

THE do all purpose man is a Jack of all trades.

SOME men go around a rock—others pull it out!

OBSERVE how often the cows line up at the brook this weather.

IF lack of hay makes you forlorn—get out and plant more fodder corn.

PRETTY tough—when a farmer takes city boarders and has to buy his vegetables!

WE never saw crops quit and fall down as rapidly as they did during the recent hot period.

To knock out a man and declare him dead beat just mix the humidity up with the heat!

WE plant late peas where the early ones grew—plowing the first vines under. In this way we obtain a surer crop.

WHY do we say "cool as a cucumber?" The hottest business on the farm is picking cucumbers on a Summer afternoon.

No, we do not like to see a housewife so opposed to dirt that she will hurt herself during this hot weather, trying to scrub it all out.

OBSERVERS are likely to be deceived in estimating this year's hay crop. The grass on many old meadows is tall but very thin, and will not weigh out well.

THERE is complaint of a shortage of horses in central Kansas. So many animals have been purchased by the British government that prices have increased nearly 50 per cent.

"SICKNESS or disease is any departure from, failure in, or perversion of normal physiological action in the material constitution or functional integrity of the living organism."

MILITARISM bows before agriculture in Kansas. The annual target practice of one of the State regiments was indefinitely postponed recently because the members were so busy in the fields.

Events of the Week.

DOMESTIC.—The Wabash limited train from Boston to St. Louis was wrecked near Peru, Ind., June 26; 13 persons killed and many injured. . . . . Fire destroyed a breaker and washery of the Delaware and Hudson Coal Company at Wilkesbarre, Pa., June 26; loss $100,000. . . . . Fire at Mayfield, Ky., June 26, destroyed seven tobacco rehandling houses, a large quantity of tobacco, a cooper shop and 32 small residences and stores. Scores of persons were rendered homeless. The loss is estimated at $200,000, partially insured. . . . . The excursion steamer Mohawk struck a rock in Long Island Sound, near Glen Island, June 30, and sank within 20 minutes. There were 900 persons on board, but no lives were lost. . . . . A corner plot at Broadway and Thirty-fourth St., New York City, comprising less than half a city lot, was recently sold for $375,000. . . . . At Chicago, Ill., July 1, 11 persons were killed by lightning, which struck a pier on the Lake shore under which they had crowded for refuge from the storm. . . . . July 1, 81 persons died in New York from the heat. It was the hottest July 1 on record, the official temperature, 20 stories above the street, being 98 degrees, while the street temperature was 103 to 107 degrees. The mortality among horses was vastly greater in proportion than among men. The Bergh Society estimates that not less than 250 horses died from the heat in the city between sunrise and sunset July 1. At the New York Veterinary Hospital nine doctors were kept busily employed all day, and they treated more than 150 horses suffering from heat prostration. It was the general verdict of veterinary surgeons that more horses died July 1 in New York than on any single day since the great epizoötic ravages of many years ago. The fact is that the horses have been going through another epizoötic siege of late, a sort of horse grip, with the result that many of them were in a low physical condition when the present burst of heat came and were ill-fortified to meet it. The heat extended over the entire country east of the Mississippi. The high temperature continued July 2, when 161 deaths from heat were reported in Greater New York, and the heat increased July 3. . . . . Fire at Huntington, W. Va., July 2, destroyed hotel and other property valued at $200,000. The city water reservoirs were empty, and all the fire engines were out of repair. . . . . A large new apartment house in New York City was struck by lightning July 2 and burned down; loss $300,000.

ADMINISTRATION.—When Secretary Gage's action in imposing countervailing duties on Russian sugar exported to the United States was followed by so disproportionate reprisal as the imposition of 30 per cent increased duties on the most important American importations there, the importers of American tools and machinery seemed stunned. They were disposed to support Russia on the legal aspects, but some of them reëxamined the matter, and concluded that the Russian sugar regulations amount to practical compulsion to manufacture for export. They still doubt the expediency of Secretary Gage's action, but latterly they have concluded that if the policy was mistaken, of which, after all, Washington, knowing the complete facts and fostering American interests throughout the world, was the best judge, it does not follow that a backdown is now expedient. They claim that such a precedent would weaken American commercial and political prestige. Attention is directed to the increasing disinclination of the Russian authorities to permit the importation of any goods which the Russians can produce, no matter what they cost. This policy, more than the tariff, obstructs foreign trade. It is recalled that the government recently narrowly restricted the use of foreign goods in the Russian army and navy factories, and that the same policy is pursued wherever the government influence extends.

PHILIPPINES.—General Chaffee is preparing to push Malvar, the insurgent chief in Southern Luzon. He has ordered the transfer of the Fifth Infantry from Northern Luzon to Batangas Province. The general has been informed that Malvar's principal headquarters are in a mountain town in Northern Tayabas, whose inhabitants are contributing to Malvar's support. General Chaffee has not formulated plans for the occupation of the Island of Mindoro. General Hughes, at his request, will be permitted to continue in command of the Visayas Islands until the Samar campaign is completed. Consequently, General Davis will continue, temporarily, to be provost marshal at Manila. Four American prisoners, who escaped from Calapan, Mindoro, June 25, in a sailboat, have been recaptured. Six others are reported to be in Southern Mindoro. Bills have been passed establishing a board of health for the Philippines and providing for laboratories in connection therewith. The salary of the health commissioner will be $6,000. . . . . Three officers of the Forty-third Infantry are under investigation on charges of violations of orders by permitting trade between ports that were closed to trade. This was an offense considered grave in itself, but with it was coupled the charges of bribery and corruption. It is claimed by witnesses, both native and American, that these officers not only permitted steamers to go into prohibited waters, but in several instances went personally themselves on such trips to collect what was due them. Some witnesses charge that as high as $500 Mexican has been paid by the owners of steamers for illegal permission to go into closed ports, where a very profitable trade was driven in hemp and rice. It is asserted that the rice taken went into insurgent towns, where its value was doubled. Some steamers paid high rates for privilege of going into the rice districts and securing cargoes, which, it is claimed, were sold at high rates of profit.

GENERAL FOREIGN NEWS.—A despatch from St. Petersburg says the crops in the province of Saratoff are withering and the grass is scorched, owing to the prolonged heat and drought. The price of corn is jumping up and the outlook at Saratoff and in the neighboring Volga district is alarming. The scarcity promises to be as severe as the famine of a decade ago. . . . . Fresh reports of fighting in Manchuria and on the frontier of Chi-Li Province have been received in Tientsin. A pitched battle has been fought at Shan-Yang, in which the natives defeated the Mohammedans. Advices received in Simla from the Sikkim border say that an edict, signed by the Emperor and Empress Dowager of China, has been posted in Chinese Thibet announcing that the European Powers have been victorious in Northern China and ordering that the lives of missionaries and Christian converts be respected on pain of decapitation.

FARM AND GARDEN.—Representatives of the Japanese government have been in Chicago to inquire into the methods of American horse breeding. The members of the party are connected with the agricultural college of the Japanese government. They say horses in Japan are, as a rule, of inferior breeds, which operates as a serious handicap not only from military point of view, but from a domestic point. The superior quality of the American horse is becoming recognized the world over, the visitors say, and while they will visit England, France and Germany before their return to their native land, they are frank to admit they are of the opinion that the best horses in the world are being bred in this country.

The National Live Stock Association is testing the constitutionality of the Colorado State law which requires State inspection of live stock after a clean bill of health has been given by the Federal authorities.

The annual convention of the National Apple Shippers' Association will be held in Toronto, Canada, opening August 7.

Illinois Corn Carnival will be held at Peoria, October 7—19; Bert L. Heylman, secretary.

The Canadian Horticultural Association will hold its annual convention at London, Ont., August 5—6; secretary, A. H. Ewing, Berlin, Ont.

CROP PROSPECTS.

JULY 3.—Not much of an apple country around here; a fair bloom, but nearly all dropped off; not as many on the trees now as last year by one-half. F. C. J.
Kishwaukee, Ill.

JULY 3.—Apples less than one-fourth crop in this county. Corn very backward owing to cold wet Spring. Early potatoes less than one-half crop; late crop will be very short unless we have rain soon. Farmers commenced harvesting; wheat good, hay fair. This section is suffering for the want of rain and from excessive heat.
Espy, Pa. M. C. M'C.

JULY 4.—We haven't had any rain since early in June, and our potatoes must be badly injured. Grass fields are brown from the burning sun. Hay all secured in good condition. Corn is coming forward nicely, and will wait awhile for the rain. We commence the wheat harvest to-morrow. D. C. L.
Middlesex Co., N. J.

JULY 4.—In this part of Allegany County, N. Y., planting is just being finished. I planted corn June 4—5 that is now eight inches high. Potatoes planted in May are choked in the bricky ground. I have planted 11 acres of potatoes from June 26 to July 2; ground in ideal condition. Others are planting yet. Grass is in large quantity, but seems to have but little feeding value. I have some oats treated with formalin; (two ounces to one gallon water and sprayed on till the oats were wet and then air-dried.) Will they do to feed horses, 16 quarts a day? No apples except a few Greening and Spy.
Whitney Crossing, N. Y. J. S. B.
R. N.-Y.—The oats may be fed with safety.

Many foreign buyers are in the Kansas wheat district making contracts for exporting the grain. The French have a preference for Kansas wheat, their millers considering it superior for flouring.

J. A. Davis, a former New York produce dealer, now raising strawberries at Goldsboro, Md., expects that before the season is over he will have shipped 500,000 quarts of berries. The cost of handling this crop will be not far from $7,000.

The apple crop will be very small in this section. Wheat a fair crop; hay a good yield. I have just finished hauling clover from a nine-acre field that yielded 23 two-horse loads, over a ton to the load. Corn backward; beans looking well, large acreage planted; potatoes, small acreage planted; crop promising. W. N. R.
St. Johns, Mich.

It is reported that 20 Kansas farmers, whose grain was going to waste for lack of help in harvesting, armed themselves with revolvers and held up a train containing 200 men who were bound for the grain fields in the Far West. According to the account the men resented this original and strenuous method of solving the labor problem, and for half an hour there was a free fight. At last a compromise was made, the harvesters agreeing to stop there and work at $3.50 per day.

The present indication from the entire apple-growing belt of the United States is that the crop will be very much below the average. Reports from other States indicate that there will be a good demand for New York apples, and it is greatly to our interest to know as nearly as possible what the yield will be. We are making some efforts to secure reports about the crop in other States. F. E. DAWLEY.
Sec'y N. Y. Fruit Growers' Association.

ORLEANS CO., N. Y.—We have had a very wet Spring, and as we have nearly 50 acres of beans up it has worried us to keep ahead of the weeds, but thanks to a new weeder (Z. Breed) we are out of the woods in good shape. A heavy rain packed the ground so hard that the weeder would not break the crust, so we put two bags of dirt (75 to 100 pounds) on to make it go through, and as the beans were up well it looked rather rough to folks who saw what we were doing; but it does my heart good to see how we cleaned out the weeds. The prospects in the county are very poor for most kinds of fruit, but J. E. Ailis will have a fair crop of peaches, but no pears. Last year most of the wheat went down badly in this section, all except a new kind, Dawson's Golden Chaff, and those who sowed that kind have a fine crop; all other kinds are a complete failure. The fly has the crop in this section and most farmers have plowed or pastured or will cut the wheat for hay, as the Timothy has made a good growth. One of our best farmers said he would not get two loads of straw from 25 acres, and some are worse off for straw than that. My wheat will go 40 bushels per acre. Some pieces of beans have suffered very much from the weevil or some kind of insect or worm, and some have replanted, but my brother has 90 acres and I 46 acres and they are very good, so if nothing prevents we can have baked beans and the sheep bean fodder next Winter. CLARK ALLIS.

I have examined four wheat fields of Dawson's Golden Chaff on four different farms, and find them all comparatively free from the fly. One of these was sown early and had no fertilizer. I have four acres of Carman No. 2 that is going to give 25 bushels to the acre, if I am any judge. I have also over 20 acres of Clawson that I expect to mow and cure for the sheep. There is more Timothy than wheat. These looked equally well on April 1. I have visited another field of white wheat sown on oat stubble, fertilized very heavy for the oats, but didn't grow many, and then had about 300 pounds to the acre on the wheat. It is a fine field of wheat as it stands to-day. I would think that one-half of the crop in Seneca and Tompkins counties is ruined. T. H. K.
Tompkins Co., N. Y.

Our wet weather has gone dry with a hot wave that is killing to man and team. Many have had to put up the horses and wait for cooler weather. The ground is harder than I ever knew it before, and is cracking open. We cultivate and fume and hurry, and sow our crops over several times, and then only get a moderate stand. It makes lots of work. My sugar beets have been a trial so far. I have had them washed out, packed down and dried down, till I hardly knew what to do; have sown them all twice over, and shall put about an acre of them into cabbages. They begin to grow now. Wheat is all destroyed by Hessian fly; oats are turning red with some trouble, and raspberries are dying with the new blight. The only healthy crop just now is corn, which will be as large as usual by July 4, always counting in weeds, which are plenty. Nothing seems to ail them. If it were not for the comfort I get from reading THE R. N.-Y. and hearing from friends through it I would get awfully blue these days. C. E. C.
Tompkins Co., N. Y.

Items of Interest.

According to the irrigation expert of the Department of Agriculture, irrigation has increased the value of a tract of land in Texas, larger than all New England, from $2.50 per acre to $50; and in sections of certain Rocky Mountain States a still greater increase in valuations has been made.

It is said that several carloads of bananas were given away in Jersey City one day recently. For some reason the consignees refused to accept them, and the fruit was in such a state that it had to be disposed of at once. Word was sent to an Italian settlement near, and customers for the bananas arrived in short order. Some brought push carts and wagons, intending to lay in a stock for peddling, but the railroad men refused to give except in small quantities to those who had baskets. This free distribution ruined the business of local banana dealers for a day or two.

Fruit Crop in Oregon.

Our horticultural commissioners report very bright prospects for Oregon fruits this year. While in some sections of the State the apple crop is not so heavy as last year—on account of overbearing—in other sections the 100 mark will be reached. In the aggregate the apple crop will be large, say 90 per cent, and of fine quality, as our fruit growers are up-to-date, giving thorough cultivation and eternal war upon fungus and insect pests. The Italian prune is grown extensively in Oregon, and this year our prospects are for a record breaker. There is no doubt but what thousands of tons will go to waste, for want of drier capacity to handle them. Pears will make 75 per cent of a crop. Peaches in eastern Oregon will make heavy crop; in southern Oregon 75 per cent, and in western Oregon 50 per cent. Cherries promised a heavy crop, but the continued cold rainy unseasonable weather is causing a heavy drop. Strawberries and all small fruits are a full average crop. Grapes, in sections where grown, will make 100. GEO. H. LAMBERSON.
Sec. Oregon State Board of Horticulture.

Crop and Weather Report.

All sections east of the Rocky Mountains have been suffering from intense heat, which has been partly relieved by local showers. Crops thus far have not been seriously damaged. Nebraska corn was in a critical state, but a heavy rain came just in time to save it. In the Ohio Valley and central Gulf States corn leaves are rolling badly, and heat and rust damage are reported to oats in the north. On the Pacific coast and the plateau east to the Rockies the weather has been abnormally cool, with light frosts in parts of Idaho and Utah. Small grain has ripened rapidly, the wheat harvest being about completed in Kansas and Missouri. Spring wheat in the Dakotas is heading out. Thrashing is in progress in southern Illinois and Indiana. Chinch bugs are active in the northern parts of those States. Cotton conditions are not promising. Cultivation in the eastern Gulf States was delayed by the early rains, and in a large part of Texas the plant is in need of rain. In central Minnesota heavy winds and floods have damaged crops. The apple prospect continues to decrease. Reports from several important apple States are less promising than a week ago.

NEW HAMPSHIRE NOTES.—There has been a decided improvement in crop conditions in this section of the Granite State during the past two weeks. Cloudless and windless days up to June 22, with temperature about 70 degrees. On June 22 and 23 heavy showers came just right; will be an increase in yield of hay in consequence. Early sorts of potatoes in full bloom June 29, and never looked better. Those who planted higher ground seem to have hit the mark. All agree that both early and late crops will bring top-notch prices. Corn is making phenomenal growth. Haying already begun, but grass is yet very green. We have experienced an unprecedented hot wave here this week, and it has been a dangerous experiment to work out in fields during middle of day. Great for crops, as soil is moist. Mercury has registered from 90 to 102 degrees in shade for four days. Heavy showers with wind of tornado variety did great damage to crops in some parts of Strafford County June 29. Good prospects for grapes, raspberries, strawberries and all garden crops. D. L. P.
Dover Point, N. H.

Woman and Home

From Day to Day.

A DREAM OF LUXURY.

If I had a mlillon dollars I would surely take my ease.
I would go where'er I llsted and I'd wear whate'er I please.
I wouldn't wear stiff-bosomed shlrts nor collars strong and high,
Intended greatly to impress the easual passer-by;
I wouldn't wear my well-made coat nor patent leather shoes,
I'd change the style of hat that I habitually use;
These stern decrees of custom whieh so hold me in their power—
If I had a milllon dollars I'd diseard them in an hour.

I'd get myself a pair of shoes a long ways off from small,
And if I found some eool plowed ground, why, I'd wear none at all.
I'd wear a great big hat of straw wlth overhanging brlm,
And look just llke the hired man, while a-swopping yarns wlth hlm.
I'd only have one gallus, and I'd wear a gingham shirt,
And I'd keep away from town, so's no one's feelings would be hurt.
And I'd make long trips to Nowhere, underneath tho rustling trees—
If I had a mlllion dollars I would surely take my ease.

—Washington Star.

*

KHAKI, which had a great vogue for Summer outing dresses two years ago, is now being utilized for cushion covers for outdoor usage. It is cool, weatherproof, and does not soil like delicate chintzes and llnens.

*

A LITTLE convenience we saw recently for the first time was a washboard small enough to use in an ordinary pail. It looked at first sight as though it belonged to a juvenile laundry, but was deep enough to stand in the pail, and only about six inches wide. It is really a very great convenience in washing out a piece or two, too small to demand a regular washtub.

*

NEVER throw mllky water down a sink without following it with a flushing of soda. The milk is especially likely to clog the pipe. Lime water is also excellent for flushing sink pipes. After washing sandy vegetables pour off the dirty water, so that the sand may be caught and removed, not thrown down the sink, for grit cuts and wears the plpes. In scouring faucets, care should be taken to keep the scouring grit out of the joints, as it cuts away the screw threads.

*

THE Chicago Record-Herald tells this of a small girl who appeared to think that phonetic affinity in names must imply kinship. Katie, the romping six-year-old, came dancing and singing into the parlor. Then, seeing a strange caller, she stopped, abashed.

"This is my little daughter," said her mother. "Katie, thls is Mrs. Baggs."

"How do you do, Mrs. Baggs?" said Katie, anxious to remove any unfavorable lmpression the visitor might have formed. "I know a little girl at school named Saxe. Is she any relation of yours?"

*

IT is noticeable that the baby clothes now offered by the best stores do not show the senseless elaboration of trimming or make common a few years ago. Rows of tucks or hemstitching—perhaps only a deep hem—finish the long robe, instead of an embroidered flounce; yokes and sleeves are plain, and the daintiness of the robe depends upon fine hand work rather than laces and embroideries. The same is true of petticoats, wrappers and cloaks. Certainly no fashion could be more senseless than that of elaborate baby clothes, with scratchy frills and heavy folds to torment the young flesh. Ruffles put on in bertha style form the finish around the yoke or guimpe. Ribbon sashes are never put on young babies, but sometimes a sash of nainsook or lawn star's from rows of shirring in the front of the robe, tying at the back. It is far better to omit such a sash, however.

*

A READER asks us what material to use to clean brass. If lacquered, brass articles should be well washed with warm soapsuds, carefully wiped with a dry

3850 Girl's Costume, 4 to 12 Years.

cloth and then put before the fire or in the sun to dry perfectly. If not lacquered, oxalic acid or polishing paste may be used. The acid (whlch is very poisonous) is excellent for cleaning brass that is badly stained; it should be applied with a brush, and the article well scrubbed, then washed, and polished, with a dry flannel. Salt and strong vinegar is our usual material for cleaning brass preserving kettles; the brass should be well washed and thoroughly dried afterwards. Rotten-stone made into a paste with kerosene or lard oil is excellent; this is used by engineers to keep the brass portions of their machinery bright. It should be well rubbed on with a flannel cloth or brush, until the metal has taken a fine polish; then washed off wlth strong soapsuds, and the surface wiped dry and polished wlth dry flannel or chamois.

*

AN Inquirer asks how to launder wash-silk waists. Wash in hot water with white soap or soap jelly; rinse with a little salt or vinegar in the last water, and iron with a rather cool iron. Soap jelly is made by shredding little pieces of white soap into hot water, and dissolving them. Pour enough of the jelly into the water to make a good lather. Dry wash-silk walsts (and indeed, any fabric of delicate color) in the shade. A good wash silk seems to wear for ever, and is extremely cool; after washing, however, it never has the crispness of cotton or linen, and does not usually fit as well. It cannot be lined without spoiling its character as a wash waist, and without the lining it becomes rather "slimpsy." The most serviceable of all washing silks is tussah, which has long been a favorite in England for Summer gowns, dust cloaks and shirt waists, and is now gaining popularity in this country. It is made in China and Bengal from the cocoon of a caterpillar distinct from the regular silkworm, and is brown or khaki color. Rather stiff at first, it loses this wlth frequent washings, continuing to become softer and silkier, and wears perpetually.

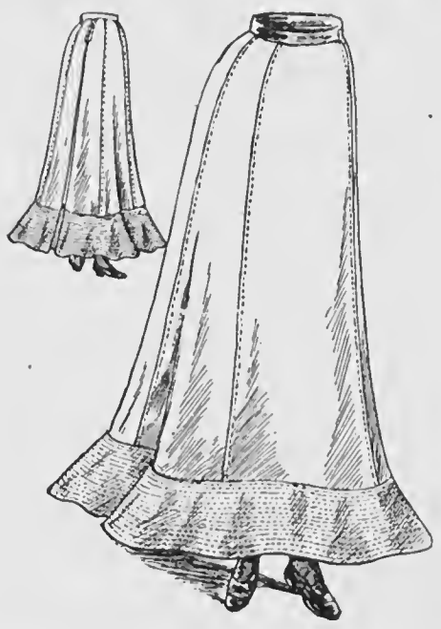
The Rural Patterns.

The girl's frock shown is of the simple style, belted at the waist, now so popular, and is admirably suited to piqué, linen, chambray and tne like, as well as to lightweight cloths and cheviots. The back is adjusted by means of the box pleats, but the blouse fronts are separate and seamed to the gored skirt under the curved belt. At the neck is a round collar of the material overlaid by one of lace, but otherwise the dress is quite plain, the edges and shield being simply stitched or trimmed with rows of narrow braid. To cut this costume for a girl eight years of age, four yards of material 32 inches wide, or 3¼ yards 44 inches wide, will be required, with ⅝ yard of all-over lace for collar, and ½ yard of tucking for shield. The pattern 3850 is cut in sizes for girls 4, 6, 8, 10 and 12 years of age; price 10 cents.

The short skirt figured is a very economical one to cut, and may be made with or without the flounce, as desired. The original is of homespun in soft mixed grays, but cheviot, serge and canvas cloth are equally suitable as well as pique, linen and duck. The skirt is cut in seven gores and fits smoothly at the upper portion, while it flares about the feet. The flounce is circular and can be seamed to the edge, the material belng cut away beneath, or applied over the full length skirt as preferred. To cut this skirt for a woman of medium size, eight yards of material 32 inches wide, 5½ yards 44 inches wide, or 5¼ yards 50 inches wide, will be required for full length skirt with flounce, 5¾ yards 32 inches wide, 3¾ yards 44 lnches wide, or 3½ yards 50 inches wide, when skirt is made plain. The pattern 3852 is cut in sizes for a 22, 24, 26, 28, 30 and 32 inches waist measure; price 10 cents.

A Successful Failure.

It was one day last Summer, wash day, too, for I remember so distinctly



3852 Seven-Gored Walking Skirt, 22 to 32 Waist

how dolefully long the morning had seemed, and how I even ate my dinner hastily, that I might the sooner go upstairs and take a good long rest. Mamma was away, and when dinner was nearly over, Mabel said to Papa:

"Is the corn down in the patch ready to use?"

"Yes," came the reply. "Do you want some?"

"Why, yes," said Mabel, "I think we'll try canning some this afternoon." I opened my mouth to speak, but closed it with only a sigh, but to one accustomed to read sighs that would have expressed volumes. Visions of my little bed upstairs came up before my eyes, and I was sure I had that morning discovered at least 13 new muscles whose only known use was to ache. How that corn would have suffered by standing until morning I couldn't see, but Mabel was "sot." We got down Dr. Chase's book, and found his recipe for canning corn. His recipes are always so good that we followed it without hesitation. Here it is:

"Cut the raw corn off the cob and fill your cans (after thoroughly scalding them), with the corn. Take a spoon and press very hard so as to fill the can full; put on the cover loosely. Put the cans into a wash boiler, after putting something under them to keep them from breaking, like the grate from the oven. Fill in cold water up to the bulge of the can, put on the boiler, cover and boil four hours. Take off the stove and let stand until cool enough to handle; fasten the covers tight and set in a cool place in the cellar. Take the corn when it is just right for the table."

"Four hours," I murmured, "why, Mabel, we won't be through till midnight!" Mabel smiled again, one of her calm reassuring smiles, and replied:

"Oh, yes, dear, we will get it all ready to cook by three, and then it will be off by seven, and that's not so very late."

Papa brought in the corn and we husked and cut and scraped and scraped and cut and husked, until it grew most painfully monotonous, especially as by three o'clock we could scarcely see the end of husking, and we didn't get that corn on to cook until 'way after four! We had some factory tin cans, and used them. The lids have little holes in them and are soldered on before the cooking commenced. The holes were left open for steam to pass out. We packed the corn in just as tight as ever we could, leaving very little room for expansion, but we went according to directions. I've often wondered since whether Chase calculated on that expansion or not. If any other reader of THE R. N.-Y. ever tried the same I wish she would tell about it.

Well, something after seven o'clock we assembled in the kitchen to wait, and were dreaming of the corn of coming days, when pop—hiss—bang—clatter—clutter—spluch! The boiler lid was lifted clear off somewhere, the stove was a sight, the floor recarpeted lmpromptu, the pipes and pump scarcely recognizable, and Mabel's bonnet was

THE experience of practical painters has proved that thin coats of paint, well brushed out, give the most durable results. Because of its great spreading capacity and its extreme density, Pure White Lead is the pigment best adapted for this method of painting.

The brands shown in the margin are genuine *"old Dutch process" White Lead*, the best it is possible to manufacture.

For any color or shade required, use NATIONAL LEAD COMPANY'S Pure White Lead Tinting Colors. Pamphlet sent free upon application.

National Lead Co., 100 William Street, New York.

patched with a material entirely foreign to that of which it was originally composed. Mabel was surprised, and papa was vexed, I was flustered and two cans of corn were burst. We waited for no further catastrophe, but removed the corn immediately. Papa soldered the holes in the lids, to the best of his ability, but not saying anything against his ability, the next morn there were five lids we could easily stick pins through. There were two cans left, and with what pride we exhibited them as the grand result of our labor!

When worried or blue, I used to go to the pantry, and as I looked at those two cans of corn I would say to myself: "My dear, be not cast down, see what thou hast accomplished even in the hour of vexation and discouragement." And then I would feel better. Proudly we led Mamma to see them, and all she could say was "Why, girls!" Mabel seemed to comprehend her instantly, but I pondered over her words for some time, and wondered whether it was only strong emotion, or if there could have been a tinge of reproach in her tones.

One day a week or two after that, I was ironing near the pantry door, when my attention was attracted by a peculiar sound emanating from thence. Curiously seeking its cause, I peeped inside the door, but quickly turned back feeling pale. "Oh, Mabel," I moaned. "Why, my dear, what is the matter?" I didn't answer, but groaned, pointed to the pantry and staggered toward a chair Mabel would never have admitted it, but I know she must have had frightful visions of snakes and spiders and crowds of creeping things—but she saw only corn—that's all—there were some other things there above and behind and under the corn, but over the floor and wall and shelf, over crock and kettle, and pitcher and pan, there was a slimy coat of corn.

Mabel said she would clean it up if I would wash the milk cans. Bless her dear heart, she was fearfully exasperating in her calmness sometimes, but so sweet and good at others. I despised to wash milk cans, but it was pleasure unspeakable compared with working with that vile stuff in the pantry. We have one can left from the nine. It stands to-day a monument in loving remembrance of its vanished brothers and of our departed glory, and we cherish it as dearly as if it were our one ewe lamb.

E. F. H.

Don't Worry.

It is amazing how much trouble a human heart can hold without exploding, says the Chicago Record-Herald. It is even more amazing how many imaginary grievances some misguided mortals can conjure out of their own thoughts. Wait until you have a real grief. Wait until you have a trouble so deep and terrible that you can't shed a tear to save your life. Then you'll wonder why you ever wept your nose red because the collar of your Spring coat had a pair of crow's-feet in its seams. You'll be amazed at your own foolishness for worrying over wall paper that didn't match the green rug. It will set you thinking hard when your mind wanders back to the day when you thought you wanted to die because you had a blister on your heel and a long tear in your new swiss gown.

The world is much the sort of a place that you make it yourself. If you haven't any troubles, for heaven's sake do not put on your Sunday hat and rush out to seek them. What if the oven of the gas stove is broken? You can eat bread if you can't have toast. What does it matter if your shirt waist sleeves are just a bit too short? That's nothing. Anyhow, not enough to make yourself miserable and sick about. If you have nothing more to worry you than the simple mistakes and mixed-up events of ordinary existence, get down on your knees and thank God from the depths of your heart. You are in luck. You are in great good luck. You should be shouting anthems of joy and thanksgiving.

There are few individuals in this sad, beautiful old world who, one time or another, do not feel the heart-illness of a crushing sorrow. It seems as if these painful experiences were necessary to make us realize that the privilege of being alive is a tremendous one, and one which should not be overlooked. When your dose comes, take it like a man, put on the boldest front you can—and hope.

There is a woman who lives not a million miles away from Chicago who has everything on earth that a sane woman should or could want. But, bless your heart, she stays awake nights so as not to get behind with all the fretting she has on file. If she has to make a pretty petticoat for the baby she has all sorts of mental spasms because she paid a little too much for the embroidery. If the cook lets the bacon get a bit too crisp tnat woman is in acute despair. When the rain beats down and the cellar looks like a tidal wave let loose she shrieks all sorts of shrill high notes from low A to high C, and then takes to her bed with an ice pack on her head. When a burglar picks at the basement door and walks away with a bag of clothespins and the clothes-wringer, she acts as if the entire family had been seized with the smallpox.

Poor lady! She doesn't know how lucky she is to have the bacon too crisp or the basement of the house a bit too moist. And she doesn't know how much precious time she is wasting in fretting over trivial matters which are so unavoidable and which, compared with real troubles, amount to nothing at all. The trouble with this particular type of femininity is that she burdens everyone she meets with her long, doleful recitals of tear-compelling trials. One wants to run around the block at the first glimpse of the bobbing aigrette on her hat.

Rural Recipes.

"Good Lord, in every time and place
Give meat enough for saying grace;
But if no meat Thou art bestowing,
Give bread enough to keep us going!"
—Atlanta Constitution.

Rhubarb Jelly.—This is best made when the rhubarb is well grown, towards the end of the rhubarb season. Wash the stalks, but do not peel, as the pink skin gives an attractive tint to the jelly. Cut the stalks into medium-sized bits, never mind stringing them, and to each pound of fruit allow a cupful of water. Stew gently until a perfect pulp. Strain through a cheesecloth bag, and to each pint of juice allow a pound of granulated sugar. Let the juice boil for about 20 minutes, add the sugar, and stir until the sugar is quite dissolved. When the syrup is thick turn into glasses and cover when cold. You have here a very agreeable, pretty jelly, its pale pink tone being unusual and an ornament to any table.

Peach Cake.—Make a good, rich baking powder biscuit dough and roll out until not more than half an inch thick. Place in long biscuit pans; brush well with butter and cover the entire top of each cake with sliced peaches, arranged in symmetrical rows. Sprinkle generously with granulated sugar, cover the pan with a tin baking sheet or another biscuit pan and bake for 25 or 30 minutes. The idea is to cook the fruit thoroughly without reducing it to a pulp or drying it up, and to retain the shape. If peaches are well ripened they may be cut into halves and placed with rounded side up.

Apple Cake.—Measure two cupfuls of sifted flour, add two teaspoonfuls of baking powder and half a teaspoonful of salt and sift again into a mixing bowl; make a well in the center; beat whites of two and yolk of one egg until light, add grated rind of a lemon, one tablespoonful of melted butter and a cupful of milk; mix this gradually into the flour until you have a thick batter or very soft dough. Spread this on shallow, well-buttered tins, having batter not more than half an inch thick. Pare and cut into eighths enough large, tart apples to cover the top of the cakes by laying the pieces close together in rows, pressing the sharp edges into the dough; brush well with softened but not melted butter, sprinkle thickly with granulated sugar and bake in a hot oven. When done dust with powdered sugar and cinnamon.

Pineapple Cake.—For the cake part, beat three eggs without separating until very light and foamy. Add 1½ cupful of sugar and juice of a half a lemon and beat again until it is a foamy mass. Then beat in a scant cupful of cold water (not ice-cold) measure two cupfuls of sifted flour, add two teaspoonfuls of baking powder and sift again. Add this to the cake mixture and beat until the batter is very smooth. Spread the batter in two layer cake tins and bake in a rather slow oven for at least 25 minutes. It must be thoroughly done but not baked too dry. For the filling, select a very ripe sugar-loaf pineapple, pare and remove eyes and core, chop as fine as possible and then pound to a paste; add sugar enough to sweeten the pineapple to taste and spread between the layers quarter of an inch thick; or cook the pineapple and sugar together until you have a thick marmalade; this will prevent the juices from running away from the pulp while the meringue is baking. When the cake is put together, cover it with a meringue made by beating the whites of three eggs to a stiff froth and adding three tablespoonfuls of powdered sugar and a tablespoonful of lemon juice. Bake the meringue very slowly in the oven for 10 minutes; if it cooks too fast it will be spoiled.

Bacon with Cream Gravy.—Cut the bacon into the thinnest of slices and soak in milk for 10 or 15 minutes. Grease a hot frying pan with a little of the fat, dip the slices of bacon into flour, and fry brown, laying them on brown paper to drain. Pour out the fat into the pan, and put in the milk the bacon was soaked in. Mix a tablespoonful of flour with a little cold milk and add when the milk is at the boiling point. Stir well, let it boil up once and pour over the bacon.

String Beans.—This is the way Mrs. Lincoln cooks string or wax beans: One quart of beans. If not fresh picked, put them in cold water to make firm and crisp. Remove the strings and cut in thin slanting slices. Put again in cold water; do not prepare them more than half an hour before needed. Allow one heaped tablespoonful of butter, one-fourth teaspoonful of pepper, one-fourth teaspoonful of nutmeg and one level teaspoonful of salt. Do not be afraid to use the nutmeg. It may seem out of place with beans. You will not recognize it as nutmeg, and yet you will miss something delicate and delicious if you do not use it. Put the butter, salt, pepper and nutmeg in a broad granite stewpan with tight cover. When the butter is melted, take the beans from the water in handfuls with only the water which clings to them, and put them into the butter. Use no more water. Cover tightly. As soon as they become hot set them where they will cook very slowly, yet there must be heat enough to make steam. The butter and liquid drawn from the beans make sufficient moisture to steam them, and they will be perfectly tender if they cook slowly and be of finer and entirely different flavor than when deluged with water. Stir from the bottom occasionally that all may have the seasoning. So long as there is liquid enough to cover the bottom they are safe. If they cook too rapidly and are dry, you may add two or three tablespoonfuls of hot water. When done they should be quite dry, except for the coating of butter. Send at once to table. Small fresh picked beans will cook tender in 30 to 50 minutes; if they have stood over night it requires an hour longer. It will do no harm to let them stand on back of range if they are tender before you are ready for them.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Seasonable Recipes.

Canned Strawberries.—To can strawberries so that they will keep their shape and color, after the berries are picked over, put them in a jar, with a layer of sugar and then of berries until all are used. Set them in the cellar over night, and the sugar will penetrate them, and no water must be added; there will be sufficient juice. Have a sugar syrup on the stove hot, put the strawberries in and let them boil up gently; then fill cans with the fruit and juice all cooked together. Screw on the cover, stand the can upside down a few minutes, then turn again, changing it in this way until it is cool, and the berries will not rise to the top. This way preserves the shape, color, and flavor of the fruit.

Or-Ra-Cur.—Five pounds of currants, five pounds of sugar, juice and grated rind of three oranges, one pound chopped raisins. Boil 20 minutes, and put in cans.

Chopped Cucumber Pickles.—12 large cucumbers, six onions, one-half cupful salt, one-half cupful white mustard seed, one teaspoonful pepper, a little cayenne. Chop fine, cover with sharp vinegar; can or cover tightly without cooking. It is ready at once, and is very fine.

WHOLESALE PRICES.

NEW YORK, JULY 6, 1901.

GRAIN.—Heavy export trade in wheat is reported for shipment from Gulf points. Corn trade is active all around. Drought damage in the West forced prices up a little, but conditions are more favorable now.

BUSINESS BITS.

To prevent annoyance and probable loss of both time and money it would be well to keep a supply of Tuttle's Elixir on hand ready against the time when you shall need it. It is for sale at all drug stores, or will be sent direct by the manufacturers. Write Dr. Tuttle for a free copy of his book, "Veterinary Experience," which contains many valuable points on the diseases of the horse and treatment.

IN the making of farm implements, as in everything, the specialist is the successful man. One of Ohio's large manufactories traces its prosperity to this policy. The Roderick Lean Manufacturing Company, Mansfield, Ohio, have for 26 years confined their efforts to harrows and land rollers—and, by concentrating all their energies on this branch of the industry, have brought their product to the present state of perfection. Their harrows, both spring and spike toothed, and their land rollers combine extreme lightness with the greatest strength—all metal parts being steel. It is claimed that they are the most efficient, lightest draft and most durable machines on the market. The Lean Company issues a catalogue which is sent on request, to all interested parties.

A RECENT Government report upon the dairy interests of the United States and Canada shows that the annual milk production drawn from 20,000,000 cows is worth $500,000,000 and that over $2,000,000,000 are invested in the dairy industry. Figures so stupendous are almost beyond human comprehension, and yet there is every possibility of this fabulous sum earning an additional 20 per cent upon the investment. In a series of recent tests it has been conclusively proved that by the use of Childs' So-Bos-So Killfly, cows will give from 15 to 20 per cent more milk, and better milk, if protected from flies by its use. It is convenient, cheap and practical, and has received the highest endorsement of all leading dairymen, horse breeders and farmers throughout the country. It is such inventions as this that give a rosy tint to the dairyman and farmer's outlook, and Messrs. C. H. Childs & Co., Utica, N. Y., the inventors, are to be congratulated upon giving the dairy industries such a valuable acquisition.

THE modern grain drill is undeniably the best means of sowing grain of all kinds under all conditions. While even a very indifferent drill will sow grain there are many things to be considered by the farmer or planter when it comes to purchasing such a machine. There are degrees of quality in grain drills, same as in other things. Since the first object of a drill is to distribute grain, seeds, etc., great attention should be given to the sowing and feeding devices. The drill which contains prime grain drill essentials is the improved low-down Pennsylvania force feed fertilizer grain drill. It is the product of the great farm tool and implement manufactory of the A. B. Farquhar Co., of York, Pa. As its name indicates it is low-down and being built thus close to the ground it is easy to load with seeds or fertilizer. The reputation of the firm removes every element of chance in the purchase of anything they manufacture. In addition to the hoe drill, they also manufacture a disk drill which fully sustains the manufacturers' reputation wherever used. Write them for their large general catalogue of farm machinery, etc.

Dr. D. Jayne's Expectorant certainly does go directly to the root of all Throat and Lung troubles There is abundant evidence of this in its sixty-two years' record of cures.—*Adv.*

The Domestic Sheep.

Its Culture and General Management. By Henry Stewart. An up-to-date book on sheep. The most scientific, practical and useful book ever published on this subject. Indorsed by the world's highest authorities, press and sheep public everywhere. It contains 372 pages of "boiled-down" knowledge and 165 plates illustrating the recognized breeds and every department of sheep life. Price, $1.50 postpaid, or free for a club of four subscriptions at $1 each.

The New Horticulture

BY H. M. STRINGFELLOW.

We do not hesitate to say that this is one of the most interesting books on horticulture that ever was printed. Most reading farmers have heard of the now famous "Stringfellow Method" of planting trees, but few understand clearly what it is. This book tells the whole story in clear-cut, forcible style, which all can understand. Not only is the theory of close root-pruning carefully explained, but the general principles of gardening and fruit-growing are discussed. Mr. Stringfellow is a practical gardener, and he gives his own experience. We commend the book to all without reserve. New Edition, paper covers, 50 cents.

THE RURAL NEW-YORKER, New York.

Market Briefs

PICKED UP HERE AND THERE

NATURAL INDIGO is the product of certain leguminous plants, cultivated to a large extent in British India, China, Java and Guatemala. For 20 years German scientists have been actively engaged in efforts to make artificial indigo, and it is claimed that they have now succeeded in getting up an article which is equal to the natural product and can be made cheaper. Whether this artificial blue will prove as durable and generally satisfactory as the natural under varying conditions can be told better when the results of tests now under way are known. Shipments of woolen clothing dyed in this way have been sent to tropical countries, where it will be severely tested. If no drawback is found in this artificial product, planters will have to lessen the cost of production or get out of the business. Many of them are feeling blue over the outlook, but it is more than likely methods of growing and handling the plants will be improved, as the question is already being studied seriously by the planters. The wholesale price of indigo, as quoted in New York, runs from 40 cents to $1.15 per pound, according to quality.

THE CAT-TEASER is an invention intended chiefly for the relief of people in the residence section of cities who are tormented by cats, which travel back and forth through the backyards between rows of houses, breaking down plants in flower beds and making the night air lurid with their yowls. Most people simply endure this nuisance, protesting now and then by saying "scat" or throwing things out of the windows, which, of course, never hit the cats. The best of these cat-teasers is thoroughly effective for those who have a tight fence so that the only way the animals can get into the yard is to jump over. It consists of a lot of wires seven or eight inches long set in a strip or joist about two inches apart, and sharpened at the top. They come in sections, and a row of them around the top of the fence fixes it so that no cat can get in or out. The sharp points give them no chance to jump or climb over. One man tried a plan which worked fairly well for a time. He was an electrician by trade, rigged a wire along the top of the fence, and attached a battery giving quite a strong current. Any cat that touched the wire would be greatly surprised and get off the fence at once. A good barn cat is a highly profitable piece of live stock for a farmer. There are too many, however, in cities. While no cruelty should be tolerated, people certainly have a right to use harmless methods to keep them off their property.

FRUIT NOTES.—No doubt readers understand that any statement about the market conditions of perishable products in a large city can only give the facts at the time the report is made, as the next day conditions may be entirely changed. In notes of this sort it seems better to give the situation at the time the paper goes to press, rather than attempt to review the conditions for the whole week, which might be more or less confusing. The receipt and distribution of produce like fruits and vegetables in a large market are not unlike the ebb and flow of the tide in the ocean. The motion is fully as constant and as necessary to the health of the market. Stagnant water and stagnant markets are alike undesirable. Southern peaches are showing better quality. Prices for fancy grades run high, but inferior ones are hard to sell at any figure. Plums are low, but sell for more than they are worth, if those that we have tried were fair samples. There are still a good many damaged cherries seen, and none but the better grades sell for anything like fair prices. There are a few currants, but quality seems to be below prime. There is not much call for these as table fruit, except those that are large and fully ripe. Canners get the bulk of the lower grades. This fruit, second only to the strawberry when at its best, has never received the attention it merits. People pass by the currant and take the insipid raspberry or blackberry, which soon lose their flavor when exposed on the street. The strawberry season is practically over. Hot weather has boomed the trade in watermelons and lemons. W. W. H.

Observations on Strawberry Varieties.

Tice C. Kevitt had a strawberry field meeting on his grounds at Athenia (near Paterson) N. J., June 15. The day was cloudy and showery; attendance small. Mr. Kevitt has over four acres of berries, on soil adapted to growing fine fruit; gives them best of culture, and the exposure is such as to favor early ripening. He has a special market, disposing of all at his packing house to near residents, retail grocers and peddlers having the best paying class of customers. Few growers have equal facilities for raising fine fruit, and demand for all grades at full retail prices, even to the lowest grade. June 15 was not suitable for close observation, and I revisited his grounds again on June 18. Mr. Kevitt selects varieties of large size, seeks productiveness, and quality is a requisite. In the trial row were Jersey Market, William Belt, Sample, Ridgeway, Marshall, Bisel, Lovett, Improved Parker Earl, Parker Earl, Jr., Nic Ohmer, Gandy, Bismarck, Warfield, Duff I. S. Palmer, Haverland, Tennessee, Enormous, New York, Brunette, Johnson's Early, Clyde, Bush Cluster and Oom Paul. All these varieties were set in other portions of grounds, so that a fair judgment of merits could be obtained with accuracy.

New York made the best showing, quality first rate, sub-acid, no core, prolific and matured full crop. Is a seedling of Jessie, which it closely resembles in plant and fruit, and as a pollenizer of pistillate varieties far excels it, and in many localities is being set instead of Jessie as a pollenizer. Is of large size, color good, inclined to irregularity. Sample, a close competitor of New York, lacks character, and is inclined to be a little soft. More regular in shape and as productive as New York. Is proving to be a good berry for near market. Jersey Market is an old variety in some sections, though apt to be deficient in plant growth; good, high flavor, rather acid, large size, attractive in color. Set full, but did not mature crop well, yet the season has been such that only about 40 per cent of setting of most varieties has matured in the best strawberry sections of northern New Jersey. It ripened average crop for the season.

Glen Mary and Bismarck were said by Mr. Kevitt to be his most profitable varieties. Enormous, too irregular in shape and too acid to become popular; not extremely large for coxcombed berries. Brunette, large, regular dark red in color and flesh; fine quality, prolific, foliage inclined to blight. Bush Cluster, fruit resembles Crescent; not quite as acid; fruit stalks fully a foot long, extending above foliage, and while it matured a large crop, yet the long fruit stalks caused berries to sunscald badly. Bisel, large, prolific, fine quality for very acid berry, but too soft and delicate for even home use, unless great care is exercised in handling. Duff, very early, very prolific, ripened full crop; good size for early berry; lacks character. Very acid, large core, good early market berry. Warfield, too soft and poor to be profitable. Haverland, fine showing; very soft, and although its tough skin aids in marketing, yet not profitable. Clyde, while in most places a total failure from blight of foliage, here a perfect success.

Gandy was here, as in most of northern New Jersey, a failure as to yield. Mr. Kevitt had the true Gandy, known in many sections as the Jersey Gandy to distinguish it from the many seedlings grown from it. In many sections of North Carolina, Maryland and Delaware the Gandys sent to market are seedlings, as the original is too soft and unproductive to ship with them. I have found in Newark, N. J., market at least four seedlings which growers acknowledge to be such and carry very firmly. Nic Ohmer, Pride of Cumberland, Tennessee, Johnson's Early, Marshall, Lovett and Bubach were a failure as to yield.

Among new varieties, I. S. Palmer was originated at Stuyvesant, Columbia Co., N. Y., by I. S. Palmer, from Jessie and Bubach No. 5; very early, quality the very best, and berry possesses every characteristic of fine quality, yet being a new seedling its character is not fixed. It ripened at Mr. Kevitt's place June 1, four days before Duff; noted as very early. It is as productive as most very early berries, yet when compared with Duff is sadly deficient as to yield. Will be put on market next Fall. Oom Paul, origin and parentage same as I. S. Palmer; large size, prolific, in shape inclined to Jessie; good quality, rather acid, foliage inclined to blight. Will be put out next Fall.

J. B. ROGERS.

A Trip Through Southern New York.

Ex-Mayor C. W. C. Chapin, of Brooklyn, has purchased a large tract of wild land a few miles to the west and south of Monticello. I heard so much of it that I drove two hours to see it. To say that I was disappointed does not express it. A more forbidding place I never saw. It makes one picture the ex-Mayor as a long-bearded lord of iron will and selfish heart without a spark of fellow feeling or a drop of human kindness in his whole make-up. A workman told us all in three short sentences: "There are 17,000 acres; 20 miles of fence, and 32 wires on each post." There is nothing to be added except that the general neglect of the place is emphasized by frequent signs forbidding trespass; but why anyone would trespass on these forbidden grounds is not apparent. Even the diminutive garden is surrounded with a fence 10 feet high made of poultry netting with a mesh so close that the passer-by could hardly see through it. We were told that the ex-Mayor wanted to keep the place wild as a game preserve. As far as wild is concerned he is succeeding admirably. We saw one rabbit cross the road. White Lake is one of the most popular Summer resorts of the county. Surrounding it is a very good farming country. Edward Nolan and Hon. Luke Stapleton, of Brooklyn, have a Summer home and farm here, and the Sloan Bros., of New York, have one a little to the south. They have some young plantings of apples, pears and plums that are doing remarkably well. From the evident care given them nothing that can now be seen will prevent a nice crop of fruit from these plantings in the course of the next three or four years.

About eight miles to the north one comes into the territory reached through the Ontario and Western Railroad. This is a good farming section, and the country for miles on both sides of the railroad is literally overrun with Summer boarders during the season. At Liberty, Ferndale, Loch Sheldrake, Navesink, Woodburn and so on to Ellenville the villages and farmhouses are being put in readiness to receive the city guests. These people seem, however, to give themselves up to the task of housing their visitors. Home products for the table seems to be almost entirely neglected, milk alone being furnished from the farms. Meats and, for the most part, chickens and eggs, fruits and vegetables are shipped in from New York City. It seems a pity that farmers in this section should neglect this local market brought close to their own doors. It is a greater pity, because all these edibles become stale when shipped from city markets, while if delivered from the farms near by daily the luxury would make the city people rave with delight. It seems a shame that canned goods from New Jersey and Michigan, and sweet corn over-ripe and withered should be shipped into this farming county to feed the people who leave their city homes in the hope of escaping just such staples of the city markets. Our trip was planned to recross the Shawangunk Mountains, over a new road from Ellenville. This is a most delightful and interesting drive. For seven miles you climb a steady grade, leaving the beautiful little village nestled at the base of the mountain and confined to a narrow and fertile valley by the abrupt hills to the west. The new State's prison in course of erection is seen in the valley to the north. This road takes you past Arvosing and Minnewaska Lakes, at the extreme top of the mountain, the latter 10 miles up, without a sign of habitation intervening. Here the famous mountain Summer houses, "The Cliff" and "Wildmere" are located. They accommodate about 250 guests and are always filled to overflowing. The dark waters of the lake below, the blue sky above, and the stunted growth of trees and abrupt cliffs for miles around are the attractions of the place. Lake Mohonk lies five miles to the northeast: the drives are many and picturesque. About seven miles down the east side of the mountain you suddenly come to an abrupt bluff, and over this you see one of the most delightful farming countries to be found anywhere—the fertile valley of the Wallkill, and the fresh gardens of southern Ulster.

J. J. D.

ONE of those "pesky" brooder lamps got smoking the other night and burned a hole through the zinc and smothered about 25 handsome six and 10-weeks-old chicks. It isn't all honey in the chicken business.

M.

I HAVE closed out all of my different breeds; have made up my mind that the White Leghorn is good enough for me. I shall keep the S. C. and R. C. White. We are selling eggs for hatching, fowls for breeding, and then after the breeding season is over ship eggs to New York. The bred selected lays more eggs, larger and whiter than the Brown; is larger and better for table. H. J. BROWN.

What Is It?

A man who has been running a race with steam and electricity for years, finds himself suddenly stopped. It seems as if a cold hand clutched his heart. His brain whirls; he can hardly see. "What is it?" he asks himself as the attack passes.

If his question meets a right answer, he'll be told that his seizure is a warning to pay more attention to his stomach, which is already deranged by irregular meals and rich foods.

Doctor Pierce's Golden Medical Discovery cures diseases of the stomach and organs of digestion and nutrition. It eliminates from the blood disease breeding poisons. It makes the blood rich and pure, and furnishes a foundation for sound, physical health.

"About ten years ago I began to have trouble with my stomach," writes Mr. Wm. Connolly, of 535 Walnut Street, Lorain, Ohio. "It got so bad that I had to lay off quite often—two and three days in a week. I have been treated by the best doctors in this city, but got no help. Some said I had cancer of the stomach, others catarrh, others dyspepsia. Then I wrote to you for advice. You advised the use of your 'Golden Medical Discovery' and 'Pleasant Pellets.' These medicines I have taken as directed. I commenced to get better from the start, and have not lost a day this summer on account of my stomach. I feel tip-top, and better than I have for ten years."

Keep the bowels healthy by using Dr. Pierce's Pellets. They don't gripe.

MIXED WIRE NAILS

Each Keg contains 100 lbs. of new mixed wire nails from about 3 to 40 penny size. Order a Sample Keg. Write for Free Catalogue No. 57 on building material and supplies.

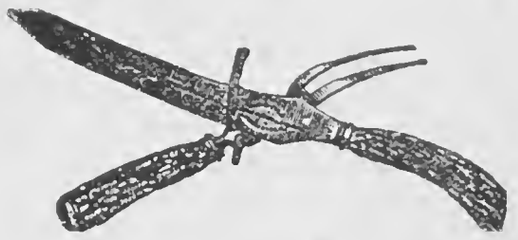
A Carving Set.

Every family needs a carving set three times a day. This set consists of a Sheffield carver with eight-inch handmade



steel blade, buckhorn handle, fork and steel. Price, $1.90; or we will send it for a club of two new subscriptions at $1 each and $1.25 extra money, or free for a club of six at $1 each.

Live Stock and Dairy

THE DUAL-PURPOSE COW.

Eastern and Western Ideals.

TWO-SIDED COWS.—Improper feeding, causing indigestion and the manifold troubles that the dairyman must meet, has been to some degree responsible for the demand for a dual-purpose cow. A scientific breeder, writer or speaker may not face the dairy problems like the men who meet their obligations from cheese, butter or milk checks. The pure dairy type, which cannot put on an ounce of meat, may be the ideal cow. I do not believe we should ask one machine to plow, sow, reap and thrash, yet we run a grain drill that sows grain, grass and clover with fertilizer, each one or all, with absolute certainty. I have found it no easy matter to keep one's teaching along lines that would be understood as coinciding wth actual practice. Columns are being written and long speeches made for and against the dual-purpose cow. Any idea or interest usually suffers in the hands of an extremist. The men who see only one side of a subject are not the safest men. I am reminded of the old man who, frequently passing through his son's sleeping apartment, observed that John always slept on his left side. Bringing the matter to his wife's attention he said that boy might as well quit studying law, because he could not *lie* on both sides. We must from a business standpoint look at things from every point of view. To go into a community where no specific dairy form is recognized and preach that saving grace will come to the dairyman who breeds only the extreme dairy form as found exemplified in many Jerseys, is a decided error!

BEEF AND BUTTER.—This question had its inception in the West, and has for its present champion Prof. Shaw, of the Minnesota Agricultural College. Prof. Shaw looks at the magnificent specimens of Short-horns at the Station barns, steps into the dairy barn adjoining and finds the thin bony Jersey, and says at once: "We need a combination of these, and behold both beef and milk; i. e., the mother gives 300 pounds of butter and drops a heifer calf to duplicate her performance, and the following year a bull calf that in its steer form tops the market in Chicago." It can't be done, but thousands of western farmers are trying it, at a loss. It is contrary to all laws of animal life. The dairy animal puts its fat into the udder and pail; she does not do it by chance any more than a smart boy is so by chance. You need not inquire, when you meet a bright, energetic, level-headed man, about his parentage; he had a good mother. The beef animal of the beef breeds is so far removed from dairy form and ability that only by the use of a wet nurse can the offspring be reared.

CAN'T BE DONE.—Viewing the case from the western conditions it seems incredible that any sane man could expect for a moment to breed a profitable dairy. The dual-purpose cow of the West and the dual-purpose cow of the East are as unlike as the beef and dairy types. With the western idea I have no sympathy; with the eastern notion there is at least debatable ground. I am satisfied that the dairy conformation has been carried to an extreme in many instances, coupled with early breeding and inbreeding, until constitution and vitality have been so weakened that tuberculosis is sure to result. As surely as one extreme follows another have breeders followed delusions and produced skin and bones. I have in mind a Jersey cow that failed at a State fair to receive the prize that her record, which no one disputed, warranted her in taking, because she was skin and bones and nothing else. Fat is not muscle, but it is to a degree stored energy, and my observation teaches me that when our cows drop below a condition of flesh which I cannot describe, but know as any dairyman knows, when seen, that they are more subject to ailments. This thin condition may be brought on through excessive feeding of protein foods, milking the vitality out of the udder, but this is not a general fault. Is it wise therefore to breed to an extreme dairy type?

RESERVE FORCE.—Self-preservation is nature's first law. Man has taken the dairy cow so far from the natural cow that produced a calf, fed it and quit, that this law no longer applies. She may be so well bred that her milking machinery runs away with her boiler capacity. We must keep reserve force on hand. The bank that keeps no reserve fund in the first place offends the statute law, and also an economic law. The nervous man unconsciously works beyond his strength, his nerve weakens, and he has to stop and restore again the wasted tissue. The nervous temperament is all right to a degree. If we possess at this early period in our National history any distinctly American characteristic it is surely this development of our hustling nervous energy, an ability to work 18 hours a day, two days in one. This tremendous high pressure construction has built our Nation and its present supremacy on land and sea. The two-minute trotter and pacer, the 200-egg hen and 600-pound butter cow, are examples in lower life of the same tendency in breeding. This seems heterodox, and you ask: "Shall we stop our advancement?" No, don't worry; nature will take care of the whole business. The slower plodding nature of the German immigrant is already making its personality felt in great sections of the country. He rears large families without the vital effort or loss of vital force. The children are strong, robust boys and girls, keeping close to nature and nature's laws. At 20 they marry without fuss or feathers, settle down to work, buy a farm and pay for it. The other fellow has gone, and they are in possession through quiet conquest. The trotter that has been bred for generations to use up vitality at a tremendous pace has no value as a producer. He puts 12 quarts of oats and a wisp of hay into a few minutes' work. The high-class nervous people are not raising large families. The fact in comparison with the immigrants mentioned needs no elaboration. It is easy to calculate who will control in the following generation.

COW COMPARISON.—Have we a comparison in our dairy stock? I think so. That dairy temperament is nervous temperament is well understood and accepted. What are some of our troubles? Uterine weaknesses, failure to breed, abortion and kindred troubles resulting from the inability of the constitution to meet the demands upon it by drainage in milk production. These forces are all self-regulating; of course man thinks he does it. Nothing of the kind. If man could have his way about it he would increase production without limit. But nature, so careful to preserve an equilibrium, does not permit man to run away with her.

THE EASTERN IDEAL.—What is the eastern idea of dual purpose? It is a cow that will give from 5,000 to 7,000 pounds of milk a year under favorable conditions, and when her usefulness at the pail ceases the carcass will weigh 600 pounds, that will bring in our country markets $36. I am not giving extreme figures in this statement. It is so easy to make our deductions from the one-in-a-hundred instance. I could give a case, but it does not happen often with us. We just sold a cow for beef that had been a 10,000-pound cow, for $65. She weighed 1,360 pounds, and was a model, a perfect milking machine, and yet had sufficient form to hold meat, so that she was not worthless. I can pick out 75 cows out of our dairies that will answer my first proposition when they cease to milk for this reason, or that, without extra feed than the milking condition, and we succeed in obtaining an average of 7,000 pounds per cow.

The great trouble and misunderstanding over this question has arisen from an effort on the part of the beef producer of the West to breed milk from beef type, which is a failure, and the eastern effort to get milk first and a second-class beef subsequently, or in case of accident to udders, the selling price will approximate the cost of another cow. This type of cow, distinguished from the extreme dairy type which has been held to our view, is the idea I wish to bring out. This idea as practically followed will not breed phenomenal producers, but it will breed 250 to 300-pound cows with constitution and vigor. The great rank and file of northern New York farmers are not doing this much. Their breeding is drifting along without much careful thought. At times a public-spirited man buys a purebred bull, and it is surprising how far-reaching the effect of his service may be, to the third and fourth generation. Fig. 209, page 495, illustrates my idea of a dual-purpose cow. These cows have ranged from 9,000 to 10,000 pounds of milk. Three of them have been sold. Cow No. 1 is the one referred to in these notes, sold for $65. No. 2 was sold for $50; No. 5 brought $42, all sold for beef. The cows No. 3 and No. 4 are still in the dairy, and would sell at present time at probably $75, the two making a total of $232, or an average of $46 per head. To illustrate more fully this matter I have just purchased two cows at $45 each, that are now giving 80 pounds of milk a day without grain feed. These cows are capable of taking the place of these shown in Fig. 209 at the pail, but not at the shambles. They are not quite as heavy.

H. E. COOK.

Poultry Notes.

Our Leghorn hatches seem to be the best; these very good, but the P. Rock, Wyandotte, Orpington and Minorca varieties not so much so. Average rather low. Chicks hatched are generally doing well. Bronze turkey hatches reported from my customers have been very satisfactory so far.

ARTHUR J. M'CAIN.

Delaware, N. J.

The reports from this and surrounding vicinities are to the effect that the Spring brood of chicks is only about 50 to 60 per cent of the usual crop. We have had so much cold weather that the young perish after hatching, while from some cause (which I am not able to explain), the hatches have only been about 60 per cent, some running as low as 15 to 20 per cent. Some breeders have not been trying of late to run their incubators on account of early failures.

HENRY WALLINGFORD.

Bonaparte, Iowa.

Reports from my customers show that very early in the season eggs were not hatching well, but after the fowls got out of doors hatches were good and chicks strong. The season has been backward, wet and cold, and as a rule people in this vicinity have fewer early chickens than usual, and are trying to make up with late ones. We have out about 2,000 chicks, and expect 500 more soon. Our own chicks are very strong, growing finely, and the prospect is good for a fine lot of birds next Fall, although the adverse season has made it more difficult than usual to care for them.

H. J. BLANCHARD.

Groton, N. Y.

A Lame Horse

is neither valuable for use or sale. It is better not to have a lame horse.

Tuttle's Elixir

cures permanently all forms of lameness, curbs, splints, sprains, thrush, &c. Equally good for internal use for colic, founder, pneumonia, distemper, &c. *Guaranteed to cure.*

Used and Endorsed by Adams Express Company.

Tuttle's Family Elixir cures rheumatism, sprains, bruises, etc. Kills pain instantly. Our 100-page book, "Veterinary Experience" **FREE.**

Dr. S. A TUTTLE, 30 Beverly St., Boston, Mass.

Beware of so-called Elixirs—none genuine but Tuttle's. Avoid all blisters; they offer only temporary relief if any.

NO SPAVINS

The worst possible spavin can be cured in 45 minutes. Curbs, splints and ringbones just as quick. Not painful and never has failed. Detailed information about this new method sent free to horse owners. Write today. Ask for pamphlet No. 34.

FLEMING BROS., Union Stock Yards, Chicago, Ill.

Farm Blacksmithing.

An illustrated book written expressly for farmers. It tells all about making and tempering steel tools, making chains, hooks, rings, clevises, bolts, etc., etc. Filing saws, splicing rope, shoeing horses. Price 50c., cloth bound, by mail post-paid. Address J. M. DREW, St. Anthony Park, Minn.

Mailed anywhere for 50 cents.
MOORE BROS., Veterinary Surgeons, Albany, N. Y

Death to Lice on Hens and Chicks. 64-page Book FREE.
D. J. LAMBERT, Box 307, Apponaug, R. I.

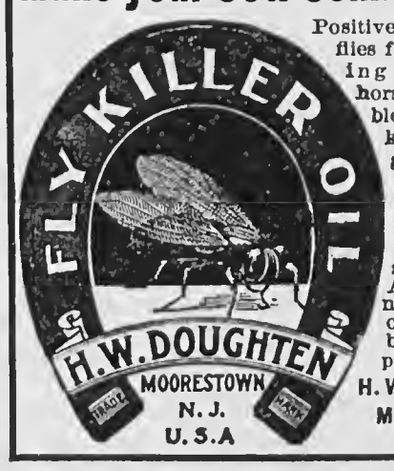
ZENOLEUM Kills Lice, Ticks, Mites, Fleas, Etc., on all kinds of animals and poultry. Given internally it drives out worms. Cures all cuts, wounds, sores, etc. Non-poisonous. Endorsed by leading veterinarians. "Veterinary Adviser" free. Zenner Disinfectant Co. 100 Bates St. Detroit, Mich.

ORR'S FLY KILLER IS THE BEST
Kills Flies and Lice on Cattle and Horses.
Gives Cows Comfort, hence more milk.
Keeps Flies off Horses, hence more work.
Purifies the Stable, hence health and safety
One gallon can $1, and Keystone Sprayer $1, both **sent express prepaid for $1.50,** to introduce it. Five-gallon can, freight prepaid, $4 00.
T. E. ORR, 563 Liberty Street, Pittsburgh, Pa.

SHOO-FLY The Animal's Friend
Kills every fly it strikes; keeps off the rest. Harmless to man or beast. ¼ cent's worth saves 3 qts. milk and much flesh. Send $1.00 for Improved Sprayer and enough Shoo-Fly to protect 100 cows, or 25 cents for liquid alone. Guaranteed
SHOO-FLY MFG. CO., 1005 Fairmount Ave., Philadelphia, Pa.

THE FULL MILK PAIL
attests the value and is the sure result of the use of our
NEW CENTURY FLY KILLER OIL.
There is no "fly time" where it is used. Absolutely safe—harms neither man nor beast and will not taint milk. It is most evenly and cheaply applied with our **Special Sprayer.** Calves and young stock can't thrive and grow if continually fighting flies. It's equally valuable for horses. Prevents "fly nervousness" and has saved many a "run off" and "smash-up." Ask your dealer for it. If not there, send $1.00 to us for Sprayer and enough Killer to protect 150 cows or other animals. We are the sole manufacturers and want agents everywhere.
D. B. SMITH & CO., UTICA, N. Y.

Make your Cow Comfortable



Positively prevents flies from annoying cows or horses; rids stable of flies, keeps stock good tempered and in fine condition. A boon to every stock owner. Apply to your nearest dealer or write for booklet and prices.
H. W. Doughten, Moorestown, N. J.

CHEMICAL CHANGES IN THE SILO.

What Takes Place in Silage?

THE AIR "BURNS."—When silage is first cut into the silo the live tissues of the plant remain active for a considerable length of time, and rapidly consume the oxygen contained in the air which is carried into the silo with the cut material, so that in a comparatively short time nearly or quite all of the oxygen has been removed from the air, and in its place has been developed carbon dioxide, and probably more or less of other gases. If the silo is sufficiently tight so that no air can enter from the sides, and none can enter from above, the rapid action which occurs at first nearly ceases, and from this time on only comparatively small changes take place, which result in the production of substances in the gaseous form. What changes may occur after this in the silo which result in the formation of liquid or solid substances have not yet been determined, but it is certain that in the silos of airtight construction the changes are so small that the total loss in dry matter from well-matured corn silage need not exceed 1½ to four per cent after a period of standing as long as six months or even a year.

CHEMICAL CHANGES.—No one has satisfactorily demonstrated just what products are produced in the process of siloing. It is known that carbon dioxide is given off at first in quite large quantities. We have demonstrated that for a time at least considerable quantities of some combustible gas are also given off, though Drs. Babcock and Russell did not find evidence of this in their experiments. In addition to these gases considerable quantities of acids are developed, especially if the corn is put into the silo a little under ripe; that is, before the kernels of corn are well matured and the sugars and other less stable compounds have been transformed into the more stable compounds which occur in the kernels. The causes which produce these changes have not yet been thoroughly demonstrated. The observations made by Drs. Babcock and Russell indicate that the bacterial action is not as great as it has formerly been supposed in the cases where air is completely excluded from the silage, and it is their opinion that direct chemical changes whose nature is not yet fully demonstrated may take place and be responsible for the larger part of the first heating, and perhaps to the subsequent changes which take place in the silage, rather than to the type of fermentation which bacterial organisms are known to produce.

LOSS IN OPEN SILOS.—To whatever causes the changes which occur in the green materials put into a silo may be due, this is satisfactorily demonstrated: Wherever air is entangled in the silo in large quantities and under whatever conditions air may be admitted to the silage after it has been put into the silo, losses in dry matter inevitably occur, and the products which are produced are to a considerable extent of a gaseous nature, and the more thoroughly oxygen is excluded the smaller the inevitable losses are likely to be. This proposition we have demonstrated abundantly in our own observations and experiments made both in actual silos, and in small vessels ranging from a pint in capacity up to those holding 1,500 pounds of silage. In every one of our numerous trials where the air has been thoroughly excluded, there the losses in dry matter as gaseous products or those which are volatile when the sample is dried in the dry oven have been small, but where the air has had access with any degree of freedom there have been losses of dry matter ranging from 10 up to 30 and 40 per cent of that put in.

One of the strangest sets of facts which we have obtained in our experimental studies is that a given sample of corn may undergo such changes as to amount to 18 and even as high as 25 per cent of the dry matter in the sample, and yet the sample viewed from its external appearances and its taste may resemble silage of fairly good quality which has sustained a loss of less than 10 per cent. This is a very important observation which practical men should keep in mind, because it is undoubtedly the fact which leads many who are using the cheaply-constructed stave silos, which are known not thoroughly to exclude the air from the silage, to feel satisfied with the results which they get in the apparently good silage taken from such silos. The observations which we record in our last bulletin prove conclusively that large losses do occur in the stave silos as the result of air finding its way between the unjointed staves, and yet the silage appears fairly good, and the cattle eat it with relish, as they do that which has sustained a much smaller loss of dry matter.

AIRTIGHT BEST.—It must of course be admitted that no observations have yet been made of the feeding value of silage which has sustained a loss of from 15 to 20 per cent of its dry matter, and that which has sustained a loss of only 1½ to two per cent of its dry matter, and hence no rigid conclusion can be drawn as to how much the actual saving is in the thoroughly well-constructed silos over those which preserve the silage in moderately good condition, so that it does not develop the undesirable odors, and has not seriously molded or decayed. In the absence of such evidence, however, it is safest for practical experience to be guided by the supposition that the feeding value of silage which has sustained the smallest loss in dry matter is a better feed than one which has sustained the heavier loss, and the conclusion that only well-constructed silos, such as are known to be permanent in their essential features, and are known to possess the power of excluding air from the silage are the only safe ones for practical men to follow. If it is true that a thoroughly good silo will save from five to 10 per cent of the feeding value of the silage put into the silo more than the poorly-constructed silo will save, there can be no question about the desirablity of going to a somewhat greater expense to secure the conditions which will make the small losses possible. [Prof.] F. H. KING.

Wisconsin Exp. Station.

The preparation which I use is So-Bos-So Kilfly. This preparation will keep flies from live stock, and I find that my cattle which I used it on are free from warbles this Spring. While using this preparation we have some things to look to, namely, to keep it from penetrating the milk. We have never had any bother with it, but in the first place we milk and strain, and have everything put in place before spraying the milch cows. Where care is taken I think there is no danger of the milk being tainted. I have also used Kilfly on my hogs, which will rid them of lice, but for lice on hogs I like a light application of crude oil the best.

Noblestown, Pa. H. M. K.

A GROUP OF DUAL-PURPOSE COWS. FIG. 209.

Cleaning the Stable.

Some one asked through THE R. N. Y. for a device for cleaning stables. Where the stable is built with considerable space behind the stalls (mine is seven feet), and with a door at one or both ends of the space its full width, I think the following will be found the quickest and easiest of any. Spread a wire cloth the width and length of the space on the floor when it is clean, and cover it with straw or other litter, and leave it there until you wish to clean out. Then hook the end of the wire carpet that is by the door to the doorsill and hitch a horse to the other end and drive him over the wire, and out of the door the wire cloth rolls, taking all the manure with it, and unloads it just out of the door. By putting some inclined plank from the door to top of wagon, and lengthening the carpet, it can be unloaded into the wagon. Of course then one would have to use a rope to hitch the horse to, long enough to reach the length of the stable and out over the wagon. I presume that tarred rope matting would work as well as the wire cloth while it remained sound. I don't know how long it would last used in the stable. Of course the carpet must be put down again at once and covered as before. C. C. C.

Dowagiac, Mich.

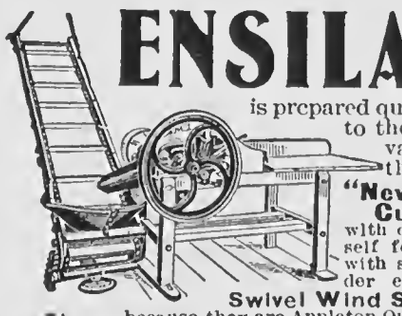
R. N.-Y.—We have heard of one case where a wide scraper was used. A horse was hitched to this scraper by means of a long rope and with a man behind to guide the scraper the manure was all pulled out.

Butter and Cream Fat.

What amount of butter is contained, or can be made, from one gallon of cream, containing 30 per cent of butter fat? I wish to figure out the relative value of cream and butter on that basis, so as to decide whether to sell cream or butter.

Whitewood, S. D. T. E. B.

One gallon of cream containing 30 per cent fat will produce 2¾ pounds of butter if the cream has been carefully ripened and exhaustively churned. Selling butter at 20 cents a pound would make a gross return of 55 cents; deducting average expense of manufacture of .03 per pound butter would leave a net per gallon of cream of 47 cents. A very safe and accurate rule for computing the butter value of milk or cream is found by multiplying the pounds of milk or cream by its per cent of fat, and then add .15 to the product. My experience has not warranted an excess of butter over butter fat to exceed the above amount. Careful experiment has shown that butter fat cannot assimilate to exceed one-half of its own weight of water. Butter contains a small per cent of foreign matter which just about balances the loss in separation and churning when it has been as complete as present machinery and skill can make it. When the excess runs under 10 per cent or over 17 per cent something is out of gear in the method. Many tests are figured on a basis of 80 per cent fat; this calls for 20 per cent excess, which does not correspond with actual creamery practice. H. E. COOK.



ENSILAGE

BIG PROFITS IN FARMING.

WHAT A CHICAGO CITY FARMER DOES.

Is His Plan Practical?

We have received the following note from a good friend in Canada:

"In the Saturday Evening Post of June 8, page 8, an article appeared on 'Big Profits of Twentieth Century Farmers.' So bright a view of what is coming, if not indeed actually available now by good management, might serve to dispel the gloom resulting from such long continued rain and absence of sunshine. The contrast between that article and Hope Farm Notes is very striking. There must be some mistake on the one side or the other. According to one farming is as easy as turning your hand over, if you will but adopt and stick to a simple rule or two, while the other would have you believe that you will meet lions on the path at every turn, so that you never can tell where you are going to come out. There is all the difference between the two that there is between a fancy picture and the plain homely reality of everyday life, or between prose and poetry." W. O. E.

The article in question was written by S. W. Allerton, who operates farms by telegraph, mail and telephone from the city. He says he has over 40,000 acres in careful cultivation, and about the same area in grass. There are over 70 different farms, each managed by a foreman and reached by long-distance telephone. Mr. Allerton says he has one farm of 3,600 acres which cost him $70 per acre, and which paid $37,000 profit in one year. A fair statement of what the author claims may be found in the following quotation:

"Here is my allotment for a farm of 160 acres: Ten acres for buildings, garden patch and a field of mangel-wurzel beets; 60 acres for pasture; 60 acres for corn; 30 acres for oats. In the second year these crops should be shifted, pasture and grass lands being turned over for cereals. The beets should be fed to sheep and hogs, and as much will be realized from the sale of wool, lambs and hogs, under this system, as would otherwise be secured from the entire product of the farm. The showing made by an intelligent following of this plan should be fully as good as this: From sale of wool, $100; lambs, $500; hogs, $500; corn, $900; oats, $200; total, $2,200.

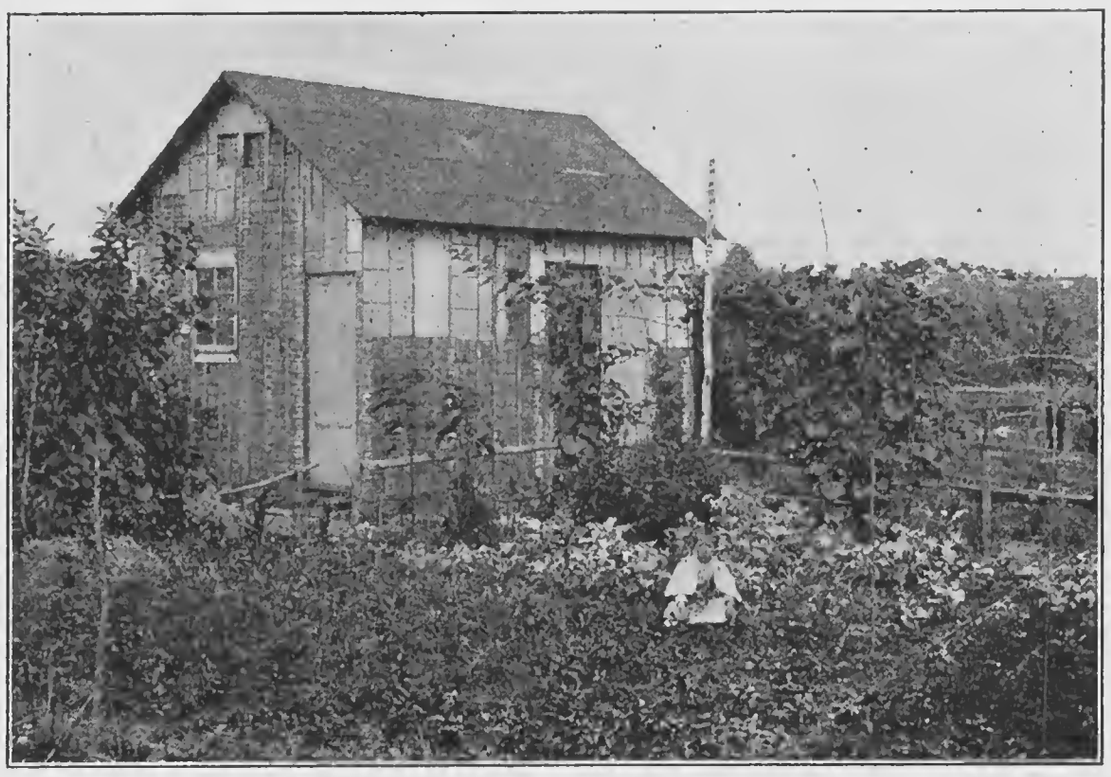
"This allows for feeding 1,500 bushels of corn out of a crop of 4,500 bushels; the corn being figured at 30 cents a bushel, and the yield at 75 bushels an acre. The number of lambs in this estimate is 100, and hogs 50. Placing the farmer's outlay for expenses at $700, this leaves him $1,500 clear. I believe this to be a very conservative estimate of what any good farm may be made to pay, for I have generally exceeded this figure in the net results of my farming."

Mr. Allerton talks as though this ought to be done on any farm. Of course, he is referring to the Middle West and, we presume, to level land of good quality. No doubt the Hope Farm man will have his say later regarding this rosy-cheeked view of agriculture. We have asked for the views of some thoughtful eastern men who have had experience at farming, and a good chance to observe actual conditions. We print letters this week from two of them. We consider it wise to get down close to the actual condition of farming as a business that we may hunt for the influences, if there be any, that operate against the farmer.

PENNSYLVANIA COMMENTS.—It is always well to have in mind the possibilities which well-directed effort along any particular line of work may reach, yet these same possibilities should be kept entirely distinct, and considered entirely separate from the probable returns which will accrue from well-directed efforts of any considerable number of men who are recognized in a sense as leaders in their respective vocations. It must be admitted that the conditions under which Mr. Allerton is enabled to conduct his farming operations are entirely different from those confronting the average farmer of the Middle and New England States, and that his operations may be carried on under the conditions with which he has to deal in a much more satisfactory manner from a financial standpoint than would be possible on the uneven land of the Eastern States. It should be remembered that Mr. Allerton's profits are in no small degree secured from the business of a middleman. By virtue of his position he is enabled to save the profits which the most successful middleman would make in handling like products purchased from farmers While Mr. Allerton's estimate of $1,500 as the net profits of a 160-acre farm may be well within the range of possibilities, yet if he had given the actual returns from a farm of this size for a number of consecutive years the figures would undoubtedly have carried much more weight. It is undoubtedly true that there are many farms in nearly every State that produce annually from 160 acres an amount that exceeds the prediction of Mr. Allerton, yet these farms are managed by men who are specialists, and cannot be said to belong to the great rank of average farmers who practice mixed husbandry. There are specialists in various lines of farm work who are undoubtedly receiving greater income from fewer acres than those stated by Mr. Allerton. These undoubtedly show the possibility of intensive agriculture, yet they should not be placed before the average farmer in a way to mislead him. The average farmer of Pennsylvania and New York who is now practicing mixed husbandry will undoubtedly accept Mr. Allerton's estimate with a good deal of hesitation.

[Prof.] G. C. WATSON.

Penn. Exp. Station.



A PIONEER FARMHOUSE IN NEW JERSEY. FIG. 210.

BARN AND SHED ON A MARSH FARM. FIG. 211.

THE CONDITION IN MAINE.—Mr. Allerton's article in the Saturday Evening Post is based upon agriculture in the West and not in the East, and I do not pretend to be familiar with the situation there, but at this distance the article seems to be largely "buncombe." In his argument for an Illinois farm of 160 acres, he claims sales from wool, lambs, hogs, corn and oats to the amount of $2,200, and aside from his own personal labor he only claims a cost of $700 to cover interest on investment, taxes, machinery, equipment, blacksmith bills, hired help, etc. It is doubtful whether the high farming which he claims to carry on, by which he produces 75 to 100 bushels of corn per acre, is equaled on the best farms in Illinois one year with another. While he says he is talking of ordinary land of Nebraska and Illinois, he is not talking of ordinary land, but of the very best, and I am sure that such land has a high selling value there. Is it not true that farm land in Illinois that is capable of yielding the crops he indicates has a selling value of $100 an acre? One hundred and sixty acres of land at this price would bring $16,000, and four or five per cent on such a farm would alone mean as much as this $700 which he sets aside for total expenses. He speaks of Summer fallowing as an important part in his scheme. But he must know, if he is in touch with modern agriculture, that while Summer fallowing was once the most popular article in the creed of the theoretical and practical farmer, this practice has gone by, and that land is no longer kept in fallow, but is kept covered with some green crop as much of the time as possible.

Aroostook County, in this State, is the only part of New England which has conditions at all analogous to the West, where farming is carried on with a few kinds of crops and on a large scale. While I know of some farmers whose cash sales from 200 to 300 acres

will in favorable years amount to $3,000 or $4,000, I know of a great many more who are not doing anything like this. In talking with practical men, both farmers and business men in Aroostook County this last week, the consensus seems to be that to every farmer who is receiving $1,200 or more in net cash from 200 acres of land, there are 25 who are receiving much less. Of course, in this, I am neglecting, as Mr. Allerton did, the value of the living which the farmers are so largely getting out of their farms. While agriculture is a safe business, and while there is an opportunity for the *average* farmer to make a comfortable living, and an opportunity for the man who is above the average to make more than a good living and lay up some money, the farm is not the place, in my opinion, in which a man should look for wealth. Men who get wealthy in the modern sense are exceedingly few in any calling, and they are not, to my knowledge, found in legitimate practical agriculture. [Prof.] CHAS. D. WOODS.

Maine Experiment Station.

FIVE ACRES ENOUGH! FOR WHOM?

A short time since we printed a note from a reader who argued that five acres of land is ample space on which to support an average family. There are few five-acre tracts about our own farm that would provide all that the average American family deems necessary for life and comfort. The pictures shown at Figs. 210 and 211 show how foreigners attempt to make a living on a small lot of land. These buildings were to be found in Bergen Co., N. J., within 10 miles of New York. The great Hackensack marsh extends for miles inland. On the upper part of this marsh, where the hills rise abruptly to the higher land there are little settlements of foreigners—chiefly Italians and Poles. These people seem to be more or less immune to malaria or mosquitoes—at least they live in this damp, swampy region and are able to work hard. The hut shown in our picture was built by an Italian—the other building contained part of his corn crop, a pig, a goat, a number of hens and various tools. The material was mostly obtained from old buildings—the sides of the shed being formed from old steel and tin from a discarded roof. In this humble dwelling the man, his wife and several children started. To their credit be it said that they have since then built a substantial house with high brick walls, while the old dwelling house now shelters a cow and a small horse.

This sour and soggy soil formed a most uninviting spot out of which to try to dig a living. We do not know a single American farmer who would have attempted it. Some of them might have gone West, away from old friends and associations, and tried the swamp rather than the poorhouse, but we do not know of one who would have gone down from the higher ground in New Jersey to work after the manner of this Italian. Probably few Americans with several generations behind them on this side of the water could have done what these European peasants had long been accustomed to do. Rain or shine, early and late, through bleaching sun or soaking fog man and woman were at work. They were true beasts of burden. They used no horse tools at first, but chopped up the tough sod with heavy hoes, such as the negro laborers at the South use in the cotton. They ditched and dug and planted and hoed until they conquered their little piece of ground and made it produce wonderful crops of onions, cabbage and celery, which they carried on their backs to market, carrying back, if need be, any form of filth that would add fertility to the soil. They bought stale rye bread by the barrel. This, with coffee, onions and other vegetables provided most of their food. A glass of beer on Sunday and visits with friends provided their recreation. That is the way in which the soil was saved and the home was made. It was pioneer life in New Jersey. Perhaps some of our readers who, years ago, went out into the western wilderness could match this record of dull, weary toil, with stories of their own lives in sod house or log cabin. We doubt, however, whether the children of either the western pioneer or the foreign drudge can ever be induced to do as their parents have done. In other words, while this Italian family has prospered on a very small area, it is not likely that the children, when they come to face the serious problems of life, will be satisfied to remain within the narrow limits of the little farm. This might have been possible in France, Italy or parts of Germany, but the very things which lead our people to glorify the superior intelligence and ambition of Americans will prevent the foreigner's son from being satisfied with that form of a living!

THE best horse forage we can plant now is fodder corn. The flint varieties will give an immense yield before frost. When cut or shredded such fodder is as good as hay.

CHEMICALS, CLOVER, COWS AND LIME.

Some Methods and Results Analyzed.

PART III.

CORN.—This is one of the most important crops in Mr. Lewis's rotation. In making the statement of farm sales on page 450, a mistake was made in the item of "cows, $251.76." This should have been *corn*, and the amount given indicates the cash sales of this grain after feeding what the stock required, and the stalks. The sales of wheat were $282.57. The sales of corn from a much smaller acreage were only $30 less, and besides this the cornfield grained the stock and filled the silo. This gives a good idea of the comparative values of corn and wheat in such farming. In former years the wheat made a better comparative showing, because less attention was given to utilizing the cornstalks. As has been stated, all the farm manure is spread on the two-year-old sod for corn. The ground is handled in the usual way—the corn being planted in hills. The corn for the silo is grown in the regular cornfield—the only difference being that on the part intended for grain two or three good stalks are left in the hill, while five stalks are left in the silo crop. Some farmers say that they want their silo corn grown just like that intended for grain, as they want plenty of ears in the silo. Others reason that the silo is the place for *stalk*—that it pays better to raise more stalk on a smaller area, and buy bran, cotton-seed meal or linseed to feed with it. Within the last few years Mr. Lewis has practiced sowing Crimson clover in the corn at the last cultivation. In the seasons when it makes a good start this clover provides good Fall pasture for the cows, and in any event, makes a better fitting for the potato crop—which follows the corn.

WHEAT.—It would not be possible to follow this rotation exactly as far north as central New York. In that section potatoes are planted late, and late varieties are used, so that they could not be dug and

APPLYING PARIS-GREEN ON POTATOES. FIG. 212.

the land cleared in time for wheat seeding. Early or medium varieties are grown at Cranbury, so that they may be all dug and shipped usually before September. As a rule, potatoes in this section are not stored, but the general practice is to sell directly from the field as fast as they are dug. One season with another this probably pays better than to try to hold the crop for a higher price. Thus the ground is quickly and readily fitted for wheat. It cannot be said that wheat is a very profitable crop. The wheat field returned $282.57 and the straw, while about the same sized field in potatoes gave $829.54, and about twice the area in grass gave $831.81. Yet these farmers continue wheat as a part of their rotation. They say that they need the straw, they prefer to seed to grass in the grain, and after all there is less chance of failure and loss where the risk is divided among four crops rather than three. I have met farmers in south Jersey who have dropped the wheat out of this rotation, and grow potatoes, grass and corn—seeding to grass alone. They claim to make a saving by this change. They depend more on clover and usually have some outside crop, like asparagus or tomatoes.

GRASS.—After all this is the backbone of farming—chemical or stock. Mr. Lewis has good grass—some fields averaging three tons per acre of well-cured hay. Since he began to use lime the prospects are good for better clover. I think the clover will respond quicker to lime than either Timothy or wheat. Since the herd of cows was increased some changes in farming have become necessary. For example, part of each potato field is given to oats and peas. While this crop is maturing, grass is cut for green feeding right out of the clover field, and thrown over the fence into the barnyard for the cows. As I have stated, the silo has so increased the feeding value and availability of the cornstalk crop that little if any hay is required for the cows. It is nearly all sold. This practice is opposed to what many farmers call the first principles of agriculture, for they hold that stock food should never be sold from the farm, but consumed at home, and the manure put on the ground. This is sound doctrine in many cases, but not in all. Where a farmer can sell a ton of hay, so that he can buy all the fertility it contains in bags and have a profit left over, it often pays to do so. I will not say *always*, because practical people know that there is no cast-iron rule in farming. Mr. Lewis believes that it pays to sell the hay and use part of the money to buy fertilizer for use on the potatoes. It would not pay to sell the stalks, for they would not bring money enough to purchase the fertility which they contain. We like to discuss this system of farming and rotation because there are no special crops like truck or fruit. It is plain farming—the production of staple crops in an orderly and scientific manner. It seems easy, but let no man deceive himself into thinking that brains and skill of a high order are unnecessary to conduct such a farm. H. W. C.

THE AGRICULTURAL EXPERIMENT STATIONS

We are often asked to print a list of the American experiment stations. We therefore reprint from an official bulletin a map showing where the stations are located and a list of addresses:

Alabama, Auburn, Uniontown. Arizona, Tucson. Arkansas, Fayetteville. California, Berkeley. Colorado, Fort Collins. Connecticut, New Haven; Storrs. Delaware, Newark. Florida, Lake City. Georgia, Experiment. Idaho, Moscow. Illinois, Urbana. Indiana, Lafayette. Iowa, Ames. Kansas, Manhattan. Kentucky, Lexington. Louisiana, Audubon Park; New Orleans; Baton Rouge; Calhoun. Maine, Orono. Maryland, College Park. Massachusetts, Amherst. Michigan, Agricultural College. Minnesota, St. Anthony Park. Mississippi, Agricultural College. Missouri, Columbia. Montana, Bozeman. Nebraska, Lincoln. Nevada, Reno. New Hampshire, Durham. New Jersey, New Brunswick. New Mexico, Mesilla Park. New York, Geneva; Ithaca. North Carolina, Raleigh. North Dakota, Fargo. Ohio, Wooster. Oklahoma, Stillwater. Oregon, Corvallis. Pennsylvania, State College. Rhode Island, Kingston. South Carolina, Clemson College. South Dakota, Brookings. Tennessee, Knoxville. Texas, College Station. Utah, Logan. Vermont, Burlington. Virginia, Blacksburg. Washington, Pullman. West Virginia, Morgantown. Wisconsin, Madison. Wyoming, Laramie.

It will be seen that several States have more than one station. There are in all nearly 700 persons employed at these stations and at least four bulletins are issued during the year from each one. Most of them issue a dozen or more. The work done by the station workers is quite varied—much of it being devoted to the investigation of local problems. For example, the stations in Ohio, Maine or Wyoming will be most likely to study the peculiar problems which affect the farmers of those particular States. As a rule, it is possible for anyone to obtain bulletins. As we shall not be able to repeat this list soon we advise interested readers to keep a copy of it.

HORSE SHOE FARM NOTES.

SEEDING WITH BUCKWHEAT.—Buckwheat is, on good ground, a rank grower, and shades the ground so completely that grass and weeds have but little chance to make any growth. It is called a good crop to clean land with on this account. The grass seed has to be sown out of season, too late for Spring rains and too early for the natural time in which Timothy usually sheds its seed. Where considerable care is taken to prepare the soil the seed is covered with a smoothing harrow, and the surface firmed with a roller, the grass seed will germinate well; but if it survives the dry weather and dense shade of the buckwheat it will be very small and tender when Winter comes. By Spring many of the plants will be killed and thrown out by the frost. It is the exception, and not the rule, to obtain good results from seeding with buckwheat in this section. The chances are much greater if the buckwheat is sown very thin, but this reduces the yield and leaves no profit. Not more than one-third to one-half bushel per acre should be used. Use a grain drill, sowing with only half the teeth, making the rows 14 inches apart. On rich land which will force a good growth of the grass after the buckwheat is drawn off, and where there will be little danger of heaving out by frost in the Spring, there is a fair chance of success. On poor land, dry hard clay or land hastily prepared, the failure is quite sure. The yield of buckwheat will, if not ruined by frost, be disappointing if the sowing is delayed much longer. The early sown of late years has given much the best yield.

"NATURE'S" CARE.—The notice in THE R. N.-Y. to "Stop planting and care for what you have in the ground," applies to late-sown buckwheat, except when Nature wishes to upset our theories. Mr. Collins, page 457, thinks "Nature plants only twice the thickness of the seed. If deep the plumule is slender and weak." Nature, it seems to me, is very slack in her planting, and has no rule. Not one seed in a hundred, planted by Nature, grows. She blows a little dust over them, they drop into a deep crack, water carries them into deep mud, and here and there one escapes destruction. I do not know where he got the rule given, and think it is man's, not Nature's. Anyway, it will not hold good for all seeds. Potatoes planted deep, four times their diameter, will show a thicker, stronger stalk, and give a larger yield, than shallow planted. Bulletin No. 191, Cornell, just out, gives many results on the question of deep vs. shallow planting, which should interest potato growers. The results obtained by Mr. Stone's efforts are very instructive, and from long acquaintance with him I know they are *actual results* to be depended upon, not fixed up, as is sometimes done, to make a big showing. Send for it and study it. Beet seed sown by this rule would under very favorable circumstances germinate, but for best results should be an inch deep, and if very dry deeper yet.

C. E. CHAPMAN.

MODERN CRANBERRY CULTURE.

ESSENTIAL PRINCIPLES OF THE BUSINESS.

How to Start a Bog.

PART III.

SUMMER WORK.—The first Summer after a bog is set out it should be gone over once every week, and all weeds and bushes pulled up and carried off. For a month after setting the water should be kept as high as possible in the ditches. If the vines are slow in starting a teaspoonful of fertilizer should be dropped upon each hill. Keep the weeds and brush mowed around the bog, and if possible have a road around it.

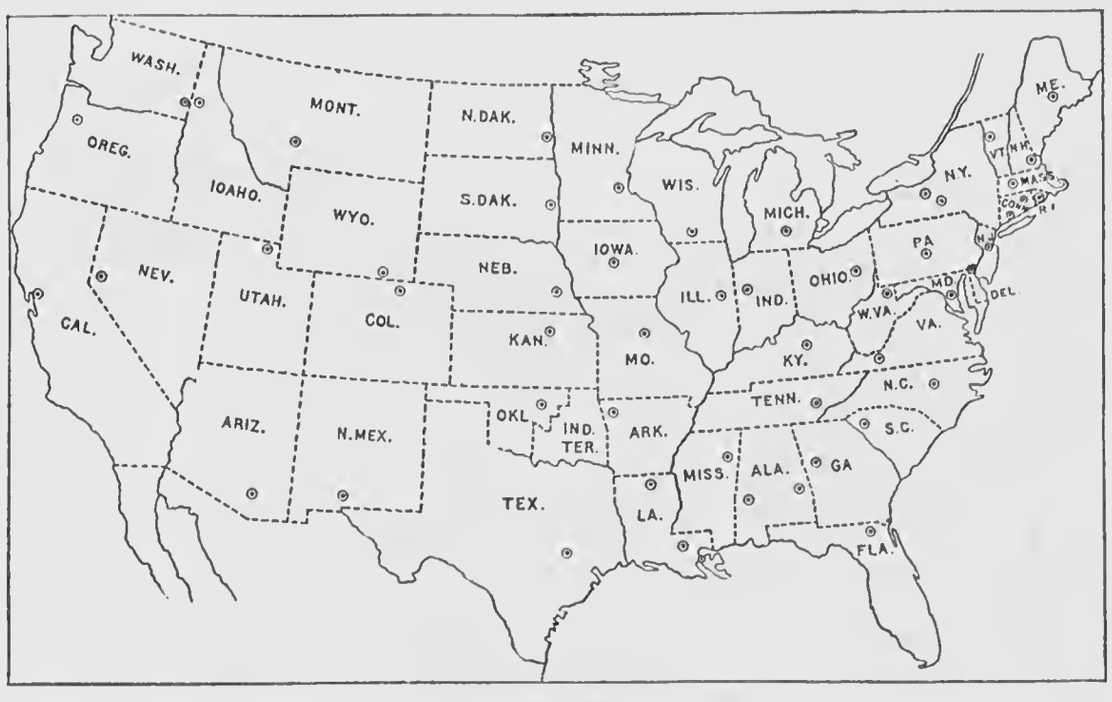
INSECTS seldom trouble a bog until it is fully vined over and not always then. The insects that do the most damage are the fire worm and the fruit worm. The fire worm, (so called because the vines destroyed by it look as if they were burned) eats the roots of the vine, causing the tops to turn red and die. It is no use to try to kill this insect by spraying with poisons, because the poison will not reach it. It is eating away under the sand, safe from all liquids but one, and that is water. Nothing but flowing will put an end to the fire worm, and the water should stay on all Winter. Fortunately, the worms are slow workers, and they generally confine themselves to a small portion of the bog. They do not get on every bog, and a grower might be in the cranberry business 20 years and never be troubled with them. In a region where there are but few bogs they are seldom, if ever, seen. The fruit worm gets into the flower and grows with the fruit. A good spraying with Paris-green, hellebore or tobacco just before the flower opens, will prevent it from doing any damage. However, as insects do not trouble young vines, a beginner in cranberry culture need not trouble himself about them.

THE SECOND YEAR the vines ought to spread considerably, and in the Fall there should be on each acre a few barrels of very handsome berries that will bring, if properly packed, the top market price. Where the crop is small, it is a good plan to ship in crates, each one holding a bushel, and to ship as soon as picked. The work of screening and packing can be done out of doors, and at night the fruit is covered with a canvas. It is well to build a cranberry house the third Summer, and its size should depend on the number of acres of bog. Where the crop is likely to be a thousand barrels a house that is 20x30 feet, with 14-foot posts and a square pitch roof is large enough. There should be plenty of windows in it for ventilation, and it should be set on a piece of ground high enough so that water will run away from the house. A building of this size can be built cheaply and by anyone who is at all skilled in the use of carpenter's tools. A good way to do it is to lay two sills (4x6 is large enough) lengthwise and then put on 2x6 floor stringers 16 inches apart on centers. Floor this all over, and then set posts and studs on top of floor. Where the windows are going to be, leave room enough between the studs for the sashes. In this way it saves the expense of window frames. The doors should be sliding ones, and hung on the outside, one on the front end and one on each side. There should be a sliding door on the front end of the upper story, so that empty barrels and boxes can be put up there from the outside. The steps from the lower to the upper story should be in one corner, and hinged at the upper end, so that they can be hung up out of the way when not in use. As there are likely to be from 30 to 50 barrels of berries per acre the third Fall, it is necessary to make some definite arrangements for screening and packing.

MACHINERY.—Of course nearly all growers use a separator, which is a machine fan and dropping arrangement inside that will throw out dirt, stones and rotten berries. This machine works with a crank, and is turned by hand. If the berries are dry—and by the way, berries should not be picked when they are wet with dew or rain—a man can run through 30 or 40 barrels a day, which is enough to keep two screens going. When we speak of a screen, we mean one that is large enough for five women to sit around and look over the berries. This means one screener at the mouth of the screen, who is called the runner, and two other screeners on each side. Most growers build their own screens, and they are easily made of narrow strips of pine nailed one-fourth of an inch apart on the bottom of a three-sided frame that is six inches high, tapering from four feet wide at the top to eight inches wide at the lower end, and 10 feet long. This is set up on horses with the lower end just a little higher than a barrel, and the upper and wider end about eight inches higher still.

PICKING AND SHIPPING.—Many growers ship their berries in ventilated barrels, and where early shipments are made this is a good idea, but if berries are to be held for late shipment they should be put by the pickers into bushel boxes and piled up, dirt and all, in the cranberry house, and left untouched until ready to screen for immediate shipment. They should have plenty of air and, unless it is freezing, doors and windows should be left open.

It is better not to harvest with a scoop until the bog is fully covered by the vines, which it ought to be by the fourth year. The first year a scoop is used many berries will be dropped on account of long runners which will pull up and tangle in the teeth of the scoop. But the berries can be picked up and after the harvesting is over the runners can be raked up, cut off and carried to the upland. Don't be afraid of injuring the vines, for such a pruning does them good. The next Fall there will be plenty of new shoots that have grown, and they will be all uprights. By raking out the runners each Fall after harvesting, a grower will soon have nothing but upright vines on it, and he will have good crops that can be easily scooped. Cranberries will not grow on runners, and a scoop will not work in them, hence, it is best to get rid of them as soon as possible. There are many objections to the scoop on the prineiple that it injures the vines. Of course a seoop will pull up runners, but runners are the deadheads of a cranberry bog. They will not bear fruit, and they cover fruit from the sun, so that it is likely to root before ripening, and if there is anything that will pull them up it is a good thing. Heavy vines will not bear heavy crops, but thin vines, if all uprights, will bear large berries and plenty of them. What is more, the sun has a chance to shine down among them, and ripen the fruit early and evenly.



MAP SHOWING THE LOCATION OF EXPERIMENT STATIONS. FIG. 213.

ODD POINTS.—When intending to keep cranberries a few weeks before shipping, it is well to pick them a little green. They will ripen in the boxes, and will keep much better. Handle them as little as possible, and never screen them until ready to ship. Where the bog can be flowed in Winter, it is a good plan to flow as early as the middle of November, and keep the water on until the first of April. When vines are seven or eight years old, sprinkle about half an inch of sand among them in the Fall after harvesting, and spray with the juice of tobacco stems in the following Spring. To get rid of old vines and start a new variety, it is best to burn them off, resand and then set out the new kind. If the vines are old and do not bear fruit, and it is desirable to continue the same variety, mow them off like grass, and in two years the bog will be covered with new shoots. There is much more that might be written about cranberry culture, but I have done all I intended, and that was to give a description of practical methods now in vogue among growers, for the use of beginners. A little experience will teach a grower more than one could tell him, and I hope that these articles will give him a start in the right direction.

F. A. MAKEPEACE.

HARD CONDITIONS AND COWHORN TURNIPS

A Short Sermon from Two Rival Texts.

The account of successful reclaiming of hopelessly poor soil by means of the Cowhorn turnip (R. N.-Y., April 20, page 286) will prompt many readers to experiment with that unusual crop. The conditions of our New England farming allow of no particular staple crop, unless it be the grass crop. With $20 hay the past two seasons, what an incentive, could the farmer have had timely foresight, and been prepared to sell hay! Still, the hay must be kept and fed out if fertility is to be kept up. The problem is, how both to keep the stock and still sell the hay, and the solution is to double the yield of grass, producing the former amount from half the area, and keeping the other half in such a rotation of tilled crops as will support the stock. Each successive Spring we read the same lesson from the published crop outlook: "Grass light except in fields newly laid down." The average mowing land is yielding but about one-third of a full crop, according to our newer knowledge of grass culture. To sell the hay from one-half the arable land and Winter-feed the usual number of stock from the other half, would transform many a hopelessly encumbered farm to a condition of prosperity, bring back the owner's courage where it is now on the wane, and make a sweeping change for the good in the history of families.

Quoting my other text from the Brevities in the same issue, "The best work most of us do is squeezed out of us by the pressure of hard conditions." Now, the hard conditions of New England farming have brought about the abandonment of many worthy farms, it is true, but have not materially injured those who stuck manfully by the farms. Easy prosperity has been the rock upon which so many wrecks have foundered. I live just out of a town which a dozen years ago was reveling in "prosperity," so-called; the results of unwarranted profits in the manufacture of cheap shoes. Of course consumers were paying too high a price for these goods; and can that be called a true prosperity which cast a blight upon neighboring rural life? Neither the farmer's sons nor the new comer from country districts could be coaxed to remain upon the farm. The high wages induced extravagant living, resulting in corrupted morals and a large death rate among the young men. The population became unfitted for the hard conditions which speedily followed a readjustment of wages, often to one-third the former rate.

New England farming has suffered by the contrast presented by overpaid industries in other lines, rendering the farmer dissatisfied and robbing the farm of its most energetic blood in many cases. But I cannot see how making the farmer's conditions harder can minister to his good. The farmer's prosperity is true prosperity. The dollar he takes is a clean dollar, while the overpaid factory worker's wage both defrauded the buyer of poor goods and wrought his ruin through town vices. Enlarge the farmer's opportunity to create new wealth, and we have a prosperity which prospers both himself and others. The average farmer is living with his eyes closed as to his true status, both as to the intrinsic honesty of his true wealth-creating labor and the degree of prosperity which attends his work. His children will be respected, both on and off the farm, to a degree in wide contrast with the town dweller, the average course of whom is downward, not always morally, but at least physically. The hope of the nation is the farm's prosperity. How to conserve fertility is the ever-present problem. To haul manure is arduous, and its expense may counteract all gains. The forces of nature work without wages, and they will create fertility if properly directed. What seeds to plant in order to allow Nature to enrich the soil is apparently the most pertinent farm problem. Will the Cowhorn turnip prove to be the efficient renovator of barren soils? If not, some other plant will, and its discoverer become a public benefactor.

F. W. PROCTOR.

APPLYING PARIS-GREEN TO POTATOES.

Seemingly in our efforts to destroy Potato beetles we have tried everything within the range of poisons, together with a great variety of methods of applying them, varying from a dusting box to a spray pump. Last season we hit on a little device that proved singularly simple and very satisfactory on the whole. Two pieces of heavy coarse burlap cloth, each about two feet square, are used, the edges being gathered up in the hand, as is shown in Fig. 212. A piece of this burlap taken in each hand, and carried over each row of potatoes, will readily enable one to cover a small patch with plaster and Paris-green in a comparatively short time. Last season we used the prepared plaster and Paris-green, such as is sold commercially, with very satisfactory results. If one wish to prepare his own plaster, it can be readily done, and used just as satisfactorily as the commercial stuff. In using dry plaster it is commonly best to put on early in the morning, when the vines are damp with dew. It will thus stick better, and commonly proves more effectual in destroying the beetles. In case of rain directly after applying, I do not know that it will wash off any more readily than Paris-green applied in any other manner. We like to apply the poison just about the time the young are ready to put in their best work. Save in uncommon seasons we have succeeded in exterminating Potato bugs quite effectually at one plastering.

Shiawassee Co., Mich. C. P. REYNOLDS.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Raspberry Root Gall.

R., Degolia, Pa.—Can you tell me what is the matter with my red raspberries? They are not doing well, and have large lumps on the roots. Is there any cure? Give a full description of the disease if familiar.

ANS.—It is almost sure that root-gall is the disease which is preying upon the raspberry plants mentioned. It comes from spores which are in the soil where the berry bushes are grown. When the soil is so infested the roots are almost sure to become knotty from the galls which grow on them. There is no known remedy for the galls after they are once on the roots, except digging up and burning the bushes. No other raspberry bushes should be planted on the same ground until after several years of cultivation in other crops.

H. E. VAN DEMAN.

Driving Nails into Apple Trees.

G. L., Pittsfield, Mass.—Tell readers who are troubled with Apple tree-borers to drive a few nails in the trunk of their trees. If small trees use small nails. I discovered this several years ago, and have never published it in print. I cannot account for it, unless the rust of the nails in the sap of the tree does the business. It has worked with me in apple, cherry and plum. I discovered it by nailing a cleat on a cherry tree for my wife to put a board on for her plants. The tree was almost dead, but came to be a nice one.

ANS.—The plan of driving nails into fruit trees of various kinds, with the idea of preventing Pear blight, keeping off insects, and making them more productive, has long been tried by experimenters in a small way. There have been various statements made concerning the results of some most remarkable claims as to the efficiency of the work. Everything has a reason, and when we get down to the bottom of this particular matter we find that the rust from the nails has no chemical effect whatever upon the sap of the tree aside from that part next to it, nor does it either kill insects, such as the present correspondent supposes, destroy or prevent Pear blight, nor otherwise advantageously affect a tree or its fruit in any way, except that the injury to the tree does sometimes cause it to bear earlier or more abundantly than otherwise would be the case. Apple tree-borers are only kept out by putting some covering about the trunks near the ground, such as stiff paper, which prevents the laying of the eggs, and in the case of the cherry and the plum they do not have borers, so that the nails driven by our friend could not possibly have prevented them from getting in. There is undoubtedly some other reason for the borers not having attacked the apple trees mentioned. H. E. VAN DEMAN.

Chickens, Grass and Fruit.

J. R. F., Dayton, Tenn.—1. I would like to ask whether incubators are usually a success. What kind is best? Is it necessary to have brooders? Would one brooder be sufficient for 100 chicks hatched at once? 2. What are the best early apples and peaches for this climate? What is the best cherry for cooking? 3. The pasture I have for my cows is low land, and has become mostly wild grass. As the cattle do not like the wild grass, I have thought to put it in Blue grass. Does this thrive in low land? If so, what process will be best to get the wild grass killed and a stand of Blue grass?

ANS.—1. Yes, incubators are usually a success, I would not be without one if I expected to raise as few as 50 chickens. They are economical and very satisfactory, judging by the experience I have had with them, after bothering with sitting hens nearly all my life. There are many good incubators and very few poor ones. It is with incubators much as with sewing machines—their success lies largely with the operator. Brooders are necessary when the chicks are hatched without hens to care for them. Brooders are perhaps more difficult to manage than incubators, yet I have never had any serious trouble with them. One great benefit is that they do not give lice to the chicks as do nearly all hens. Brooders are made to hold from 50 to 500 or more chicks. A 400 size is the kind I have generally used, but the smaller sizes work just as well.

2. Among the best of the early apples are Red June, Summer Rose, Fanny, Primate, and a little later Jefferis. Of early peaches the Triumph, Sneed, Waddell and Dewey are all good. I would avoid all of the Amsden and Alexander type of peaches, because of their poor quality and proneness to rot. The best early cherry for cooking, that will succeed well in Tennessee, is Richmond, and for a late variety the English Morello, or the common Morello in case the former is not easily procured. 3. Redtop grass succeeds better on low land than most other kinds, and I think it more likely to last in the situation mentioned than Kentucky Blue grass. However, I have seen the latter doing well on moist lands in many places. The way I would proceed to reset to either of these grasses is to plow and cultivate the land for one year, and then seed in the ordinary way. I would sow about 10 pounds of each kind, and let them fight for the supremacy.

H. E. VAN DEMAN.

Using Paris-Green on Potatoes.

H. C., Connecticut.—What can you say about the best method of applying Paris-green for the Potato bug? If applied mixed with water, will it burn the foliage more than if applied dry?

S., Hilton, N. Y.—Will you tell me how to spray potatoes, and what mixture to use for bugs and blight?

ANS.—We use water spraying by means of the Eclipse pump and a set of nozzles which cover three rows at a time. This does rapid work and kills the beetles. The objection is that in showery weather the spray is easily washed off. It is hard to hit every hill or plant with any horse-power machine. We have used the Paris-green gun with pure Paris-green or with the poison mixed with flour or plaster. This work is rapid and accurate, as the gun enables one to put the green where it is wanted. The pure "green" is easily washed off by a shower, and it cannot be properly placed when the wind is blowing. The best time to use it is in the morning, when the vines are wet with dew. The dry mixtures of Paris-green in flour or plaster are most expensive and slowest to apply, but they stick better and give excellent results. With us the water mixture does not burn the vines seriously, but the "best" way for one would not be best for another.

How Much Growth for a Tree?

W. H. D., Midland, Mich.—We frequently see, both in farm papers and experiment station bulletins, a statement that organic and nitrogenous manure should not be used on fruit trees that are making a satisfactory growth, but that if the growth is not satisfactory some form of nitrogenous fertilizer should be used. Nowhere have I seen a statement of what is considered to be a proper annual growth, except in a book that was published over 50 years ago. My Japan plums made a growth of about four feet besides the laterals the year they were set out, and the year following Northern Spy apple trees made a growth of two to three feet, the Canada Red and some other slow growers did not grow more than one foot. Do these growths indicate an excess of nitrogen or a lack of it? All the trees have had all the wood ashes that it was safe to apply. How should the growth of a tree after it begins to bear compare with the growth prior to that time?

ANS.—There is a possibility of getting too much growth on fruit trees in cases where nitrogenous manures are freely used, whether they be organic or inorganic, but there is much oftener too little than too much of it used. The effect of nitrogen is to make a rapid growth of the plant or tree and to increase the size and prolong the season of growth of the fruit. But it also makes the fruit softer and more watery than is normal, and sometimes injures the flavor. I have also known an excess of nitrogen to cause the fruit to drop in its earlier stages. When a fruit tree is young it should grow much faster than when at bearing age. From three to six feet on some of the branches is none too much for the first five or six years of almost any fruit tree, but a part of this should nearly always be cut back annually in order to give proper form to the tree. In the case of the peach this pruning back is very essential, that there may be plenty of new bearing wood constantly on the tree. It is not so important with the plum, pear and apple. An apple tree that is not making an average of one foot on the terminal branches evidently needs stimulation. Good tillage and perhaps manures should be applied at once. Wood ashes make one of the very best of manures for orchards. I would think that apple trees making two or three feet of growth are not needing more nitrogen. H. E. VAN DEMAN.

Wood Acids in a Chimney.

A. N. B., Marshfield, Vt.—Who can tell us how to fix a chimney so that we shall not be troubled with creosote? Our chimneys come together in the attic, only one going out. One bricklayer tells us that the slant is the cause of the trouble, but a neighbor has a chimney which goes straight up, and he is troubled the same as we are. We must lay over our chimneys this Summer, and we are anxious to prevent the trouble if possible.

ANS.—Wood consists of some combustible matter which is filled with cells or spaces in which water is held. The sap of wood is simply this water, having organic matter of which the new growth of wood is made dissolved in it, and the sap passes from cell to cell from the roots until it reaches the top twig of the tree. Green wood, freshly cut, has more than half of its weight of water in it, and when it is well seasoned, and as we call it "dry," it still has one-sixth of its weight of water, so that when wood is burned this water is changed into steam, which goes off with the smoke into the chimney. Wood also contains a special acid known as pyroligneous, or burned-wood acid. This consists of some of the carbohydrates of the wood in solution in water. The fact is, that to a certain extent, in burning, the wood is distilled; and the smoke, with considerable steam and other vapor, in a condition of intense heat, goes up into the cold chimney. These are the facts as regards the wood. Now all vapors are condensed by cold, and changed to liquids. So the heated air going up into the cool chimney is cooled, and the vapors and gases in it are condensed. The pyroligneous acid, especially, is condensed, and along with the water in the vapor is deposited with some of the unconsumed but burned woody matter on the walls of the chimney or stove pipe, and, of course, this liquid matter—black and acrid in odor—must run down and find some way of escape, which is generally to the bottom of the chimney, where it flows out and makes trouble. Or it will escape through the joints of the stove pipe, and run down dropping to the floor, and causing trou-

New York State Fair

SYRACUSE

September 9 to 14, 1901

$65,000 in Premiums and Purses $65,000

It will be the LARGEST LIVE-STOCK EXHIBIT ever held in the State.

Entries in the Cattle, Sheep and Swine Departments are being received from all parts of the United States and Canada.

The Short-Horn Breeders' Association of America will duplicate the premiums offered in the Short-Horn class, making that class worth $1,085.

The Cattle, Sheep and Swine exhibited at the Pan-American will be shown at the State Fair.

An Auction Sale of Cattle will be held under the auspices of the Commission on Friday, September 13.

Entries in the Live Stock Department close August 10.

The Fastest Horses in Ameriea will compete in the races.

THE GRAND HORSE SHOW

will bring the best Thoroughbreds, Trotters, Hackneys and Coachers together that has ever been seen on the Fair Grounds. Everything in first-class condition.

GENERAL ADMISSION, 25 CENTS

Send for Premium List. S. C. SHAVER, Secretary, Albany, N. Y.

bic and indignation to the housekeeper, who is apt to blame the innocent builder of the chimney unjustly. All this being thus, what is to bc done about it? It is evident that the short straight chimney affording the easiest and quickest outlet for the smoke and hot air, with the contents of both, will be the least troubled by this deposit or condensation on the inside of the chimney, and that a bending flue, by arresting the passage of the hot air with these vapors, will be subject to most of this trouble. But the difference will be very little except in long chimneys. What is the remedy? This is simply to burn only dry wood; to have the chimney so made as to afford the strongest possible draft; a straight one is plainly the best; and if it is impossible to stop the current of this pyroligneous acid and water, have a receptacle made in the inside of the chimney like a trough, to catch it as it runs down the inside, and dispose of the accumulation at convenient intervals. There is very little if any trouble with dry wood, and to have it so it should be cut in good season and well dried before the Winter.

H. STEWART.

Diseased Lilac.

A. F., Troy, N. Y.—Will you tell me what to do with a diseased lilac bush? This Spring was the first it blossomed; now the main trunk of the little tree exudes gum, and the trunk seems split open. One of the branches seems dead. What is the trouble and what the cure?

ANS.—The lilac has few diseases, and it is not easy to assign a cause for the trouble without an examination of the diseased part. The best treatment would seem to be to cut away all dead branches and scrape out the split portion, dressing it with shellac, varnish or some quick-drying paint to keep out moisture until healing takes place. If the plant does not show signs of recovery by next year it should be rooted out.

Raising Basswood from Seed.

F. A. P., Dudley, Mass.—Give the best method of saving and planting seeds of basswood, caring for and transplanting young trees.

ANS.—Basswood or linden seeds are generally stratified in moist sand as soon as gathered, and kept until the following Spring. The box containing the seeds and sand may be kept in a moist cellar or buried a foot below ground in order that they may not dry out. The seeds and sand should be put in in alternate layers of an inch or more in depth. When the ground is fit to work next Spring the seeds should be thinly sown in drills, covering a scant half-inch in depth. The drills may be 20 inches apart if hand cultivation is used, or three feet for horse tools. Pack the soil well above the seeds with a board, or by treading on the row. When the seedlings come up they may be thinned to four or five inches apart, and kept well cultivated and free from weeds during the growing season. At the end of the second year they may be transplanted eight inches to a foot apart in similar rows. Basswoods are also grown from cuttings of soft or new wood, also from layers. Named kinds are grafted on stock grown from seeds of ordinary varieties.

Cure for Peach Curl.

Reader.—I see reference made to the fact that some peach growers in western New York will have good crops in spite of the "curl" disease. How do they account for this?

ANS.—With the cold, wet weather of last Spring it was absolutely necessary to spray and spray early in order to check the curl leaf. I never sprayed so thoroughly as last Spring. Everything was blue, the trees, the ground, the men, the horses, and the sky. Many laughed because I sprayed, as they said, in the Winter, but my advice would be to spray the first warm day in early Spring. I left 18 trees of Elberta without spraying, just to experiment, and every leaf curled and dropped, while the trees by the side of them that were sprayed are healthy and in fine condition. I think I get the best results by using six pounds of vitriol and eight pounds of lime to 50 gallons of water. In this section there are but three orchards besides mine with a prospect of a large crop, and the owners, like myself, attribute their success to early spraying. JAY E. ALLIS.

Orleans Co., N. Y.

An Apple Orchard on Rock.

J. M'C., Salem, N. Y.—I intend to begin to set out an apple orchard for commercial purposes. Will you tell me what Winter varieties you would prefer for this section? They will be on dry slaty soil with rock close to the top of ground. Is there any objection to starting the trees from seed where they are to remain? If not, what variety of apple would it be better to use for seed, and at what age should they be grafted?

ANS.—We all know that it is possible to grow to maturity healthy trees on just such land, but whether it is possible to raise an even, healthy and satisfactory orchard on such a location, is another question. If the rock is of a hard, flinty kind, and shows little sign of the weathering influences which we like to see, and besides this crops up unpleasantly near the surface, I would not advise using it as an orchard site. On the other hand, if loose and shaly (rotten stone, so-called) and I wanted an orchard badly, and had a market for the fruits, then I should plant it. The ground ought to be thoroughly torn up previous to planting. It ought to be cropped with something which would leave it in a mellow condition. Good big holes, not niggardly pockets, should be provided for each tree. If the holes cannot be made big enough with a shovel and pick, then blast them out. The point is that after trees become established on a site like this, they usually get along well. There is unquestionably quite a large amount of unaccounted-for plant food and moisture in these rocky soils. Then, what about varieties? I would not plant on land of this kind varieties that take half a generation to come into bearing. It is probable that you would not be able to give it the best cultivation. It is altogether likely that borers would take advantage of the situation, and the general outlook would be that trees would, more or less, have to get along themselves. With this thought in mind, I would plant hardy, early-bearing sorts. I should plant Wealthy because it bears well, is a vigorous grower, and is very productive. It is a Fall apple. I would plant Ontario for the same reasons; this is a Winter apple. I would also plant Ben Davis and Fameuse. I do not think I would set out Spy, Baldwin or Greening.

There is no objection to starting an orchard from seed, if one can do it, but the thing is almost practically impossible. I feel quite sure that if a man did get an orchard in this way, he would have vigorous, healthy trees, and probably the foundation of a long-lived, productive orchard. But the difficulties in the case are that a seedling apple is a tender thing, and a small plant the first year. Unless carefully tended during this period, it is likely to get "knocked out." The same thing is true of the bud or graft which is inserted or ought to be set in the seedling at the collar the second year. These young and tender things, needing special care, can best be looked after in the nursery. Here is where intensive cultivation can be given and a vigorous frame produced in a short time. I believe in a general way that these rocky lands can be utilized for fruit-growing purposes if the grower uses intelligence and judgment in planting and caring for his trees. Clover could be grown, cut and used as a mulch in lieu of cover crops and manure. Wood ashes could probably be secured in Washington County, and these could be used to supplement the nitrogen of the clover. I know of a large orchard enterprise which has been started in southwestern Quebec, not very far from the New York line, on land similar to that described above. The trees were planted five years ago, and are doing remarkably well, but they have had good care. JOHN CRAIG.

Ithaca, N. Y.

The Soap Fraud Once More.

G. S. B., Mays Mill, N. Y.—I inclose a wrapper from a bar of soap sold by an agent who has been through this town. He has samples of carpets, lace curtains and sets of dishes offered as premiums. His way was to sell a box of 100 cakes of soap for $5, promising that another agent would follow in two or three days with the premiums, but he never came. The soap is the most worthless you ever saw.

ANS.—The wrapper is a dirty, poorly printed sheet describing "Gold Medal" soap. We consider it surprising if any reader of THE R. N.-Y. has been fooled by this common fraud. We have described it again and again. The soap is usually worthless, if not injurious to clothing, and the rascals who sell it have no idea of giving carpets, curtains or any other premiums with it. They are simply after the $5, and we regret to say that they often get the money. Why farmers who are shrewd enough in dealing with friends or neighbors will permit such slick-tongued rogues to get their money away from them is one of the great mysteries of farming.

The "Deserted Farms" of New England.

E. L., Leeds, N. D.—I have read in the papers several times about deserted farms in the East, and wondered whether a farm could support an industrious family. Our boys have longed for a farm since they were babies, and so have I, but the hard Winters and the naked prairie have kept us in town. If we could get a farm where nature was more generous in beauty, I would gladly change home.

ANS.—Most of the so-called "deserted" farms are in New England. It is possible for an industrious family to make a living on such a farm, but fair capital will be required, and the members of the family must possess the ability to be satisfied with country life. These farms were "deserted" for various reasons. In most cases the old folks found it impossible to carry on the business of farming—the boys and girls having moved away. Some of the desertions date back to the Civil War, when the boys went away to serve as soldiers. They were killed at the front or moved West or South after the War, leaving the old folks alone. The soil of these farms is usually strong, but very stony. The old pastures and many former meadows have grown up with brush or small trees, and would have to be cleared once more. The buildings are usually in fair condition. The roads are fair. A few years ago some of the New England States started to advertise and sell these farms, and they succeeded so well that few are now left. Write to the following parties for information: Hon. J. W. Stockwell, Boston, Mass.; N. J. Batchelder, Concord, N. H.; Dr. G. M. Twitchell, Augusta, Me.; James F. Brown, Stonington, Conn.

Send for sample and prices. I am not a dealer, but offer only choice seed of my own growing. R. H. VAN DYKE, Dover, Del.

PEDIGREE CRIMSON CLOVER SEED.

Eight successful years in succession. Only 60 miles south of Cleveland, Ohio. Try it. Price, $6 per bu.; $1 80 per peck. Sacks, 8c. per bushel. A HURSH, Burton City, Wayne Co., Ohio.

1901 CROP CRIMSON CLOVER SEED.

Ready now. Pedigree seed of my own growing Clean and pure. Send stamp for sample and price when ready to buy. E. G. PACKARD, Seedsman, Dover, Del.

CRIMSON CLOVER In sowing this valuable clover it is important that American seed is used. We supply genuine Delaware seed only. Our special circular describing uses of Crimson Clover is mailed free. **HENRY A. DREER, 714 Chestnut St., Philadelphia, Pa.**

The New Horticulture

BY H. M. STRINGFELLOW.

We do not hesitate to say that this is one of the most interesting books on horticulture that ever was printed. Most reading farmers have heard of the now famous "Stringfellow Method" of planting trees, but few understand clearly what it is. This book tells the whole story in clear-cut, forcible style, which all can understand. Not only is the theory of close root-pruning carefully explained, but the general principles of gardening and fruit-growing are discussed. Mr. Stringfellow is a practical gardener, and he gives his own experience. We commend the book to all without reserve. New Edition, paper covers, 50 cents.

THE RURAL NEW-YORKER, New York.

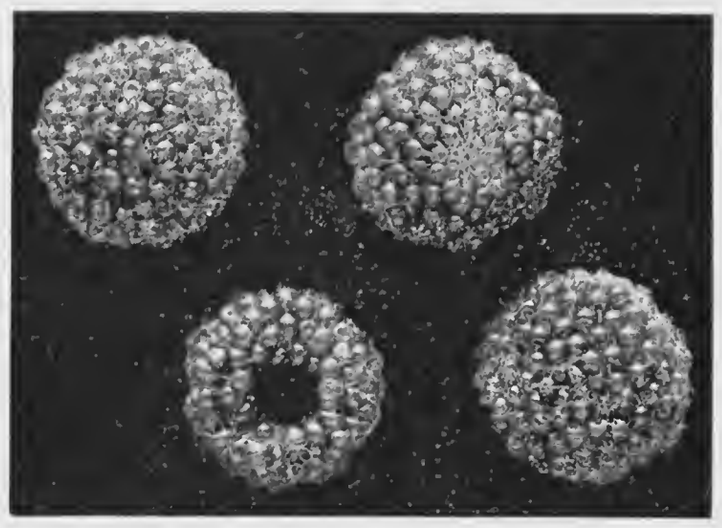
Ruralisms

NOTES FROM THE RURAL GROUNDS.

CHICKENS AND TOBACCO.—Observant readers of this column may have noted a lack of comment on the progress of the greenhouse chickens mentioned on page 212. It is not agreeable to record failure where success should be confidently expected, but an examination into the conditions will usually reveal an error or omission accounting for the lack of success. Those chickens failed to thrive after the first week. Their appetites grew less, until the daintiest food was regarded with aversion, the growth was checked, the skin became dry and harsh, and the feathers staring. They seemed to be feverish, and developed an insatiable thirst. There was generally an idiotic appearance, if such may be attributed to a chick, while the usual apathetic lassitude was varied by sudden aimless starts. A general paralysis soon followed, and deaths began to occur. As the care and conditions of temperature seemed quite ideal the case appeared rather puzzling until the similarity of the symptoms to nicotine poisoning in young victims of the cigarette habit was noted. The benches of the greenhouse were crowded with tender plants, and the dull weather had favored the extension of green-fly or aphids so that repeated night fumigations of tobacco stems were needed to hold the pests in check. While the chickens were always carefully removed during a fumigation, and not replaced as long as there was a visible trace of smoke, enough nicotine saturated the soil and air seriously to injure the chicks and keep them in a state of semi-intoxication. As soon as provision could be made elsewhere they were removed, and quickly recovered appetites and interest in life. With the exception of those manifestly too far gone before removal, all made good recoveries, but they remain stunted in growth. All who have closely noted the appearance of a youth addicted to tobacco will recognize the portrait. It has been well settled by medical authorities that tobacco is always injurious to young and undeveloped animals, human or otherwise, though it may be either indifferent or beneficial in a slight degree to the adult. The mother hens were not visibly affected in this case, though the nervous system of the chicks was disordered to the verge of paralysis. Tobacco in any form is a filthy thing, and it would be well if its consumption could be confined to its legitimate use as an insecticide. We shall try hydrocyanic gas next Winter. Its use is attended with some danger and inconvenience, but at any rate the lingering and disagreeable odor of tobacco may be avoided. During the Spring of 1900 there was less necessity for fumigation, and the broods of chickens under the benches got on splendidly, with no loss.

BUSH FRUIT PROSPECTS.—The various bush fruits bloomed well, and generally set a good crop, though the early species, such as currants, gooseberries and Elæagnus were adversely affected by the frequent rains at the flowering period. The fierce heat wave now on at this writing, July 3, has hurried the ripening of blackcap raspberries, and badly scalded exposed gooseberries. The Triumph gooseberry bush mentioned on page 498, 1900, yielded eight quarts of large and perfect berries. It has been planted four years, and is just getting into good bearing condition. Blackberries, red raspberries and dewberries all show great promise, but their ultimate performance greatly depends on the amount of rain they will get before ripening. Strawberries were sharply cut by the heat, the berries scalding in a wholesale manner. The local markets are already bare of this popular fruit, making, together with the late beginning, one of the shortest seasons on record. Jesse B. Rogers, the veteran Jersey horticulturist, who has excellent sources of information, estimates the strawberry crop of the State at a 40-per-cent yield, sold at a 60-per-cent price, which is far from a cheerful condition. In our local market fair prices for good berries were obtained all through the season, but berries of this character were scarce.

THE GOLDEN MAYBERRY.—This interesting offshoot from the Chinese Rubus cratægifolius is again bearing a moderate crop. It wintered with but little loss of wood, and bloomed profusely, but the rains evidently hindered pollination. It ripens here during strawberry time, and is naturally later this year than last from the low temperature range of the Spring months. The berries are large and handsome, bright clear yellow in color, with a sweet and sprightly flavor. The seeds are very small. Fig. 213 shows some good specimens from our plants, taken natural size. There is no doubt of the desirability of this berry if it could be grown in sufficient quantity, but as we have only known the plants to fruit twice in seven years it can be imagined they are of no practical value where Winter temperatures approaching zero may be expected. The Mayberry ought to be thoroughly tested in the South, where it may prove really useful. Prof. George B. Groff stated in a paper read at the last meeting of the Pennsylvania State Horticultural Association, that the Mayberry is the only bush fruit he heard of in a two years' residence in Porto Rico. It had been introduced locally soon after its dissemination in 1894, and was spreading with some rapidity out of the bounds of cultivation. The Porto Ricans prize it highly, and find a ready market for all the berries that can be had. It is possible that several other tender Oriental species of Rubus may prove desirable in this tropical Island, as our northern berries do not thrive under such conditions of uniform high temperature. W. V. F.



THE GOLDEN MAYBERRY. FIG. 213.

Starting and Growing Rose Cuttings.

When shall I cut and how start and care for rose cuttings? When is best time to put limbs of roses down to root to get layer plants? J. F. D.

Denmark, N. C.

Very few roses root well from cuttings made from wood grown in the open air. The everblooming varieties included in the Tea, Bourbon and China classes are most easily propagated in this way. The cuttings should be made from branches that have lately bloomed, or still in flower, and may have two or more buds or "eyes." They should be cut smoothly with a sharp knife, about half of the foliage trimmed off, and immediately inserted in wet sand. The sand should be very firmly packed and freshly watered. The hole for the cutting may be made with a small stick, the cutting inserted, leaving but one bud and leaf out, and the sand packed with the same tool. The propagating tray or bench should preferably be under glass, where it can be partially shaded and protected from drafts. The cuttings should be frequently sprayed on bright days, and the sand kept constantly moist. If all goes well the cuttings will begin to throw out roots in about six weeks, when they must be potted off singly, using pots not more than 2½ inches in diameter. Cuttings from wood grown under glass always succeed best under similar conditions. Rose branches may be pegged down to form layers at any time in Summer, but July and August are probably the best months, while branches are still growing.

Manuring Asparagus in the Fall.

The asparagus crop has been a short one in this section this Spring. I have a plantation that has not produced very heavily. How would it do to apply a good dressing of stable manure when the cutting season is over, and cultivate it in during the Summer? Would it not result in stronger shoots next year? Do you think excessive manuring might tend to increase the rust on the plants? H. C. C. M.

Milford, Conn.

It is usual to fertilize asparagus in late Winter or early Spring, spreading the manure and cultivating it in as soon as the soil may be safely worked, but on the principle of better late than never it will do immense good to fertilize immediately after cutting. Asparagus roots deeply, and it requires considerable rain to wash the soluble constituents of manure deep enough to be available, so that a late fertilization may not be as effective the first growing season as an early one, though some surplus may remain until the following year.

LONG ISLAND NOTE.—The Pea louse arrived here about the end of June this year, and the intensely hot weather further hindered its breeding work, so it did not do any harm. The best pea for quick maturing, good crop and healthy growth was the Excelsior. It matured 10 days earlier than the long-vine peas sown the same day. The weather from about the middle of June till July 2 was dry and intensely hot around here. Potatoes will feel it most, although small carrots and late beets were injured. Since the rains large areas are being planted with cabbage. Fields of tomatoes set out "on water" during the hot spell died. All about here there were dozens of people planting still on the Fourth. Early corn is looking well and promises a good crop. The only grain grown about here is a piece of rye for bedding. Some sow millet after early peas. Corn and stalks are the chief home-produced horse feed. A. C.

Nassau Co., N. Y.

SOME "CLARK" GRASS.—I went to see George M. Clark's grass field last week and was rather disappointed in not finding 16 acres of grass instead of about five or six. The grass that was across the brook on the north side of the field was very fine; in fact, it all looked well. I had a long talk with Mr. Clark in regard to his grass, and have come to the conclusion that the average farmer cannot raise as much grass as he can, and have my doubts as to whether it pays with fertilizers at $40 per ton. I tried his treatment last Fall on four acres with his kind of tools, and followed out directions as nearly as I could; bought the same kind of fertilizer as he uses, and my grass is about one-half as tall and as thick on the ground as his was. I looked at mine one day and his the next, and in one corner of the lot I sowed Canada wood ashes, and it looks much better where the ashes were sown than where soda, potash and bone were used. If anyone can tell why that is so I should be glad to know

Carmel, N. Y. T. F. K.

R. N.-Y.—The only guess we can make is that your soil needs lime. The ashes contain about one-third lime, and we do not see what else could make the difference.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

EVAPORATOR "The Granger" for fruits and vegetables. $3, $5, $8. Circular EASTERN MFG. CO., 257 South 5th St., Phila., Pa.

SHAFT HOLDER and ANTI-RATTLER. Patented. Keep shafts in upright position when not in use; no weight on horse's back; prevents rattling; only 6 inches long; can be put on by anyone in 10 minutes; warranted; $1.25 per pair, charges prepaid. Territory for sale Big inducements to Agents & Dealers Mention this paper when writing. Queen City Shaft Support Co., HARTWELL, OHIO.

How to Drain Land Profitably. On every farm there is probably some land that could be made more productive by underdrainage. Properly drained land can always be worked earlier, and more profitably. The ROUND TILE best and most economical way to drain is explained in the book, "Benefits of Drainage and How to Drain," which is sent *free* by JOHN H. JACKSON, 76 Third Avenue, Albany, N. Y.

BALES 15 Tons a Day HAY

The Gem Full-Circle Baler, lightest, strongest, cheapest baler. Made of wrought steel Operated by 1 or 2 horses. Bales 10 to 15 tons a day. Sold on 5 days trial. Catalogue free. Address GEO. ERTEL CO., Quincy, Ill.

OUR "HANDY MAN" GASOLINE ENGINE works a walking beam pump jack, grinds, shells, cuts feed, separates cream, churns, cuts bone, etc. Easy to disconnect and put on belt. Engine 1½ actual h. p. Easy to learn, easy to operate, most economical. Gasoline supply tank. Engine and all, on one base. Send for our Illustrated catalog. WEBSTER MANUFACTURING CO. 1097 W. 15th St., Chicago, Ill. N. Y. office 38 Dey St., N. Y. City.

SLUG SHOT Kills Cabbage and Other Worms in the garden safely and cheaply. SOLD BY SEED DEALERS. For Pamphlet address B. Hammond, Fishkill-on-Hudson, New York.

Hope Farm Notes

FARM NOTES.—The first early cabbage was ready to cut June 26. As I have stated before, these cabbage plants were started outdoors in Florida on January 20. They were never covered, but were transplanted twice and shipped to us by express late in April. They were thick and stocky plants, and in a better season would have been much earlier. This cold and wet Spring has held everything back. I do not think it will pay to bring the plants from the South. The express cost is heavy, and will eat up a good share of the proceeds. The early cabbage crop with us is not usually profitable, as there is too much competition from the South. The late cabbage crop pays better, especially when it can be stored and kept well. One thing, however, is sure. This early cabbage is "as tender as a chicken." For some reason which we cannot explain our "Clark" grass fields turn out to be 70 per cent Red-top. The Timothy is very thin, yet we are sure that we put in the full quantity of Timothy seed. As they stand, these fields are quite disappointing. The Timothy may come in later, and I try to be hopeful and believe that the second crop will be heavier. It tries a fellow's philosophy, though, when your neighbor, under the old plan of plow and harrow once, sends you to grass by getting twice the yield. . . . I begin to get a little nervous about hay and fodder since the first cutting of that "Clark" grass has turned out so poorly. Our corn was planted late, and is still short, though it will come on. We must have more fodder corn in as soon as possible. I shall also try to get an acre or so of Early Amber cane in after the rye. All such fodder run through our shredder will make fine horsefeed. . . . . On July 6 we plowed a strip from which Crimson clover had been cut and broadcast Thoroughbred flint corn—covering with the Acme. It is a new thing for me to practice such broadcast seeding, and I will not advocate it for others. What with the rain and the heat we are behind, and must jump things in and let them care for themselves as much as possible.

HOT WEATHER.—The great "hot wave" of June and July, 1901, will long be remembered. It began on Saturday, and grew worse and worse with each hour. It was bad enough out here among the hills, but in the city the heat was fearful. Sunday was a scorcher. The fierce sun beat down on the hills and baked them into solid bricks. How our folks did bless the good old Dutchmen who, years ago, planted the great cherry trees in front of our house. These big fellows held out their green arms, and as the breeze blew through them, boxed with the sun and warded off its fiercest rays. The big orchard near the house also showed great cooling depths of shade. The trees are great, ungainly things, of varieties long out of date. They are too close together, with great spool grafts and twisted trunks. Yet with all their defects, we love them for their shade if for nothing else. They made life endurable during that fearful scourge of heat. The air was cooled beneath them, and then crawled down the hill past the house, keeping up a perfect little breeze. The heat rays struck our hillside like strokes from a sword, and man and beast were driven panting to the shade after a few hours of it. Monday and Tuesday were hotter yet, but on Wednesday a heavy shower cooled off the air.

THE GLORIOUS FOURTH dawned bright and smiling. We are Americans at Hope Farm, and independent enough to declare our principles when the time comes. Our folks have not yet declared their independence of the flesh pots of Egypt, and so Aunt Jennie's first proposition was "What about dinner?" Hugh and Charlie had killed and dressed a little pig. He was too big to crowd whole into the oven, so Charlie was appointed a committee of one to barbecue him. A big hole was dug out back of the shed, and shortly after breakfast a roaring fire was started in it. When this fire burned down to coals irons were put across the hole and piggy (sliced in two) was put on them. He soon began to sizzle and brown in a way to make your mouth water. Charlie turned him from time to time and kept him moist with vinegar and butter. It was necessary to build a new fire and put more coals under piggy, but after about three nours he was roasted in every scrap of his little body from snout to tail-tip. In addition to piggy, Hope Farm was able to furnish peas, lettuce, cabbage, turnips, beet greens, new potatoes, cherries, raspberries, eggs, chicken, onions and currants, but we were content with peas and potatoes. The women folks set a table outdoors under the great grapevine, and the whole 15 of us sat down and sampled Charlie's fireworks with full hearts and stomachs. We concluded that this country is a goodly place to live and work in. We feel grateful to the hard-headed old patriots who hung out for their rights and thus hung up the flag and gave us a country.

SENTIMENT AND BUSINESS.—Our country was lively territory during the Revolution. Washington's army camped for several days within three miles of our place, and all through the War this region was a fighting ground. The stone part of our house was built then, I think, but I am not able to say which room was occupied by Washington! We have a 10-pound cannon shot which was dug out of my neighbor's farm, and bullets have been frequently found. The Dutch farmers of that time were thrifty folks, and they didn't purpose to let a redcoat get the benefit of their rye and hay if a bullet would stop him! I looked at my cannon shot on July 4 and realized that this dull and rusty iron is of very little use now except to call up a sentiment. It was energy, moral force and hard-headed character that painted blue and white stripes over the red coat. We had about a ton of hay down, and an order for a crate of cherries. These goods couldn't be delivered by delivering a Fourth of July oration, so we left the rusty iron ball and went out into the sun to finish our work. That dinner didn't leave much in the stomach except a chance for repairs, so we made a light supper of bread and cheese and milk. There were a few fireworks to let off in the evening, and after the last skyrocket faded out the Hope Farmers "turned in" without a burn or a bruise, to rest for the duties of another day.

A WORLD BEATER.—Nellie Bly gave us a surprise the day before the Fourth. There was a baby horse trotting about the barnyard—a perfect picture of her mother. Every Hope Farmer except the Madame made a run for the barnyard before tasting breakfast. Charlie claims that it is a fine colt. I have never raised a colt before, and don't know what a fine one should look like, but this one seems to me all legs. I can understand that legs are necessary in order to hand down a legacy of speed, but my judgment would be that Nature has overdone the business in this case. The father of this colt is Alcyoner. He has trotted a trial mile in 2:15, and has brothers who have done their mile in 2:08. Nellie Bly is lively on her feet, and this youngster ought to be able to go for the doctor when part of a minute means the difference between life or death! Perhaps we have the coming record breaker in this colt! "But what do you want such a colt for?" says the Madame. "What good will it do? It seems like a good thing to raise a strong, faithful farm horse like old Frank, for he will do his share of the world's work—but of what use in the world's economy is a high-strung nervous trotter?" I fear the Madame is not much of a "sport." After all, there is sense in what she says, yet thousands of people have an honest desire for a horse that can "go." The "go" and nerve give greater value to a pound of horseflesh than the stout muscles and heavy bones of the worker. I am raising horseflesh to sell. Nellie and her colt market part of our hay and grain. Nellie is a worker and her daughter will be able to do something besides trot a fast milc. The colt is for sale. Its name is Maria. I wanted to name it after the Madame, but she turned the honor over to her mother.

ODD MENTION.—After celebrating the Glorious Fourth we were ready for business. Friday looked like the beginning of clear weather, and so Charlie began to cut hay. By noon the clouds began to gather in the west, and our hay weather certainly went to thundering. What a storm it was! The rain fell in floods. Saturday kept it up. Our hay and many acres more on nearby farms was well soaked. Ought to have cut it earlier—you say. Perhaps, yet our season is at least 10 days late for everything except strawberries. . . . The cherries on one large and one small tree sold for $10.58. Two other big trees had at least $15 worth of cherries on them when this thunderstorm came. In 48 hours rot had nearly finished them. I never saw $15 go quite so rapidly, and I have spent some money foolishly, too. Score another point against cherry culture. In spite of all the "rot" which nature writes about it I shall keep planting cherry trees. . . . Among the communications received lately is the following advertisement:

"Wanted, a steady man to look after a garden and milk a cow who has a good voice and is accustomed to sing in the choir."

I will say right off that I could not fill the bill. I should probably ruin the choir. H. W. C.

Some Household Notes.

SORGHUM.—I tried this last year, sown in rows about 30 inches apart, and let it grow like fodder corn. It grew to be from five to 11 feet high. Cattle and pigs were very fond of it, even the poultry would eat the pith greedily. Of course, it was frozen in Winter and became sour. If one could take it to a mill and get from it sap as we get cider from apples, we might have a cheap, pure, domestic syrup. This, I am told, is done in some of the Middle and Southern States.

[R. N.-Y.—Yes, this is a regular practice in some localities.]

A SUGGESTION.—In our family we are very fond of mushes made from the various grains. Oatmeal of different kinds we can get, and generally good cornmeal and hominy, etc., but in this country of wheat production we could not get good cracked wheat. The boasted Pettijohn's is never fresh when we get it, and costs 15 cents for two pounds. As a trial I sent to the flour mill for some clean wheat, and put it through the coffee mill—now used only for this purpose—twice or thrice according to taste. This meal cooked in boiling water 20 minutes, then set back to simmer for half an hour with an occasional stir, makes, with good milk or cream, one of the most delicious dishes which come to our table—and costs three cents for two pounds. There is both benefit to the buyer and money to the seller in grinding grain fresh as coffee is ground in the store. Here is a chance for an invention. A. C.

Nassau Co., N. Y.

SEEDING GRASS ALONE.—I have for a few years past been trying a modified form of Mr. Clark's method of grass culture with good success. I have no Cutaway harrow, but use ordinary farm implements such as plow, roller, spike-tooth and Acme harrow, fitting the ground as I would for any other crop, using from five to six quarts of seed per acre, and from 100 to 200 pounds of good fertilizer. I tried four pieces on different parts of my farm last Fall, all of which cut very heavy grass, some of which was too thick. I have had very indifferent success when seeding with wheat and rye, but have never failed when sowing grass seed alone. J. T. B.

Plainville, N. J.

SATURDAY, JULY 20, 1901.

THE secretary of the Five States Milk Producers' Association announces that the annual meeting will be held at Binghamton, N. Y., Tuesday, August 20, 1901. The object of meeting in August instead of October is to give the Association an opportunity to develop plans for better Fall work. The local sections are to meet August 6, and the route unions August 13.

*

THE Agricultural Department now has the power to examine and certify dairy products exported from this country. Of course anyone can export such goods without certification, but it is thought that the Government stamp or label will be an advantage. It ought to be. The Department has spent a good deal of money in learning what foreigners want in cheese and butter, and how they want it packed. Its label on the package ought to mean something—and it will.

*

NOT long ago we received a package of strawberry plants and a box containing insects from a reader. He said he had caught the bugs eating the plants, and he wanted to know right away what to do in order to kill the rascals. The insects turned out to be the common sow bug, while the plants had been injured by the white grub. Our friend saw the bugs running about the plants, and concluded that they had done the damage. It is not uncommon for men to be sure of the effect and then guess at the cause. Thus they get off the track in hunting for a remedy.

*

WE understand that dealers are still trying to tell eastern apple growers that the western apple crop is "large." We have secured what we believe to be the most reliable reports yet printed. These indicate a light crop in the sections which usually send a large surplus to the East. It now seems settled that the eastern crop will be short, and we certainly hope that growers will not give their crop away this year as some of them did last. Bear in mind another thing. The total amount of apples in sight is not the important factor. There were plenty of apples last year in some parts of the West, but they were not good enough to ship! It is the barrel of apples good enough to go away from home and make a living that affects the market!

*

S. W. ALLERTON, the author of the article discussed on the first page, makes this statement:

No man is entitled to a serious hearing on the subject of farming unless he proves his faith by his works. "Do you run a farm yourself and do you make it pay?" are the questions to be put to every man who has any advice to offer about farming. If he can't answer yes to both these questions his talk is mere theory and not worth listening to. If theorizing would raise crops we should have to go to college class-rooms instead of to the fields for grain on which to feed the world; but it won't, and there is no use in giving serious attention to any talk on this subject that is not backed up by sound results, of a broad, practical sort, which have been personally obtained by the man making the suggestions.

That is a little hard on our scientific friends, and it would bar out some of the most prolific farm writers in the country. Certainly, we believe that no man should attempt to describe practical farm matters unless he be, in some way, connected with the actual management and ownership of a farm. We also believe that the soundest agricultural advisers are those who make the farm pay. We would not limit the "pay" part of it to a matter of dollars and cents. Some of the most useful and truest things that ever came off the American farm could not be measured by silver and gold. We can conceive of a hard-working careful man so conducting his farm as to earn but a bare competence, and yet producing upon it the noblest crop for God and humanity. It may be questioned whether the small freeholder will get as much real good out of Mr. Allerton's experience as he would from the advice and suggestion of men who are "nearer his size." Few Americans will ever be called upon to manage 80,000 acres of farm land from a city office. We hope the number will always be limited for, in our judgment, the small freeholder, managing his own farm, and forcing from nature a living for his family has ever been not only the strongest character in our National history but the best and truest type of American citizen.

*

SEVERAL weeks ago we advocated a change in the system of allotting the lands to be opened to settlers in the Indian Territory. It seems that the Government has decided to try to prevent the wild grab for land which occurred when Oklahoma was opened to settlement. All would-be settlers are to make formal applications. These are to be entered on cards, and on August 6 they will be drawn at random, and the farms awarded according to the drawing. We consider this far more sensible than the plan which gives the man with the fastest horse and the best gun an advantage which does not belong to him. It is said that so-called "sooners" purpose to get in ahead, squat on the best farms, and hold them on the plea that the drawing is unconstitutional.

*

ATTENTION is called to the letter from one of Mr. Wadsworth's constituents on page 511. "Let up on him a little," says our friend. We shall be glad to "let up" when he agrees to befriend the Grout bill rather than antagonize it. Last year we began to call attention to the attitude of Congressman S. E. Payne. Mr. Payne expected to brush away such criticism as one would brush a fly out of a plate. Before long he began to hear from the dairymen of Cortland County. In the end he was glad to "square himself" by promising to vote for the Grout bill. The chairmanship of the House Agricultural Committee is a National office. Our friend on page 511 seems to think the voters in Mr. Wadsworth's own district will settle this matter. That is where he makes a mistake. We still advise farmers everywhere to write letters of protest to Speaker Henderson.

*

LAST year many farmers in northern New Jersey were horrified to find much of their wheat riddled by an unknown insect. Those who delayed thrashing until late found the grain badly damaged. The insect proved to be the Angoumois grain moth—not at all a new insect, yet like many others more dangerous in certain seasons than in others. The damage last year was heavy, and now is the time to prevent even greater damage this year. The worst trouble last year occurred in wheat held long in stack or mow before thrashing. This gave just the condition needed by the insect for development. The remedy this year is to have the wheat thrashed at once—this month if possible. After thrashing store the grain in tight bags well filled and tied up tight. Either this or put the grain in tight bins, and if it begins to heat at all use bisulphide of carbon at once.

*

LAST week the most reliable business newspaper in New York printed a dispatch from Kansas in which it was stated that Kansas farmers in Osage County held up a train containing men going to work in the harvest fields and compelled them to handle their grain! That turns out to be a regular "funny" story from Kansas. Secretary Coburn, of the Department of Agriculture, writes:

Nothing of the sort occurred in "Osage County" or anywhere else in Kansas. We haven't any more wheat than we can harvest, but, of course, properly to care for the 5,000,000 acres necessitates getting up before breakfast for a few days. "Osage County" has but 1,607 acres of wheat this year, and could harvest it in half a day, whenever ripe, without holding up any trains.

These funny men on the daily papers must make a living in some way, but it is a shame that they try to make it by telling lies about respectable people and honorable communities.

*

A CITY man went out to visit a farmer who lives among the hills—far from the centers of so-called civilization. They began to discuss public matters, and the city man was astonished to find that his country friend had strong and original thoughts and ideas about deep and living questions. He was a little careless in some of his statements of fact and figures, and Mr. Farmer caught him up at once and corrected him. This astonished the city man, but it should not have done so. The country is, as it ever has been, the place for deep and searching thought. In the city there is a constant rush and excitement. Men learn to read mechanically, rarely thinking about what they have read. Life in the city is so full of change that there is little opportunity for true thought. All this is different in the country. Life is slower and saner. Fewer thoughts are presented to the human mind, and the tendency is to analyze and search for the truth. The result is often an original view of the matter, crude and rough perhaps, but strong and enduring. Yes, the country is now as ever the place for sound and healthy thinking.

*

AN excellent law, which is being enforced to some extent in this city at present, is that which forbids spitting on the floors of street cars, ferryboats and the approaches to stations. The extreme penalty for this offence is $500 fine or one year's imprisonment, or both, but the fines usually imposed are much less, generally $5. While violators of this law still go unpunished, because people dislike to complain of offenders unless an officer be present, still enough have been fined to stop many who were making nuisances of themselves, and a marked difference is noted in the condition of cars and stations. No one could consistently object to a man's expectorating as much as he desires when in the fields or woods; but consideration for others should deter him from indulging in public places in a practice which is disgusting, and likely to spread the germs of disease.

*

THE Government crop report is more or less of a wet blanket. The wheat crop promises to be tremendous, but most other crops are short. We have never had much confidence in these reports of such crops as corn or potatoes. How can any human being look at a cornfield before the tassels appear, and tell how much grain it will make per acre? Who can look at potato tops and give more than a fair guess as to what the yield of tubers will be? We believe that the Government statisticians try to be conservative, but many people do not or will not understand just what their figures mean. Last year the official figures for the apple crop were far too high, and were used to the detriment of those who had apples to sell. This year both private and Government reporters agree that all crops except wheat are short. Now let us see if prices cannot be made long.

*

BREVITIES.

Who comes and kicks you hard and long
While you are fighting in the throng?
Who strikes you then? Your enemy;
You look for that from such as he,
You know his trick, and warned, you go,
Prepared to ward his hardest blow.
But when, in some great fight you stand,
With enemies at every hand,
And though you bravely face them all
They crush you backward and you fall,
Who kicks you then—your enemy?
No—that's the time when such as he
Can well afford to take a rest,
For others do the job with zest.
Your so-called "friends" will gather 'round,
And kick you when you strike the ground.

THE cigarette habit in chicks—page 502.

MR. B. WRIGHT is about the only man who will do right.

ADVICE to dairymen—talk for the Grout bill and eat more cheese!

HOW can you expect to make a hen lay without laying yourself out to learn her needs?

IF part of your hay must be cut late—feed that part to the horses. Early cut for cows!

YES. Too much of patting the boy on the back is the sort of son stroke that prostrates character.

WE are able to announce several strong articles on Porto Rico and the chances on the island for Americans.

HERE is a thing we've said before—it's old but good, you know, be positive with negatives and learn to answer No!

THE city of New Orleans will begin a warfare against mosquitoes by spreading crude petroleum over all stagnant wet places.

OF the nine justices of the United States Supreme Court one is white and two are colored. Nothing need be said concerning the complexion of the remaining six.

PROF. WOODS wisely says that the farm is not the place where men should look for wealth. Grant that, and yet the farm remains the best place on earth for those who love it.

THE Government statisticians are already figuring the total corn crop of the country down to odd bushels. What nonsense that is when, even now, much of the corn is barely knee high.

"How long do you work your men?" we asked of a farmer recently. "As long as the horses can keep ahead of them!" A strange way that—to measure a man's job by a horse's capacity.

OUR friend on page 500 restates the old notion that driving nails into the trunk of a tree will kill or drive away borers. It will no more do it than pulling out a hen's tail feathers will kill lice on her head.

A NEW ordinance recently passed by the council of Tarrytown, N. Y., reads: "Any owner of a dog found at large without being muzzled will be subjected to a $10 fine." This seems unfair class legislation; there are other citizens besides dog owners who ought to be muzzled at times.

CROP PROSPECTS.

JULY 4.—Apples small crop. Corn doing nicely and prospect good, although acreage is not as large as would have been with more favorable early Spring. Potatoes doing well; the usual crop planted of the late varieties. Wheat much better than last year; grass or hay medium crop. E. F. D.

Albion, Pa.

JULY 4.—Apples, poor outlook; so of most other fruit except berries. Corn excellent almost everywhere; a brisk shower this evening after an almost unprecedented hot spell, will make it jump. Potatoes, too, needed rain badly, though not seriously injured yet. The hay crop was grand, and put in the barn in fine condition. Wheat, ready for harvesting next week, is one of the best crops we have had for years. But the oats will probably be almost a failure owing to rust, which is not usual in our part of the State. W. T. S.

Chester Co., Pa.

JULY 4.—The outlook for apples in this vicinity is very promising, particularly the late Winter varieties. Until recently, apples have not been cultivated for profit in this county, except in the western part. There could be seen, however, on nearly every farm a small orchard, just large enough to supply the family with apples, but in later years several large orchards have been planted. Farmers are beginning to realize the fact that there is profit in the growing of apples, particularly the York Imperial, Stark, Ben Davis and other late varieties. In the northern end of our county can now be seen a number of very promising peach orchards. The coming crop promises to be one of the greatest ever known in this locality. Most of the owners of peach orchards have been thinning the fruit very hard to prevent the trees from breaking. I have been engaged at thinning nearly all of the month of June. The corn crop promises to be a very good one. Very much of the corn has been planted very late. I finished planting June 22. As to the potato crop, few farmers have planted more than enough for the family supply. Those that have been planted promise to yield a good crop. The hay crop here is much heavier than expected. W. A. B.

York Springs, Pa.

JULY 5.—As to this vicinity, apples will give no more bushels than there were barrels in 1900. Corn and potatoes not more than 35 per cent of our usual crop; hay, probably about 75 per cent; oats almost an entire failure; everything is nearly two weeks late. There will be some peaches; also plums. Yet, notwithstanding this dark outlook, we realize this can be changed into a fairly prosperous year.

Waymart, Pa. T. H. T.

JULY 5.—Corn and potatoes are about 10 days late in this vicinity. The rainfall has not been excessive here, but the weather being cool and cloudy has retarded these crops. They are generally quite weedy. Oats are rather short yet, and getting rusty. The hay crop promises somewhat better than last season, but the grass is patchy, and there are many more weeds than usual. Apples, pears and plums are an entire failure here. Strawberries few and inferior, but raspberries will be abundant. With a prospective decline in prices of farm products in general the average farmer will hardly be able to laugh and grow fat to any great extent, as indicated by the present outlook. G. W. S.

Wilmore, Pa.

JULY 5.—The outlook for apples is not very good. Baldwins will be a short crop, and they are the principal apples grown in this vicinity. Early apples are also a short crop. Corn is looking well so far, and the prospect for a large crop is good. Potatoes were doing well up to the last two weeks, when the Potato bugs appeared in large numbers, both the striped and the old flying gray bug. Great complaint among farmers of the destruction they are doing. The Rose bugs are also doing great damage to cherries, peaches, etc. Cherries are also rotting a good deal. Peaches a very large crop, but will not be first class, as the farmers do not thin, but prefer to prop the limbs. The wheat is the best we have had for years. Hay crop is also good. E. A. B.

Kittanning, Pa.

JULY 6.—Hay was a fair crop. Wheat is being cut and is an enormous crop, the best for years, and is entirely free from insects. Early sown oats will be an average yield, while late sown will be short, owing to the drought now existing. Corn is a good stand, well advanced, and fields are free from weeds. Potato fields are promising, although very much in need of rain. Some cow peas sown for feed, but in most cases as experiments. Apples will be a light crop, but peaches, pears, plums and quinces will be plentiful. E. R. D.

Barto, Pa.

JULY 8.—The prospect for corn and potatoes is good. Hay about an average crop. The outlook for oats is not encouraging. They are affected with a rust, blight or insect of some kind. It looks at present as though some fields will be from one-third to one-half crop. Apples a very light crop. Wheat about average. E. A.

Big Bend, Pa.

JULY 8.—The prospect for apples is not very bright; about half a crop. Peaches, plums and cherries set very full, but are falling badly. Leaf blight or rust has struck the oats in all this section on both high and low land; prospect now for a half crop or less. Potatoes and corn look well, and with favorable weather will make a full crop; hay an average crop. C. D. G.

North Point, Pa.

JULY 8.—Apples made a very poor set except a few early varieties, and during the wet cold weather in May the leaves curled and dried, the fruit grew rough, unsightly and one-sided. I think there will be very few good Winter apples. Owing to wet weather potatoes were planted late, but came up fairly well except on wet or heavy land, but the extremely hot sun the last two weeks has turned the lower leaves yellow, so that some growers have given up the hopes of a crop. During July 6 and 7 we had very heavy rain, and perhaps there is some show yet for the late ones, but none at all for early varieties, they being a complete failure. Corn, owing to wet weather, was planted far later than ever before in this section, but it came up well, and has grown fast during this hot weather. If we have a very late Fall it promises a fair yield, but if caught by an early frost as we have been some years, fully 50 per cent would be ruined. We have few silos in this section. Hay, wheat and rye have made fair yields. W. H. W.

Newtown, Pa.

JULY 6.—June's heavy storms with rains left cornfields in bad condition. Wheat cutting has already begun with the appearance of a good crop. Oat fields look well with the exception of some rust. Too much rain at planting time for potatoes; those that stood the wet spell are looking well. By all appearances we shall have a heavy hay crop. This is not much of an apple-growing vicinity, but all trees are loaded; some complain of them failing. No spraying done here. B. F. W.

Circleville, Pa.

JULY 8.—Apples promise three-fourths of an average crop; area of potatoes large, and looking fine. Considerable complaint of blight; ours are not so affected. Corn prospects very good; owing to late planting not so far advanced as usual. Watermelons and cantaloupes are looking fine. Orange watermelon and Emerald Gem cantaloupe are the only varieties grown; market is at home. This is my son's sixth year, and he has 18 acres; wonderful success; all high land, gravel with sand. Our 50 acres of peaches are fine; have been busy thinning for two weeks. Abundance plums very full; must be thinned. We are just finishing cutting our wheat, which is fine and heavy in general. Our hay crop was fine, but as a rule hay is a light crop, owing to drought last season. No clover, all burnt out last season, except old fields or those seeded the previous year. This year's Timothy and clover is very fine. We have just picked 16 bushels of Fay currants from a small plot, that are very fine; plenty of rain for all crops; excessive heat; a number of horses have died of sunstroke or heat. E. H. C.

Bowmansdale, Pa.

THE WESTERN APPLE CROP.

At present I have no definite information as to other than local conditions regarding the apple crop. The outlook here is not at all favorable. Some of the best market sorts did not bloom abundantly and some set but little fruit. The season has been very favorable for the development of scab, and we may expect much dropping of the fruit, and poor quality in that which ripens. Ben Davis, Maiden Blush and Canada Red are a total failure. Baldwin very irregular, but promise about 20 per cent; Greenings promise better than any other variety of Winter fruit. Peach growing is the principal industry in this locality. The outlook is for an abundant crop of this fruit. WM. MILLER.

Ohio State Horticultural Society.

I learn from the papers and other sources that there is about 50 per cent of a crop of Winter apples in Missouri and Illinois; I should think from 50 to 75 per cent of a crop in Indiana. However, Indiana does not cut very much of a figure in the Winter apple market, as we have few large commercial apple orchards in the State. In a recent trip east, through Ohio, Pennsylvania and western New York, I noticed the prospects for the apple crop are very poor. The frequent cold rains during the blooming period seem to have prevented fertilization; the older orchards for the most part seemed to be very much neglected, and badly damaged by the web worm and canker worm. It looks very much as though commercial apple growing would finally be carried on by the few who are willing to employ all the means that are necessary to insure regular and good crops.

Indiana. C. M. HOBBS.

My present opinion is that the apple crop in Indiana, Illinois, Missouri and Kansas will be light, but that Iowa, in the western apple section, will have a good crop. The bloom in many parts was light, and there is much complaint of insects and of fruit dropping. The Illinois product has been placed at a half crop by some, but I am satisfied that in my own section of northern Illinois (which is not a large apple growing section), the crop will not be over 25 to 30 per cent. I do not think that, as a rule, any section or orchards which bore a full crop last year will give a full one this, and many of them are almost failures. As the crop last year was called almost a record breaker, although much shortened in final results by wind, bitter rot and hot weather, it can readily be seen what this means for the crop this year, if true. L. R. BRYANT.

Princeton, Ill.

From the present conditions existing in the West, there will not be over 50 per cent of the average apple crop, and this takes into account both Fall and Winter apples. Winter apples alone are very scarce. I really do not believe that there will be over 25 per cent of an average crop of Winter apples; at least this is the present indication. Weather is very hot and dry; everything needing rain. We have had a very fair crop of small fruit, and currants and gooseberries have been extraordinarily full. Cherries have been a full crop, and at present time the shipments are very heavy from our locality to the Northwest. Varieties are Early Richmond, Wragg, Montmorency and Dyehouse. Plums promise a good crop. Grapes at least promise a full half crop. Pears and peaches, where planted, are making a great show, but with apples we are sorry to say this is an "off" year with us. M. J. WRAGG.

Iowa Hort. Society.

From my information to date, based on observation and reports from reliable sources, the apple crop will not go over one-half of a fair crop. Northern Missouri has about a half crop, and the apples are in good condition. Southern Missouri has more, perhaps 75 per cent of a crop. Kansas not over half crop, and Mr. Wellhouse, the president of the Kansas State Horticultural Society, said several days ago, that unless there was a favorable change in the weather inside of a week, the apple crop of Kansas was gone; that already they were burning and dropping from the trees. The greatest shortage in general over the West was caused by a great many Ben Davis not blooming, and it is our leading commercial apple. I have two sons who have 12,000 apple trees in commercial orchards, one-third of which is in full bearing, but they will not make one-fourth of a crop. Smaller orchards, with less Ben Davis in, show better. But I am confident that 50 per cent of a fair average crop is the outside limit for the West, and it is my opinion that it will fall below this. We never have the bitter rot in northern Missouri. N. F. MURRAY.

Pres't Mo. Horticultural Society.

I am not qualified to speak for any except this section, and even here the conditions in different localities, in different soil, with different varieties, and with orchards of different ages, are so diverse that it is difficult to give an intelligent report. The Ben Davis, which comprises a large part of the crop, set very light, and at no time has there been promise of more than a light crop of this variety. Young orchards are bearing better than old ones. The varieties which are most promising are Jonathan, Missouri Pippin, Willowtwig and Winesap. An unusual amount of twig blight developed this season. Some varieties, notably Jonathan, suffered more than others. It seems now to have run its course for this season. No more twigs are dying, and no injury to the fruit is apparent. We are suffering now from an unusually severe drought. There are rumors that farther west the apple crop is destroyed. In the Ozark region of southern Missouri and Arkansas the damage from drought and consequent dropping of apples is said to be very great. Here, I think, no great damage has yet been done to the apples by the drought, but it is a critical period for the crop, and if the drought continues much longer it is likely to prove disastrous. The fruit here is smooth and comparatively free from worms. Not much difference is apparent between orchards that were sprayed and those that were not. One things seems to be certain, however, and that is that no grower need to part with his apples for anything less than a good round price. W. D. C.

Edwardsville, Kan.

EVENTS OF THE WEEK.

DOMESTIC.—Judge Faweett, in Omaha, July 3, refused an application for an injunction against a Mexican bull-fighting exhibition, saying he was "satisfied that the bull fights will not present one-tenth of the brutality that is to be witnessed on a football field." . . . . The body of Abraham Lincoln, which has been reposing in a temporary vault at Springfield, Ill., while repairs were being made on the Lincoln monument, has been secretly replaced in the private vault within the monument. . . . . July 4, a big business building at Baltimore, Md., chiefly occupied by engravers and printers, was destroyed by fire; total loss $650,000. . . . . At McKeesport, Pa., July 4, five persons were killed by lightning, while seeking refuge under a tree. . . . . Revised reports of the recent flood in the Elkhorn Valley, W. Va., place the total loss of life at 36. . . . . Three masked men held up a train on the Great Northern Railroad at Hinsdale, Mont., July 3, broke open the express safe with dynamite, and escaped with $83,000. . . . . July 6, fire devastated the town of Versailles, O. Many people are homeless and destitute, and the loss is said to be over $500,000. . . . . A farmer near Williamsport, Pa., is under arrest, charged with sending through the mails a challenge to fight a duel. The offense is a misdemeanor in that State, punishable with $500 fine as well as three years in prison. . . . . Snow fell at Houghton and Calumet, Mich., July 6.

FARM AND GARDEN.—As a result of the drought and intense heat in central Missouri the stockmen and farmers are shipping out all of their stock which is in any way marketable. The farmers are becoming distressed and alarmed at the intensely hot and dry weather. The wheat crop, which was generally good, is all the farmers have to bank on. The oat and hay crops in most instances have been pastured and are gone, the pastures are as scorched and bare as in August, and the corn crop bids fair for a complete failure unless rain falls soon. The cornfields are well cultivated and the plant is in excellent shape to grow if it had the necessary moisture.

It is reported from Mattoon, Ill., that the Union Broom Supply Company has cornered all the broom corn crop of 1900, and raised the price to $120 a ton. Fifteen eastern manufacturers are said to be in the combination.

The Treasury Department, July 9, drew warrants aggregating $1,200,000, or $25,000 each for 45 States and two Territories, being the maximum amount provided by Congress in the act of August 30, 1890, for the endowment and maintenance of colleges for the benefit of agriculture and the mechanic arts. The money is the proceeds of the sale of public lands.

The twenty-seventh biennial session of the American Pomological Society will be held at Buffalo, N. Y., September 12 and 13, 1901. The details of the programme are being rapidly determined and promise a rare treat. Among those announced to speak are L. H. Bailey, J. H. Hale, S. D. Willard, L. A. Goodman, H. M. Dunlop, Geo. T. Powell, Wm. B. Alwood, Judge Fred Wellhouse and many other well known men. The fruit exhibit of the Society will be held in the Horticultural Building at the Exposition, and all exhibits of the Society will be eligible for exposition awards.

A severe outbreak of anthrax is reported in Bolivar County, Miss., affecting mules, horses and swine.

Government Weekly Report.

In the northern and central districts east of the Rocky Mountains, the heat continues excessive, and crops are suffering greatly. Early corn in Kansas, Missouri, Oklahoma and Texas is damaged. In Nebraska, Iowa and the Ohio Valley, some damage is reported, but conditions are not so serious. The Winter wheat harvest is practically finished in Kansas, Missouri and the lower Ohio Valley, and is in progress in the northerly sections. The coast States are having abundant rains, which have hindered harvest work. Spring wheat in the extreme north looks generally promising, although parts of Dakota are suffering from drought, causing the crop to ripen too rapidly, and large areas have been flooded in northern Minnesota. Oats in the central valleys are in bad condition. New England and New York are gathering a large crop of hay. Cotton conditions are improving, though the plant is still small and in need of cultivation. Tobacco cutting is in progress in the Carolinas. Apple reports continue unfavorable. The fruit is suffering from sunscald in Missouri and adjoining States.

Woman and Home

From Day to Day.

FINERY AND FUSS.

The women folks are fixin' for a weddin', an' the fuss
The house is in here lately's only equaled by the muss
Of bastin' thread a-lyin' on the floor an' silken scraps
A-slippin' to the carpet off the sewin'-women's laps.
The finery they're fixin for our daughter's weddin' day,
An' her wardrobe, called a trousseau, will be simply grand they say;
There wa'nt no women flyin' round as crazy as a loon
When I married Mamie's mother in the golden month o' June!

I cannot help a-thinkin', when these ruffled things I see
The women folks a-makin', which they say's a lingerie,
All pieced up with embroidery, an' tucked around with lace,
In her mother's clothes assortment them things never had a place.
Of course I like t' see 'em, an' it's satisfyin', too,
T' think our girl can have all such, like folks that's well-to-do,
But with much less we entered on a happy life's forenoon
When I married Mamie's mother in the golden month o' June!

They've been t' see the florist an' have all arrangements made
For flowers, palms an' orchids—quite a fancy price they paid.
A very stylish preacher's been engaged t' tie the knot,
An', all in all, it seems t' me that nothin's been forgot.
We didn't have no flowers, but our life's been one of bliss,
We had a plain ol' parson, whom the bride paid with a kiss,
But two lives were simply blended an' two hearts were set in tune
When I married Mamie's mother in the golden month o' June!
—Roy Farrell Greene in Brooklyn Life.

*

A FAVORITE dish just now at one of the popular New York restaurants is planked steak. The steak is covered with mushrooms, and served on a well-seasoned oak board, like planked shad, the board having a well to hold the juices.

*

BABIES' bibs are never very ornamental, but the new fichu shape is rather an improvement on the old one. It is triangular. Long muslin strips extend from two of the points; they are crossed behind, and are then brought around under the arms to the front, where they fasten at the lower point of the triangle with a bib pin.

*

EVERY day, on our way to the office, we pass a large fountain in City Hall Park, whose sparkling basin offers an irresistable temptation to the small newsboys and casual gamins these hot days. Whenever the coast is clear from intruding policemen, some of the boys begin to paddle in the tempting water, and on more than one occasion we have seen a small boy splash in, clothes and all, for a bath, his well-ventilated wardrobe, like a good Baptist, being all the better for total immersion. Of course, if a policeman turned up, he would escape from his unauthorized bath, and rush dripping across the park, pursued by the recriminations of his blue-coated enemy. During the recent hot spell one small boy decided on a really luxurious bath in the same fountain. It was about six o'clock in the evening, when the home-going crowd was thinning a little, and the boy undressed deliberately and splashed into the water with great content. The policeman was invisible, and the small law-breaker was luxuriating in fresh pink cleanliness when he climbed out of the basin and looked for his clothes. They were not there! Some envious miscreant had stolen them while while he was absorbed in his bath. The result was that a highly excited small boy rushed over to Park Row, in a classical absence of drapery which, while it would call out no remark in the tropics, was distinctly unconventional in New York. A kind-hearted workingman, noticing the boy's plight, took off his coat for a covering, and escorted the unfortunate out of sight with a promise to replace his missing garments. It seems likely that one small boy, at least, will abstain from surreptitious baths in future.

*

DURING the hot weather it is a good plan to cook the breakfast cereal the night before, turn into individual cups or molds, and serve cold the next morning, turned out of the molds, which should be moistened with cold water to prevent the cereal from sticking. A garnish of fresh fruit will often persuade a fanciful eater to take the cold molded cereal, when it would not be eaten hot. Scalded cream is very nice with it. If any cereal is left from breakfast, it may be used in gems or muffins; either wheat or oatmeal is excellent for this purpose.

3854 Tucked Skirt, 22 to 30 in. waist.

*

THERE has been an epidemic of green sun umbrellas lately; they look very well when carried with a blue gown, but when put to their legitimate use as a shade they have a most deadly effect upon the complexion. Of course they are really comforting to the eyes in a hot sun. There are some shades of gray-green, however, that are very cool and pretty, and not so trying to the complexion. It is a pity that more women do not study cool effects in their Summer wardrobes; violent shades of pink and red add to the grilling effect of the dog days. This season ox blood, a tint a few shades redder than watermelon, has been extremely popular in mercerized cotton, madras and dimity, both for waists and skirts, and its effect is decidedly heating. All shades of pink seem to have an enormous vogue.

*

LAST Summer it was the transparent shirt waist that aroused comment; this year women who like conspicuous styles for street wear are appearing in cotton gowns with low neck and elbow sleeves. The sleeve usually chosen is not puffed, but of the coat shape, ending just above the elbow, sometimes finished with a ruffle, but more often with a beading through which ribbon is run. It is quite likely that the undersleeves which have been in vogue have led up to this fashion, since nothing was easier than to discard them on the approach of warm weather. The necks are collarless, cut either square or round, very rarely V-shaped. These décolleté gowns have rather a startling effect when seen on the city streets. Two young women seen shopping recently wore gathered white muslin waists cut round at the neck, with short little sleeve puffs, the general effect being so strikingly like that of an old-fashioned cambric chemise as to cause a feeling of decided embarrassment on the part of more conventional people.

The Rural Patterns.

In the skirt shown, the tucks are laid in groups of two each and extend from the waist to within flounce depth of the edge of the skirt, where they are left free to form becoming fullness and folds and are slightly overlapped at the belt to give the perfectly snug fit. The back is simply plain, with fullness arranged in gathers. To cut this skirt for a woman of medium size, 8¼ yards of material 21 inches wide, 6¼ yards 32 inches wide, or 4¼ yards 44 inches wide will be required, with 13 yards of lace to trim as illustrated. The pattern No. 3854 is cut in sizes for a 22, 24, 26, 28 and 30-inch waist measure; price 10 cents.

The simple round yoke blouse is becoming to many figures and is one of the latest styles shown. The model shown is of pale blue louisine silk, with trimming of silver and black braid with waved edges; but the design is equally well suited to all washable materials. The round yoke is smooth and plain, while the lower portions of the waist are gathered and joined to the lower edge. The sleeves are in bishop style with narrow cuffs and the neck is finished with a curved stock collar that closes at the center back. To cut this waist for a woman of medium size, 3½ yards of material 21 inches wide, 2½ yards 32 inches wide, or two yards 44 inches wide will be required, with 12 yards of braid to trim as illustrated. The pattern No. 3858 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure; price 10 cents. The wrapper shown also has the round yoke, and is comfortable and becoming. The pattern comes in the regular sizes, and costs 10 cents.

3858 Round Yoke Blouse. 32 to 40 in. bust.

3845 Round Yoke Wrapper, 32 to 42 in. bust.

When Phyllis Cans Peaches.

In the back yard is the big Crawford peach tree with its loaded boughs bending until they have to be propped up all round lest they break. Phyllis is canning and there she sits in her rocking chair on the back porch surrounded by eight sparkling glass fruit jars. In a saucepan—white enamel with a blue edge—she has ready a syrup made of sugar and water, the water used being only warm enough to melt the sugar, not hot enough to melt her. A willow basket full of the great crimson and yellow fruit is gathered, and she peels and packs the halves in the jars like shingles on a roof or scales on a fish's back. As each jar is finished she fills it with syrup from the blue and white saucepan. Meantime Phyllis is not getting overheated. She glances at the loaded peach tree, listens to the twittering of the birds in its upper branches and the sweet breath of the honeysuckle shading the porch adds to her pleasure, driving weariness and care far away.

When all the jars are done, she lifts the tray upon which she has placed them and vanishes into the kitchen. There she has ready the washboiler scrubbed and scalded. In it she arranges the jars and pours around them a few quarts of cool water. Of course the jars must not rest upon the bottom of the boiler or they will break. Anything may be placed beneath them so that it is not made of wood, as that flavors the fruit with the odor from its own boiling. Phyllis, as it happens, uses horseshoes, and that may account for her luck. The boiler is placed on the front of the stove and covered, after which she renews the syrup in the saucepan and places it where it will presently boil.

Half an hour, more or less, should steam the peaches soft. Phyllis pierces them with a fork to see. If done, the boiler is lifted to the floor. One by one the jars are set on the back of the stove, replacing the cover to the boiler each time, and filled with the boiling syrup, the rubber adjusted and the top screwed down. This is the only hot part of the task, and Phyllis—who hates the heat—can accomplish it in a few moments.

And Phyllis says that all the fruits she ever heard of—plums, apricots, pears, cherries, berries, can be treated exactly in this fashion, the time of steaming varying with the fruit from 15 minutes upward. The flavor is perfect. The fruit remains unbroken in the jars, and the syrup is clear and beautiful. It perfectly feasible to make sweet pickles in the same manner, the usual syrup of vinegar, sugar and spices being poured over them. If the jars when put into the boiler are cool and the water poured around them is also cool, they heat up gradually and the jars do not break. The amount of water used in the boiler need only be enough to give off steam, a depth of a few inches: Phyllis's washboiler may be replaced by any other covered vessel which permits of steaming the jars. Some of the steam cookers in the market will hold four jars at a time and do the work over a two-burner oil stove. Only remember that whatever receptacle is used, must be absolutely clean and closely covered.

Everything must be sealed with the usual care at the end, the jars kept scalding hot until the moment of putting on the hot tops, and the syrup used for filling kept at the boiling point. These precautions are necessary for any process of fruit canning, and if they are properly attended to, the steamed fruit keeps perfectly. Indeed, Phyllis learned this process from her mother, who asserts that it was the only one considered safe when the glass fruit jars came into use, and canning superseded preserving. —Table Talk.

With the Procession.

ALL one's life is music if one touches the notes rightly and in time.—Ruskin.

OUR life is always deeper than we know, is always diviner than it seems, and hence we are able to survive degradations and despairs which otherwise must have engulfed us.—Henry James.

LIFE, Love, Religion, these three are one. Tell me what you love supremely and I will tell you your destiny. Our philosophy and our morality must lead us at last to one thought—the idea of God.—Fichte.

YOU must love your work, and not be always looking over the edge of it, and you must not be ashamed of your work and think it would be more honorable to you to be doing something else.—George Eliot.

We mortals, men and women, devour many a disappointment between breakfast and dinner time; keep back the tears and in answer to inquiries say, "Oh, nothing!" Pride helps us; and pride is not a bad thing when it only urges us to hide our own hurts—not to hurt others.—George Eliot.

Miss Jepson's Tedder.

The horse knew she was headed toward home, and jogged steadily along the road. It was late May, and the hills and fields were freshly green. Mrs. Jepson sighed contentedly. "How lovely it is," she said. There was a rapt expression on her pale, aristocratic face as her eyes rested on the scene before her. Miss Jepson was driving, and she too looked across the stretches of field and meadows to the hills beyond. Suddenly she stopped the horse with a jerk. She leaned forward, with parted lips and intent eyes.

"Mother," she said almost sharply, "do you see that?"

"What, dear?"

Miss Jepson pointed with one hand. "Right in this field," she said rapldly, "under that old apple tree. Don't you see? It is my tedder."

"Your tedder?"

"Yes. Don't you know, Mr. Tobey was the last one to have it, and he promised to house it for me through the Winter, and this is how he has done it." Her voice was indignant, and her eyes flashed. "I haven't been along this road since Fall. It was out there then, but he promised faithfully to put it under cover."

"Well," said Mrs. Jepson mildly, "perhaps he did, and maybe he's only just put it out here."

Miss Jepson turned back the lap-robe and handed the reins to her mother. "I can tell by looking at it," she said, and she stepped to the ground.

"Oh, don't go!" cried Mrs. Jepson. "Suppose Dolly should start?"

"You can stop her if she does," said Miss Jepson briefly, "and besides, she won't."

She let down the middle bar of the fence and crawled through. Then with a long swinging step she went across the field. One glance at the tedder was enough to show that it had been out all Winter. The tires were rusty, as were all the unpainted metal parts, and where the paint had been bright it was now dull and weatherbeaten. Miss Jepson regarded it intently. She was a person who made decisions quickly. She stepped between the shafts, stooped and lifted them, and then pulled. It started hard, but the field sloped ever so gently to the road, so it went along quite easily after the first few rods. When she came to the fence she had to stop and take down the bars, then she pulled the tedder through and it went down the little dip to the road with a bump and clatter.

"Oh, Mattie!" wailed Mrs. Jepson. "What will people think? What are you going to do? What will Mr. Tobey say?"

Miss Jepson made no answer. She was somewhat out of breath, and besides was busy putting up the bars. When that was done she wheeled the tedder to the back of the buggy and rested the shafts on the hind axle. "Pass me the hitch-rope, Mother," she cried in a matter-of-fact tone.

"You're not going to take it home?" Mrs. Jepson cried, as she weakly passed out the rope. Her face was anxious and careworn. "Everybody will see us, and they'll think we are crazy."

"There!" said Miss Jepson quietly, "I think that will hold till we get home." She got into the buggy, took the reins from her mother's hands, and spoke to the horse. Dolly had grown tired of waiting, so she started off briskly. The tedder followed with a tremendous clatter. The little projections on the wheels, as they passed over the hard road, shook the whole clattering structure. Mrs. Jepson tried to speak, but the noise drowned her words. At length a hill was reached and Dolly settled into a walk. This reduced the clattering so that Mrs. Jepson could protest feebly. "Why couldn't you have sent somebody for it," she said. "And why couldn't you let it stay? Mr. Tobey will want it this Summer."

"He never will have it," Miss Jepson cried hotly. "He's lied to me, and he sha'n't have it. I won't lend it to anybody. I'll have it in the front hall for a hatrack first."

They were passing a farmhouse now, and Mrs. Jepson shrank back into the farthest corner of the buggy. "I shall dle of mortification," she moaned.

"Don't be silly, Mother," said Miss Jepson. "It's milking time, so the men won't see you, and the women are getting supper!"

They reached home at length, and Mrs. Jepson was so worn out with nervousness that she had to lie down awhile before she could eat supper.

A day or two later Miss Jepson came into the house laughing. "Oh, Mother!" she said, "it is so funny. Mr. Tobey was going by and he stopped and offered me $15 for my tedder. I didn't see what he was driving at and refused. Then he confessed very abjectly that he had left it out all Winter and that now it had been stolen. He felt pretty badly about it, but when I told him that I was the one who had stolen it and that I was not going to let it any more, he was very much astonished and went off in a rage. It is strange that no one who saw us should have told him of it."

"I think you are foolish to refuse to let the machine," said Mrs. Jepson. "We are not exactly wealthy, and the money is quite useful; besides, the machine does you no good out in the barn there."

"I know it," said Miss Jepson soberly, "but I have said it." Suddenly she leaned forward and an eager, excited look came on her face. "Why, Mother!" she cried, "why couldn't I run the tedder myself? I know I could do it, and I'd love to, and Dolly doesn't have enough to do."

Mrs. Jepson looked at her daughter almost sternly. "You are not serious, Mattie," she sald. "I don't like to hear you speak of such preposterous things."

"But I am serious," Miss Jepson said earnestly. "Why shouldn't I do it? There would be no impropriety in it. We have a reputation for eccentricity; why not live up to it?"

"I am sick of the way we live," she went on vehemently. "Here I am, strong and well and able to do all kinds of hard work, and you won't let me. We have a girl to do the housework, because it is the proper thing, and I spend my time reading, and writing letters, and making calls, and sewing. I hate it all. I want to do something different. The only bit of liberty I have is in taking care of Dolly. You let me do that because both you and Margaret are afraid of her. I suppose you think that all there is to taking care of her is the feeding and watering. Did it ever occur to you to wonder what makes Dolly's coat shine so? It is because I spend so much time brushing her. You didn't know your daughter had such depraved tastes, did you? But the pleasantest hour of my day is when I am out working over the horse. Now I mean to go a step farther and take Dolly and the tedder and turn people's hay for them."

"Mattie!"

"Oh, Mother, dear!" cried Miss Jepson, with a sudden change of manner, "don't look at me so. If that is the way you feel about it, I'll never do it in the world. Forgive me. I didn't think you'd take it so."

"I never could hold up my head again," said Mrs. Jepson, with a little sob.

The June days came, and soon it was haying time and the clatter of the mowing machine was heard in the land. And then one morning Mr. Lang—the Jepsons' nearest neighbor—drove into the yard and made a call on Mrs. Jepson. Half an hour went by, and then Mrs. Jepson sent for her daughter.

Miss Jepson came into the room looking tired and discontented. Mr. Lang rose to meet her and shook her hand cordially. He was a handsome, elderly man, with a kindly, sympathetic manner.

"Miss Mattie," he began, when they were seated, "I came this morning to talk with your mother on a matter of business, but she has referred me to you. You see two of my hired men have left me, and there I have several acres of grass down and no one to turn it. I thought I might hire your tedder, but your mother tells me you have refused to let it any more. So I proposed that you might do me a great favor by taking Dolly and riding the tedder yourself. Of course I ought to have one of my own, and if you refuse to help me out, why, I shall have to go to the expense of getting a new one, I suppose. Your mother thinks perhaps you can be induced to do me the favor, so I want to see if I can soften your hard heart."

Miss Jepson was looking at her mother with dilated eyes. "Are you willing, Mother?" she asked.

Mrs. Jepson did not look up. "Certainly," she said with emphasis, while a slight color tinged her cheeks. "Mr. Lang has been too kind to us in times past for you to refuse to do a little thing like that for him."

Miss Jepson stood for a moment in speechless surprise, then her face lighted with interest. "I'll be over at your house in half an hour. I must put on my bicycle skirt first, and I think the tedder will need some oiling."

When she went out to the barn, Mr. Lang's horse was still in the yard. She looked at it quizzically, then a puzzled expression came into her face.

"I wonder how he did it?" she asked, as she reached for the oil-can. "Was it hypnotism, or something else? I don't believe it was hypnotism; Mother has too strong a will for that. No, it must have been the other. Well, why not? It is romantic, of course, and eccentric, perhaps, but what of it? I'm sure he is a dear, and she is too."

And so Miss Jepson smiled a kindly and indulgent smile as she harnessed Dolly into her tedder.

SUSAN BROWN ROBBINS.

Suggestions in Jelly Making.

"How do you get your jelly from the preserving pan to the tumblers?"

"For ordinary tumblers I use a china coffee cup with a good handle, which holds more than the quantity required for each tumbler, but which if dipped deep enough in the preserve pan to get filled to within an inch of the top will pour easily into the glass without waste. You can get exactly the measure after one tumbler is filled. A saucer or small plate held in the left hand and moved with and under the cup will catch all drops. In case you do not fill a tumbler full from the first dip add the requisite quantity immediately afterward, so that all will stiffen together, otherwise there may be a separation in the contents of the tumbler when it is turned out."

"What is your general rule for making fruit jellies?"

"Of course there are exceptions, but you will find the following a good rule: Wash and drain the fruit, put it into a stone crock or fresh enameled or granite ware pan; cover it with a large china plate. Set this vessel in another larger one of hot water; let it come to a boil and cook until the fruit in the inner vessel becomes tender. Do not let the boiling water get into the fruit. When it is tender enough it will begin to break. Now it is ready to pour into a freshly scalded flannel bag, which should be supported by tape loops at the top over a stick laid across two chairs and hung directly over a large china bowl or good enameled pan. The chairs may be lifted to a large table if more convenient; they may be reversed and the rungs used to support the stick instead of the seat or back, thus varying the height. It is usually more convenient to place the bag near the stove, so the fruit can be dipped out without moving the preserve pan or kettle. When all the juice has run through that will come willingly the pulp may be squeezed into another dish. If you arrange to leave the juice dripping all night you will find in the morning that there will be nothing to squeeze, but sometimes it is more convenient to hurry it up. Measure the drained juice, and to each pint allow a pint of white sugar and one-half of the beaten white of one egg. Mix together; put to boil rapidly; skim, but do not stir, as stirring will break the continuity and spoil the jelly. After 20 minutes try a spoonful in cold water; if it jellies it is ready to put into tumblers. Or try a spoonful on a cold saucer set on ice for a few moments. If it is boiled too long or too slowly it will be ropy; if too much sugar is used the jelly will be grainy. Ripe grapes jellied according to this recipe will require three-fourths of a pound of sugar to a pint of juice; so will apples and black currants. Fruit should never be used for preserving or jellying when gathered directly after a rain. It should be selected when just ripe and firm for the best results."

"Sometimes my jelly boils so fast it rises in the kettle, and I have to draw it back a little. Do you think it is hurt by moving it?"

"Not if you watch it and keep it boiling. Of course the fire should be looked after and a good and steady heat arranged for before putting the juice to boil. If the coals are high in the grate it will probably be necessary to set the kettle on the lid, possibly removing it toward the finish. The juice should be watched, and when one reflects that 20 minutes under ordinary circumstances is all the time necessary for the boiling it does not seem too much to devote to close inspection. The time is counted from the moment the bubbling begins. Sometimes you will find when fruit is very rich in juices that it will jelly in 15 minutes. I have often made currant jelly and found it to thicken as soon as the sugar dissolved and it came to a boil. There is no cause for alarm if fresh jelly does not become hard in a few hours. The jelly-maker has the greatest success who seizes the first jellying moment and saves thereby to her family two or three tumblers that would otherwise be lost in evaporation. Tumblers should be filled to the brim; there is always a slight subsequent shrinkage."—Chicago Record-Herald.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

NO MORE SPOILED FRUIT—Canning made easy and sure by using my Standard Patent Self Melting Self-Sealing Wax Strings. Very convenient and economical. Inquire of your dealer or send me his name and 45 cents in stamps for 100 strings by mail. *Mention this paper.* C. C. FOUTS, Middletown, Ohio.

Never let a little child's cold "run on." There is sure danger and perhaps death at the end of it. The infantile organs are always helped by Dr. D. Jayne's Expectorant, and the little ones like it.—*Adv.*

BUSINESS BITS.

Elmore Station, Ala., June 13, 1901.
Dr. B. J. Kendall Co.,
Enosburg Falls, Vt.
Dear Sirs:—

After using your Kendall's Spavin Cure and Kendall's Blister we find them the best we have ever used. We have cured spavin with it when all other remedies failed. It is good for all you claim and more. We keep it on hand, and wish every suffering man and beast had the opportunity of using it. We believe it is a blessing to all that use it.

Respectfully,
C. E. King and J. E. Bailey.

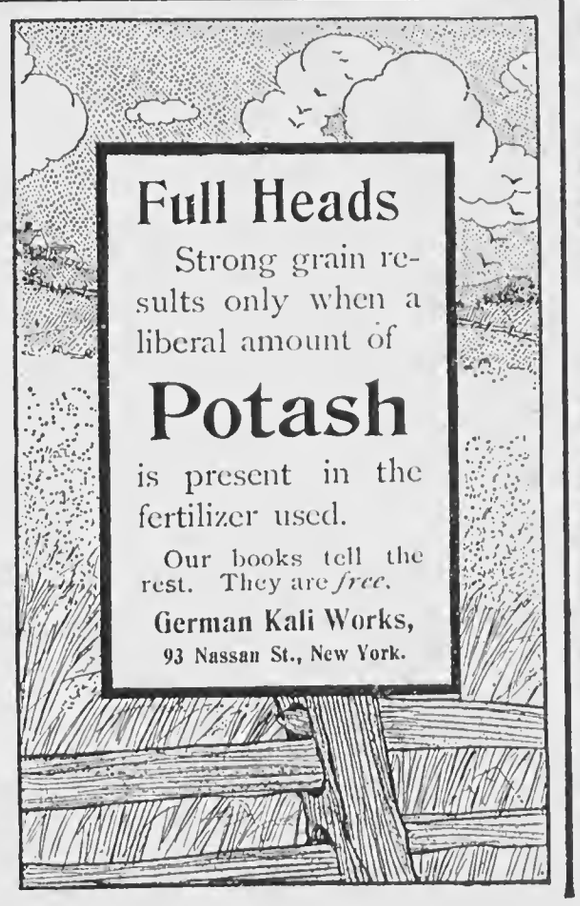
THE Osgood Scale Co., of Binghamton, N. Y. has always had so much faith in their own goods that they were willing to send scales on trial anywhere in the U. S. They never had scales returned on their offer. They are constructed so simply that any good farmer with common sense can erect them himself. They have a large white beam box, heavy brass beams, double or compound, steel-lined, forged-iron loops, heavy castings, every part interchangeable, no repairs, and many advantages over others. Write for catalogue and special price. No advance in price on account of trusts. Do you know of any neighbor who ought to have one? Can you interest him? It will pay you.

WE call the attention of our readers to the advertisement of Notre Dame University, one of the great educational institutions of the West. Those of our readers who may have occasion to look up a college for their sons during the coming year would do well to correspond with the president, who will send them a catalogue free of charge, as well as all particulars regarding terms, courses of studies, etc. There is a thorough preparatory school in connection with the University, in which students of all grades will have every opportunity of preparing themselves for higher studies. The commercial course intended for young men preparing for business, may be finished in one or two years according to the ability of the student. Fifty-seven years of active work in the cause of education have made this institution famous all over the country.

OWING to inadequate equipment, the Arctic explorers heretofore have had to face many perils and discomforts that do not now confront Evelyn B. Baldwin, the leader of the Baldwin-Ziegler Expedition, who has just sailed for Dundee, thence to proceed to San Joseph's Land, whence the complete expedition starts for the Arctic regions. Everything that money can buy or experience suggest to ensure safety and comfort, has been procured, and the explorers leave on their long trip with a magnificent equipment; taking with them supplies for over three years. The cargo of their ship, "America," which has been especially fitted up for the voyage, includes a large quantity of Ruberoid Roofing, manufactured by the Standard Paint Company, New York and Chicago, and a large amount of galvanized wire netting. This Ruberoid is to be used as a housing or inclosure for the ship when the ice stops its further progress, and as a covering for the huts or shelters erected along the route for the 40 men, the hundreds of dogs and other animals, and the supplies. The galvanized iron wire will be used as a framework or support, for the Ruberoid, which will be laid over it.

The Leading Crops.

Reports to the Department of Agriculture indicate the largest wheat crop this country has ever known. The indications are for 705,000,000 bushels. The greatest crop now on record was 675,000,000 bushels in 1898. The indications now are that the corn crop will be short. Still, it is too early now to make any accurate statement. Rye and barley will be much the same as last year, while oats are less promising than one year ago. Potatoes show a decreased area, and the crop is also poorer than last year. The chances are therefore for a smaller crop. The condition of sweet potatoes is unpromising, and the hay crop is proving a disappointment, as it was found that meadows were thin, and that while the grass was tall enough there was little body to it.



Wants, For Sale or Exchange

Farm Managers, Gardeners, Buttermakers, etc., always on hand. No charges to employers. Write us Rural Science Agency, Durham, N. H.

WANTED—A man. Also, 800 chicks, April or May-hatched pullets. W. Wyandottes or Leghorns preferred; must be strong, vigorous stock. WANTED.
FRUITS, VEGETABLES, HOTHOUSE PRODUCTS, FANCY EGGS, POULTRY, Etc. We solicit your consignments, and can secure highest prices for prime goods. Write us for shipping instructions, stating what you have for sale.
ARCHDEACON & CO., 100 Murray St., New York

Free for a Club of Four.

Here are 44 first-class tools for repairing shoes, rubber, harness and tinware. We are going to give no arguments why you should have them. The reasons and uses are apparent to every one. There is nothing like mending a hole, putting in a stitch, or driving a nail in time. It

always saves time and money. It often saves lives. The price is $2 alone, but it need cost you only $1. Send us one new subscription with $1, and $1 extra—($2 in all) and we will send you the outfit complete, or we will send it to you free for a club of four yearly subscriptions at $1 each.

BOOK BULLETIN

For Sale by The Rural New-Yorker

FITTING Sheep for Show Ring and Market. The price of this book is $1.50 instead of $1, as quoted recently in this column.

ALFALFA, by F. D. Coburn; 161 pages. Practical information on the history, production, qualities, value and uses of this plant. Extensive reports of the results of trials in various States. Price, postpaid, 50 cents.

PLUMS and Plum Culture, by F. A. Waugh; 371 pages, 117 illustrations. History of the plum; descriptions of varieties; propagation and orchard management; diseases and remedies; blossoming charts; geography and climatology. Price, postpaid, $1.50.

THE RURAL NEW-YORKER,
409 Pearl St., New York.

Market Briefs

PICKED UP HERE AND THERE

LIGHT RECEIPTS.—During the recent hot weather the receipts of fruits and vegetables at New York were unusually light for this season of the year. This was fortunate, as otherwise there might have been serious loss all around. In such severe weather people do as little buying as possible, and dealers must do extra hustling to get rid of the stuff, or it will spoil on their hands. No doubt the reason for this falling off in receipts was the fact that the hot wave covered nearly all of the producing district, and shippers felt the general languor, handling only what was absolutely necessary. This evened up matters, and the market came through in very good condition.

AN AGGRESSIVE GROCER.—He recently commenced business in an up-town section of New York where grocery stores are, if anything, more numerous than saloons. It did not look as though there was any chance for him to work up a trade, but he did it in short order by cutting the prices on some goods and advertising this fact in a striking and original manner. Sandwich men, that is, men carrying two signs fastened together with ropes and hung over the neck, reaching below the knees, are a common sight for advertising purposes. This man fixed up six sets of these signs, painted with gorgeous lettering of white and red. Then he hired six men who marched in "Indian file" about four feet apart slowly along the streets. This odd procession attracted great attention, and, when last seen, the new grocer was doing a good business.

FRUIT NOTES.—A continued improvement is noted in the quality of southern peaches arriving, and the market is firm on the better grades. The Californias seen thus far are the same as in former years, quite fair in appearance, but worthless as compared with the eastern fruit. The supply of cherries is light. Most that are seen are the late sour varieties, which are in good condition and wholesale at 25 to 40 cents per eight-pound basket. There are a few strawberries in the market. The best that I saw were Oswego fruit, each basket wrapped in waxed paper. I do not remember having before seen so many fine currants on the street at one time, yet they go slowly, some of the best retailing at eight cents per quart. Southern apples are quite plentiful, although there is but little call for them so long as there is so much other better fruit to be had. Early apples strike this market about the same time as good peaches, and have to take a back seat. The same is true of the southern pears now arriving. The watermelon demand is heavy, but prices have dropped owing to excessive receipts. Muskmelon conditions are improving, and high prices are obtained for the better Georgia stock. So many worthless muskmelons are sent in early in the season that buyers become afraid of them, and some time is required to work up a trade after the better grades arrive. A great many are served in restaurants, where they are cut in two, and 10 cents is charged for half of a fair-sized one. It is needless to say that none but those of good quality can be used satisfactorily for this purpose.

W. W. H.

THE output of coal from this country for the year 1900 was the largest on record, being 267,540,000 tons. This was five per cent more than the previous year, and 15,000,000 tons above Great Britain's greatest record.

A COMPANY has been incorporated at Albany, N. Y., for the manufacture of machines to polish shoes by electricity. This would do away with much hard hand labor, but it is doubtful whether it will supplant the old-fashioned, elbow-grease method, for some time at least.

PAN-AMERICAN EXPOSITION NOTES.

The Mines Building was one of the very first to have its exhibits completed and ready for visitors. It is connected with the Horticulture Building by one of the conservatories. Not all of the mineral exhibits are found in this building, as several of the Central and South American republics have separate buildings in which a large part of their exhibits of different kinds are placed; hence the Mines Building proper contains only the displays from the United States and Canada. Among the most interesting of these exhibits is a collection of precious stones in the rough and cut into jewels ready for setting. It might be interesting to many readers to mention some of these gems in a descriptive way, and, while I make no pretensions to being a mineralogist, the information I may give is upon good authority.

The diamond, of course, is the most valuable of all gems, and is a crystal which was formed, so mineralogists suppose, under the most intense heat in the natural fires of by-gone ages. A perfectly pure diamond is clear white or translucent, and without any coloring whatever except the prismatic colors which come from the reflection of the sun's rays; but there are various colors found among the diamonds, some of them being blue, green and also of a yellowish tint, which colors come from certain foreign substances that were incorporated at the time of the formation of the crystals. These may be seen in the collection of both cut and uncut stones, and in the Manufactures Building diamond cutters are at work cutting the rough stones into finished diamonds. Of the cheaper and more common gems, silica is the basis of about all of them. This is the principal ingredient of our common glass, and is found in the earth in large quantities mixed in with rocks and other earthy matter. Aluminum is another of the principal ingredients of these stones. As most of us now know, it is mixed with some other metals and forms an alloy which is worked into many kinds of cooking utensils and various articles of common use. It is very light, weighing only about the same as ordinary oak wood. In several glass cases in the Mines Building visitors will notice large blocks of mineral which are crusted with pointed or pyramidal stones of a pinkish tint. These are amethysts, and when cut into proper shape for setting they have a very brilliant lustre and are highly prized. This coloring comes from a mixture of oxide of iron and manganese, and the varying colors which are from light pink to dark purple are owing to the different proportions of these oxides. The more manganese the darker is the color. The emerald gets its beautiful green color from small particles of glucina, which is another metallic substance, but the most beautiful of the green gems is the hiddenite, which gets its color from chromium. The topaz, which is a very common gem, varies in color from yellow in different shades to a dark smoky or almost black color which is from a slight mixture of fluorine. The garnet gets its rich red coloring from iron, aluminum and chromium, the shades varying according to their different proportions. We have all admired the beautiful blue turquoise stones which are used so much in jewelry, and it may be a surprise to some to know that they are simply composed of phosphate of aluminum colored by copper. Sometimes the turquoise shades into a green, although this is rare. Opals, which vary from a translucent milky color through yellow, blue, green and red, are mixed and intermingled sometimes in the most charming way, and yet these colors all come from these metallic oxides that I have just mentioned in describing the other gems, imbedded in silica and with a little water added. It may seem strange that water is found in these charming stones; but such is the case, and sometimes there is as much a five per cent of it. By heating the water can be driven off and the colors of the opal materially lessened in brilliancy.

One large case is devoted entirely to the natural carbonates of copper, and there is no exhibit in the mineral building which is more striking or beautiful to look at. There are pieces of malachite, which are green in color, and look almost like frozen bubbles of the most beautiful tints and shades. A slight additional proportion of copper makes azurite, which is blue and exceedingly brilliant, almost like indigo in richness. These formations are found about the copper mines, especially in Arizona, Montana and Michigan. Nature has sometimes deposited the malachite formation and then a layer of azurite, one over the other, and when these layers are cut or ground down they make lovely settings for pins and other jewelry. There is an asbestos exhibit, which shows everything from the crude material to the finished product. It might almost be called mineral hair, wool, cotton, or something of that kind, because it can be ground up or beaten into a fiber which can be spun or woven. As it is indestructible by fire it makes excellent fire-proof clothing for firemen and for covering steam boilers and pipes and many other such uses. The natural substance is a mixture of silica, magnesia and alumina.

In the Ontario exhibit is a fine display of graphite, there being blocks of it fully three feet square in its natural condition. This is the material from which lead pencils are made. We also use it in stove polish, little thinking that when we are using lead pencils and stove blacking, we are, perhaps, drawing upon the same mine for our material. A whole day might well be spent in this Mines Building, but I only mention these few things to give our readers a glimpse of what there is there to see, and I hope they will not fail to go there and learn many things that will be at once useful and entertaining. A farmer needs to know something besides how to cultivate corn and grow good fruit. In fact, he ought to be an all-'round man.

There is one thing which I wish to suggest further to those who may visit the Exposition, and that is, that if possible at all, they do not fail to stay during the evening as late as nine o'clock at least, in order to see the illumination. I have mentioned the electric lighting before, but I will venture to say further that the lighting of the buildings and grounds is, perhaps, the most remarkable feature of the entire exhibition. One should take a position somewhere in the large open space which is called the Esplanade, about eight o'clock, and while listening to the music, wait for the lights to be turned on. This is first a very slight glow as the band begins to play the "Star Spangled Banner," and this increases in power, but very gradually, indeed, until the whole scene is a perfect glory of light with the Electric Tower as the central figure. This scene will be remembered as long as one lives and is worth a long trip to behold.

H. E. VAN DEMAN.

CROP PROSPECTS.

JULY 8.—About half of the apple orchards will have full crop. We are 40 miles north of Pittsburg. I have heard that the apple crop is better south of us. The corn is likely to make as good a crop as last year; the last 20 days have been favorable. Potato acreage is more than double last year within a mile of where I live. Potato bugs are very plentiful this year; last year there were no bugs. Wheat better than usual; rye not so good; oats better stand than last year. Meadows fairly good.

H. O.

Portersville, Pa.

JULY 8.—There is no wheat sown here. The crops are corn, oats, some rye, hay and milk. My own crops are late potatoes for retailing here in Crown Point, and seven acres of asparagus for shipping to Chicago. I have been raising Lima beans, but think this Summer's crop of beans will be the last. They do not pay, and it is difficult to get poles here. We expected to have eight acres of cow peas this Summer, but the beet sugar folks came in and persuaded us to sow beets instead of peas. We had two acres of Crimson clover that stood the Winter fairly well, but it does not seem to start up again since cutting. I don't think we will bother with it again; cow peas and rye for Winter cover are more satisfactory.

L. C. B.

Crown Point, Ind.

JULY 8.—In general among farmers within a radius of from five to eight miles from Progress the apple crop will be poor. Smokehouse seems to be about the only variety that gives promise of a fair crop. Baldwins hang very thin on the trees and other late varieties are but little better. Early potatoes that were planted in time to mature before the dry spell, which began about three weeks ago, are a fairly good crop. Present prospects for late potatoes are very poor indeed. The excessive heat of the past two weeks has caused even the quite late potatoes to begin to die before the potatoes have had chance to form. The crop of field corn is not yet seriously injured by the heat and dry weather, but the crop will depend largely upon the rainfall of the next week or two. Early sweet corn is already suffering, and an extremely light crop is feared. Hay and wheat are ordinary crops in our vicinity. The heat and dry weather are interfering sadly with the setting out of late vegetables, such as cabbage, tomatoes, celery, etc. Our salvation for late crops depends upon a speedy rain, the indications of which are very scanty at present.

Progress, Pa. J. G.

JULY 9.—Apples will be about one-half crop. Some orchards, where the trees are set close together blossomed freely, but set scarcely any fruit. Corn was finished planting June 6 and is looking well, considering the length of time planted, but cool weather and rains are retarding its growth. Potatoes are looking fine but are beginning to show signs of blight. Hay will be a big crop. Oats are yellow with rust, and are beginning to head. Too many rains of late have hurt most crops except buckwheat, which is fairly jumping.

Carter Camp, Pa. O. S.

The Bridal Feast

Is not infrequently followed by a long, lenten period of enforced fasting and fleshly mortification. The cheek grows hollow, the eyes are dull and deep ringed, and the step is slow and languid. There is an "all dragged-out feeling," which makes life an utter burden. The great functional changes which follow marriage are not usually anticipated, or the wifely suffering might be avoided.

Dr. Pierce's Favorite Prescription is the best friend of weak and sickly women. It cures the womanly diseases that rob the eye of brightness and the step of lightness. It tones up the system and establishes the womanly organism on a basis of sound health.

"Favorite Prescription" contains no alcohol, neither opium, cocaine, nor other narcotics. Accept no substitute. There is no other medicine "just as good" for weak and sickly women.

"I had been a great sufferer from female weakness for about two years," writes Mrs. Emma Richardson, of Goss, Wayne Co., Ky. "Could not do my work part of the time. I took four bottles of Dr. Pierce's Favorite Prescription and felt as well as I ever did."

Young married women will find a lasting friend in Dr. Pierce's Medical Adviser. It contains 1008 pages and is sent *free* (in paper cover), on receipt of 21 one-cent stamps to pay expense of mailing only. Cloth binding, 31 stamps. Address Dr. R. V. Pierce, Buffalo, N. Y.

MIXED WIRE NAILS

Gold-Shell Rings.

Most people like a nice ring. We show three styles. These are made by drawing a shell of gold over a rod of composition metal. They are better and will wear longer than solid gold rings of a low carat. The retail price would be from 75 cents to $1. We will send one of these rings postpaid as a reward for sending one new subscription at $1. Cut a slip of paper the size of finger and send for size.

Live Stock and Dairy

HOW TO MAKE BUTTER.

I am making butter from two cows, and use a separator into which equal parts of milk and water are poured. We use a barrel churn. How should I keep the cream in the cellar? (No ice). If so, should it be brought to warm place to ripen this time of year? How long before churning should this be done, if at all? Is it necessary to add sour cream at this season? How am I to know when it is "ripe?" What temperature should it be before churning? How long ought it to take to churn? When butter comes, but will not gather, I have put in soda and it separated at once. What was wrong with it, anyway?

Buttermaking is an art, and the butter maker has to deal with so many different conditions that it is not easy to set down exact rules or temperatures. The following notes by one who has made butter in farmhouse, dairy and creamery may, however, be helpful. They are written with those in mind who keep a few cows and make up their own product, rather than the creameryman who handles the milk from many farms:

FEEDING.—The problem of making good butter begins with the feeding and care of the cows, but this is in itself such a broad subject that it can hardly be treated here. Suffice it to say that the food and water should be pure and wholesome, the food free from molds and taints, and that plants with a strong odor as onions, wild garlic, or noxious weeds should be kept out of reach of milch cows. Cows should be fed regularly.

MILKING.—Cows should be milked regularly in a clean stable, with clean hands, into a clean pail. Brush the udders, bellies, and flanks of the cows before the pails are brought to the stable. The milker should have a suit of overalls to be worn only at milking time, and they should be clean and free from dust. It is at this time that the greatest contamination of the milk occurs, and such troubles as gassy curds and tainted butter have their origin. You cannot be too particular as to cleanliness at this point.

SEPARATION OF CREAM.—If you can afford a centrifugal separator, it is undoubtedly the best and most economical way to get the butter fat out of the milk. It certainly skims cleaner, 365 days in the year, than any other method, and gives sweet skim-milk for feeding to farm animals. As to the kind of separator to buy—get the one that you think will be the easiest to keep clean, and with it require a written guarantee that the machine will skim to one-tenth of one per cent. That is, there shall be no more than that amount of fat left in the skim-milk. Next in order of excellence to the centrifugal separator, come the various deep-setting systems, Cooley, Stoddard, etc. If a plentiful supply of cold running spring water is available the deep setting system will give very good results. In the absence of running cold water, ice may be used, but this increases the labor considerably. Nevertheless, of the deep-setting creamers in use, there are probably not 10 per cent supplied with water cool enough so that ice can be dispensed with through the Summer months. If the milk, as soon as drawn, is cooled to 40 degrees and kept at that temperature for 24 hours, not more than two-tenths of one per cent of fat will ordinarily be left in the skimmed milk by the deep-setting systems. Other means of separation are the dilution separators, so called, and the old-fashioned shallow pans. The name separator, applied to a can in which milk may be diluted, is a misnomer, and should be discountenanced by all intelligent dairymen. The practice of diluting milk ostensibly to reduce the viscosity of the milk serum, and thus help the fat, which is the lightest constituent, to rise to the surface, is of doubtful utility. The matter is concisely stated in the following quotation from Bulletin 151 of the Cornell University Agricultural Experiment Station:

"Combining the results of this Station with the results at the Vermont Station, we have the following average percentages of fat in the skimmed milk under the different systems: Diluted, set at 60 degrees (39 trials), .77 per cent; undiluted, set at 60 degrees (30 trials), 1.00 per cent; undiluted, set at 40 degrees (26 trials), .29 per cent. It would seem therefore, that while when milk is set at 60 degrees or thereabouts, there is considerable advantage, so far as the efficiency of creaming is concerned, in diluting it with 25 per cent of warm water, this dilution cannot be regarded as a substitute for setting without dilution in ice water, and it has the further disadvantage of requiring increased tank capacity, and producing a rapidly souring cream. It might be added that the diluted skim-milk is very materially lessened in value for feeding purposes." The shallow pan system is, in the opinion of all practical dairymen, obsolete. For best results a uniform temperature of 60 degrees should be maintained, and the surroundings should be clean, sweet, and free from odors or taints, as of vegetables or human foods. This precaution applies to all systems and methods of handling milk and cream.

CARE OF CREAM.—The cream should be kept in a cool clean place at a temperature below 50 degrees. This retards the action of the lactic acid germs until enough cream for churning has been collected. As each additional skimming is added to the cream pail the whole should be well stirred. This is in order that the whole mass may be kept as uniform as possible. Cream should not be kept more than three days before churning. From 12 to 24 hours before churning, the cream should be brought to a temperature between 60 and 70 degrees, the time and temperature both depending upon the time of year and the conditions under which the cream has been kept. This gives favorable conditions for the formation of lactic acid, upon which a good deal of the flavor of butter depends. In small dairies it is seldom necessary to add a starter, but if for any reason the cream does not sour readily the lactic acid germ may be supplied by adding a little buttermilk or cream from previous churnings, a little sour skim-milk, or one of the artificial starters as Hansen's or Douglas's lactic ferment. The cream should be thoroughly stirred several times during the ripening process. This is to insure a uniform degree of ripeness of the whole mass. It will be readily understood that if there are clots or portions of the cream not as ripe as most of it, these portions will not churn as quickly as the rest, and consequently will remain as cream and be drawn off with the buttermilk and lost. Or if some portions of the mass are too acid, the casein may be so firmly coagulated that it will not pass off in the buttermilk, but will be found as little white specks in the finished product, and making an excellent place for the germination of putrefactive bacteria which cause rancidity. The smooth velvety appearance of well-ripened cream is not easily described, but once learned will not be forgotten. Until thoroughly familiar with the work the amount of acid or sourness may be determined by the use of Farrington's alkaline tablets. The acidity or sourness of the ripened cream should not exceed .58 per cent as indicated by the use of these tablets. They are not expensive, and may be obtained, with directions for their use, from any dealer in creamery supplies. In order to make butter of firm solid texture, that will as we say "stand up" in warm weather, it seems to be essential that at some time before the ripening process is completed, the cream shall have been subjected to a temperature below 50 degrees for at least six or eight hours. In the deep setting systems this has already been accomplished when the cream is skimmed, but in the centrifugal and shallow-pan systems of creaming this fact needs to be remembered.

CHURNING.—Box or barrel churns without inside fixings are the best. In churns in which the agitation is brought about by means of paddles, the grain of the first particles of butter formed is very likely to be spoiled, and the finished product injured to that extent. The box or barrel churn should be rotated, so as to obtain the maximum amount of concussion of the particles of cream upon one another, and not fast enough to cause the cream to take up the same rotary motion as the churn itself. That is, it should dash from end to end at each rotation of the churn. Churn at least twice a week, and better three or more times. No exact temperature can be given at which to churn. The cream should be churned at such a temperature that the butter will "break" or "come" in from 35 to 45 minutes. Churning should be continued until the buttermilk has a thin bluish appearance; this should occur, however, while the butter is still in the granular form.

WASHING AND WORKING.—After drawing off the buttermilk wash twice, or until the wash water runs off clear. Then work in salt to suit the taste of your trade, and set away for three or four hours. Then rework and pack or stamp. The interval between salting and stamping allows the salt thoroughly to permeate the whole mass, and the second working also insures a uniform mixing of the salt as well as working out any excess of water. Never work butter when it is warm enough to be salvy. There are two watchwords for the buttermaker, they are *cleanliness* and *uniformity*, and are worth remembering if you are looking for trade and reputation.

The action of several common alkalies upon cream was studied by Soxhlet, a German investigator, some years ago, but is not, even now, thoroughly understood. We say that they decrease viscosity and thus aid the separation of the butter fat from the casein. It is quite likely that a handful of salt would have given the same results. Your cream was probably not properly ripened.

DR. JOS. HAAS' HOG REMEDY
Is Guaranteed to prevent and arrest disease, stop cough, expel worms. Increase appetite and growth.
Send $1.25 for trial package, postage paid. Cans $12.50 and $6.50; packages $2.50. State number, age, condition, food of hogs. *Special advice free.* 25 years experience. "Hogology" pamphlet and testimonials free.
JOS. HAAS, V. S., Indianapolis, Ind.

Death to Lice on Hens and Chicks. 64-page Book FREE.
D. J. LAMBERT, Box 307, Apponaug, R. I.

ZENOLEUM Kills Lice, Ticks, Mites, Fleas, Etc., on all kinds of animals and poultry. Given internally it drives out worms. Cures all cuts, wounds, sores, etc Non-poisonous. Endorsed by leading veterinarians. "Veterinary Adviser" free. Zenner Disinfectant Co. 100 Bates St. Detroit, Mich.

Dead Flies! Dead Lice! EUREKA FLY KILLER
does the work on stock and poultry. We warrant it. Best agr'l authorities in U. S. endorse it. Can you ask more? Rapid seller. Big profit. Sure success. 1,000 live agents wanted. Write for prices, Exc territory given. The J. H. Ames Co., Bowdoinham, Me.

ORR'S FLY KILLER IS THE BEST
Kills Flies and Lice on Cattle and Horses.
Gives Cows Comfort, hence more milk.
Keeps Flies off Horses, hence more work.
Purifies the Stable, hence health and safety
One gallon can $1, and Keystone Sprayer $1, both sent express prepaid for $1.50, to introduce it. Five-gallon can, freight prepaid, $4.00.
T. E. ORR, 563 Liberty Street, Pittsburgh, Pa.

THE FULL MILK PAIL
attests the value and is the sure result of the use of our
NEW CENTURY FLY KILLER OIL.
There is no "fly time" where it is used. Absolutely safe—harms neither man nor beast and will not taint milk. It is most evenly and cheaply applied with our Special Sprayer. Calves and young stock can't thrive and grow if continually fighting flies. It's equally valuable for horses. Prevents "fly nervousness" and has saved many a "run off" and "smash-up." Ask your dealer for it. If not there, send $1.00 to us for Sprayer and enough Killer to protect 250 cows or other animals. We are the sole manufacturers and want agents everywhere.
D. B. SMITH & CO., UTICA, N. Y.

OUTWITTING A COW.

How to Make a Nice Cow of Julia.

I have read a whole lot of ways to keep a cow from kicking, but I can tell the Hope Farm man how to make a nice gentle cow of Julia. Put her in stanchions or tie her short and, if tied, put a pole beside her as high as her flank, to keep her from turning around on to you. Get a few sticks like the butt of a cart whip, about four feet long, and lay them carefully within reach. Take one of them and tickle Julia's leg with it. When she resents this familiarity and kicks, let the stick come back on her leg below the hock sharply. If Julia is as brainy a cow as we hear of, and as high-tempered, she will lose her temper at the first sharp blow, and the fun will begin. Don't lose your temper; keep cool, but let the stick go back sharply on the leg every time she kicks. If she is a quitter, or foxy, she may, from motives of policy, stop kicking before she is cured, in which case it will be necessary to take along the sticks and lay them down where she can see them when you go to milk, and, as she will now know just what it means if she does kick, make her promise not to do so any more. When a cow bellows it is her signal that she will be good, and a cow rarely breaks her promise. The Hope Farm man may think Julia will get mad and hold up her milk, or do some other ornery thing, but there is no danger. When Julia says she will be good, she will not chase the children or do any other of the many things a bright cow can think of while she considers herself the boss.

I trust none of your readers will think I spend my time pounding cows. I allow a calf to kick at me till it is three days old. After that, if it is to be raised, I quietly teach it that kicking is naughty. During the first Winter, while I am the biggest, the little ones are all tied long enough to get them used to it, and I go around them, smooth them, pat them, and get them accustomed to being handled. Most of my cows, all born on the place, were never struck a blow in their lives, but if a youngster shows a disposition to kick it is stopped at once. We use oxen on the farm for part of the work, buying them as steers "broken." I don't remember of having bought more than three pairs in 40 years that had not some mean trick. Sometimes I had to think awhile, but never failed of curing in one lesson, and think I was never more than half an hour giving that lesson. Man is no match in brute strength for a full-grown cow, ox or horse, but unless he can outwit any of these he ought to study for a profession and not try to be a farmer.

Connecticut. R. S. HINMAN.

CONGRESSMAN WADSWORTH AND THE GROUT BILL.

I noticed a letter on page 440 from M. J. U., and your comments. It seems to me, in view of the fact that Mr. Wadsworth was returned to Congress last year by an increased majority, after all the abuse heaped upon him by you and others, that you would begin to think you were cutting very little ice. Mr. Wadsworth is known personally by a large portion of his constituents (of whom I am proud to say I am one) and they all know him to be a man who never could be influenced by the oleo crowd to do what he thought was not right, neither will he be influenced by the anti crowd to do it, either. And he is thought far more of by men who favor the Grout bill for standing up like a man in opposition than if he gave it a half-hearted support like some. You must know that his return from a strictly agricultural district, honestly and heartily indorsed, will be likely to go much further with Speaker Henderson than all the letters from York State men who ask who this man Wadsworth is, and who appoints him. You may print this letter if you wish and abuse me as much as you like, as I am a working farmer and interested in the cow, and am seeking no political favors of Mr. Wadsworth or anyone else. But please let up on him a little, although he can stand it. He feels, with his friends, that it is entirely uncalled for. R. J. RAY.

Livingston Co., N. Y.

R. N.-Y.—Mr. Wadsworth represents the Thirtieth District of New York State, which includes the counties of Niagara, Livingston, Wyoming, Genesee and Orleans. Last year his majority over the Democratic candidate was 8,172. True, this was larger than the majority of two years before, but it was in a Presidential year. It was a smaller majority than Mr. Wadsworth received in 1896. Last year, in these counties, McKinley's majority over Bryan was 9,418. Mr. Wadsworth therefore ran nearly 1,300 votes behind his ticket. He held his own along the canal, but lost in parts of his district where dairying or stock growing are features. The amount of "ice" we can cut in that district has little to do with the final outcome. By his opposition to the Grout bill Mr. Wadsworth has become a figure of National importance. He may be the best of neighbors and the most popular man at home, but by his course in Congress he has placed himself in opposition to thousands of farmers who will never see him or hear of him personally. There are dairymen all the way from Maine to California who thoroughly believe that if there had been a true friend of honest butter at the head of the Agricultural Committee last Winter the Grout bill would have passed both Houses of Congress and received the signature of the President. These men cannot go into Mr. Wadsworth's district and vote against him, but they can go up higher and protest against his reappointment. We seldom have an issue made so clear and plain as this one is. Mr. Wadsworth says openly that he is opposed to the vital principle of the Grout bill. There is no use attempting to convert him—if he be reappointed chairman of that committee we all know that he will do his best to hold up the bill a second time. That being the case the farmers of this country who desire the legislation suggested in the Grout bill have a perfect right to demand that some man more favorable to their interests be put on guard. In fact, the only thing they can do is to bring the strongest possible pressure to bear upon Speaker Henderson, and to their credit be it said that they are coming into the fight by the thousand!

Clean the Milk Cans.

The milk producers can have no quarrel with the city consumers. These two classes should be on the most friendly terms, for their interests lie close together. The consumer needs education regarding New York's milk supply, and he is getting it rapidly. Just now there is a discussion in the daily papers over clean milk. The following letter in the Morning Journal touches a vital question:

"One phase of the matter seems to have been overlooked—viz., the horribly filthy condition in which some of the milk cans are returned from the city. These empty cans stand around, and before they get back to the country the milk is thoroughly dried on to the sides and in the corners of the can. It is about impossible thoroughly to wash such cans with the facilities within reach of most farmers. Live steam is the only stuff that will do this job as it ought to be done, and the time to do it is before the milk gets dried on. Laws compelling city milk receivers to turn a jet of live steam into every can before returning it would be a material help in securing clean milk, and would work no greater hardship on milk receivers here than many other laws that are enforced in the interest of pure food. Connection with live steam might be had without great expense at most of the receiving stations.

"Another wrong is the putting of garbage into milk cans. I have seen cans received from this city, standing on the platform at country milk stations, containing quantities of pumpkin pie and other restaurant refuse in such a state of decomposition that a self-respecting hog might well decline to have anything to do with it. Our scientific friends who are chasing up microbes with microscopes will find a good field for investigation in the average milk can as it is returned to the farmer."

Pigs in a Peach Orchard.

J. S. Woodward told us in THE R. N.-Y. some time past, how he pastures his hogs in an orchard. My hogs and pigs chew the bark off the young peach and plum trees, unless protected. Would you advise sowing a five-year-old peach orchard to grass and clover, for a hog pasture? The land is rich and good; trees large and in bearing. They would make fine shade. Other land is not available for the purpose. For Summer I have a field of rape.

Jackson, Mich. P. E. L.

From the pig standpoint, the idea is a most excellent one. There is no question but what the pigs will be greatly benefited by the shade of the orchard, while if it is in bearing they will clean up undesirable peaches that drop to the ground, and so assist in reducing insect pests, decayed peaches or sprouts which might follow volunteer seeding. I know of no experiments that have been conducted to determine the value of pigs thus pastured, only it is well established that clover is a superior Summer pasture for pigs, and if in a shaded lot, so much the better. From the orchard standpoint I do not think the pasturing the best thing. The best orchards that I have seen are cultivated over. Still, if the orchard is a year or so in clover, and the stubble is then plowed under, the trees should be much benefited.

In regard to the pigs gnawing the bark, this need not necessarily always follow. With plenty of good food I should not expect the bark injured, but some pigs occasionally develop rather abnormal appetites, in which event they may bark the trees. Personally, I should protect the trees, if the necessity arose, by placing about them for a height of two feet up from the ground, a one-layer band of tin or wire, bent about the tree snugly, yet not fastened together to prevent the expansion of the tree trunk. Such a protection need not be very costly, in view of the fact that second-hand tin or wire will do very well for this purpose. C. S. PLUMB.

KICKING COWS.—I must tell you our remedy for kicking cows. We keep a herd of 19 milch cows, and have used this remedy very satisfactorily for 10 years. It consists of a strap made from harness leather, this strap to be 40 inches long, 1¼ inch wide with a buckle sewn on the end. About 2½ inches from the buckle is another buckle (minus the tongue), riveted on the strap with a piece of leather and two copper rivets. At the other end of strap the last 10 inches have holes made every inch and a half or so to buckle into. Put this strap around Julia's left hind leg just above gambrel joint, put end through the false buckle and draw up tight, then put it around right hind leg the same, and now through buckle. Draw up tight and buckle, which fastens legs securely together, and if they try to kick they will throw themselves, but they usually give up. E. M.

Kendall's Spavin Cure

is the only horse remedy that has stood out with special prominence all these years. Cures Spavins, Ringbones, Splints, Curbs and all Lameness. $1. a bottle; 6 for $5. All druggists. Unequaled for family use. Book "A Treatise on the Horse" sent free. Address Dr. B. J. Kendall Co. Enosburg Falls, Vt.

Shoo-Fly THE ANIMALS' FRIEND

Kills every fly it strikes. Keeps off the rest. Harmless to man or beast.

This cow was a *terror* to milk prior to using ½ cents worth **Shoo-Fly**. Had it been used earlier she would not have lost milk and flesh to the amount of $14. The other cow was protected early and continued to give 18 qts. daily through fly time. Thousands have duplicated 10 gallons seven consecutive years. If your dealer does not keep it, send us $1.00 for latest improved double tube sprayer and enough **Shoo-Fly** to protect 100 cows, or send 25c for liquid. Cash returned if cows are not protected.

SHOO-FLY MFG. CO., 1005 Fairmount Ave., Phila. Pa.

Rippley's Fly Remover

instantly removes all flies, mosquitoes, lice and other insects from cattle, horses and other animals sprayed with it. It is healing to any sore. Animals rest easy and feed quietly all day. Cows give ¼ more milk, which is a big saving. 1 gal. will protect 500 cows. Money refunded if animals are not protected. Indorsed by the best class of people. Order at once and secure agency, you can sell hundreds of gallons. 1 gal. $1.10, 2 gal. $2.10, 5 gal. $4.50, 10 gal. $9.00. **Rippley's Special Sprayer** to apply same, $1. **5 gal. Compressed Air Sprayer** to apply same on large herds, $6.25. Address,

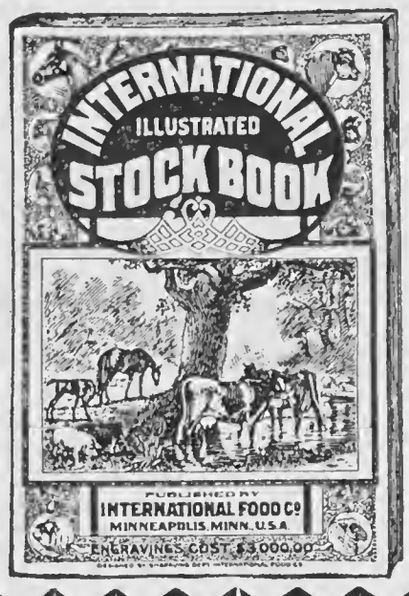
A $3000 STOCK BOOK FREE



We Will Mail You a Copy Free, Postage Prepaid, if You Answer 3 Questions:
1st.—Did you ever use "International Stock Food" for Horses, Cattle, Sheep, Hogs, Colts, Calves, Lambs or Pigs? 2d.—How many head do you own? 3d.—Name this paper.

THIS BOOK CONTAINS 183 FINE, LARGE, COLORED ENGRAVINGS OF HORSES, CATTLE, SHEEP, HOGS, POULTRY, ETC.

DESCRIPTION: THE ENGRAVINGS COST US OVER $3000 and were made by our own artists. The book is 9½x6½ ins. and the cover is a beautiful live stock picture printed in 6 brilliant colors. In Horse Department are fine engravings of Imported Messenger, Mambrino, Abdallah, Rysdyks' Hambletonian, Nutwood, 2:18¾; Robert J., 2:01½; Directum, 2:05¼; Nancy Hanks, 2:04; Star Pointer, 1:59¼; Johnson, 2:06¾; George Wilkes, 2:22; Alix, 2:03¾, and many others. It contains 20 large engravings of draft and coach breeds. In Cattle Department are large engravings of the leading prize winners, of the different breeds, at the Trans-Mississippi Exposition. Also the Largest Cow in the world, weighing 2970 lbs. and 6 feet tall. In Hog Department are engravings of the different breeds and the latest scientific facts in regard to Hog Cholera. Also the Largest Hog in the world, weighing 1621 lbs. In Sheep Department are extra good engravings of the prize winners, of the different breeds, at Trans-Mississippi Exposition. In Poultry Department are engravings of the different breeds. Your special attention is called to the fact that the book also gives a description and history of the different breeds of Horses, Cattle, Sheep, Hogs and Poultry. The Veterinary Department is very practical and contains extra fine veterinary illustrations. It gives the different diseases for Horses, Cattle, Sheep, Hogs and Poultry, and tells what to do for each. The Veterinary Department will be a great addition to your live stock library and will save you hundreds of dollars. You cannot buy a book for $10 that will give you as much practical information and as many fine colored engravings of noted animals.

We Will Give You $14.00 Worth of "International Stock Food" if Book is Not As Stated.

"International Stock Food" is endorsed by over 100 leading "Farm Papers" and is used and endorsed by over 500,000 stockmen and farmers, and is sold on a "spot cash guarantee" by over 20,000 dealers. Your money will always be refunded if it ever fails to make you extra profit in growing, fattening, milking, or in keeping your stock healthy. Established 12 years and has the largest sale. Included in the United States Government exhibit at Paris and won the highest award and medal at that Exposition, 1900. The editor of this paper will tell you that "International Stock Book" is one of the best illustrated books ever published. Most of the illustrations are of noted animals.

Largest Stock Food Factory in the World. Capital Paid In $300,000.00.

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2687. NEW YORK, JULY 27, 1901. $1 PER YEAR

FARMING WITH CHEMICALS AND WATER.

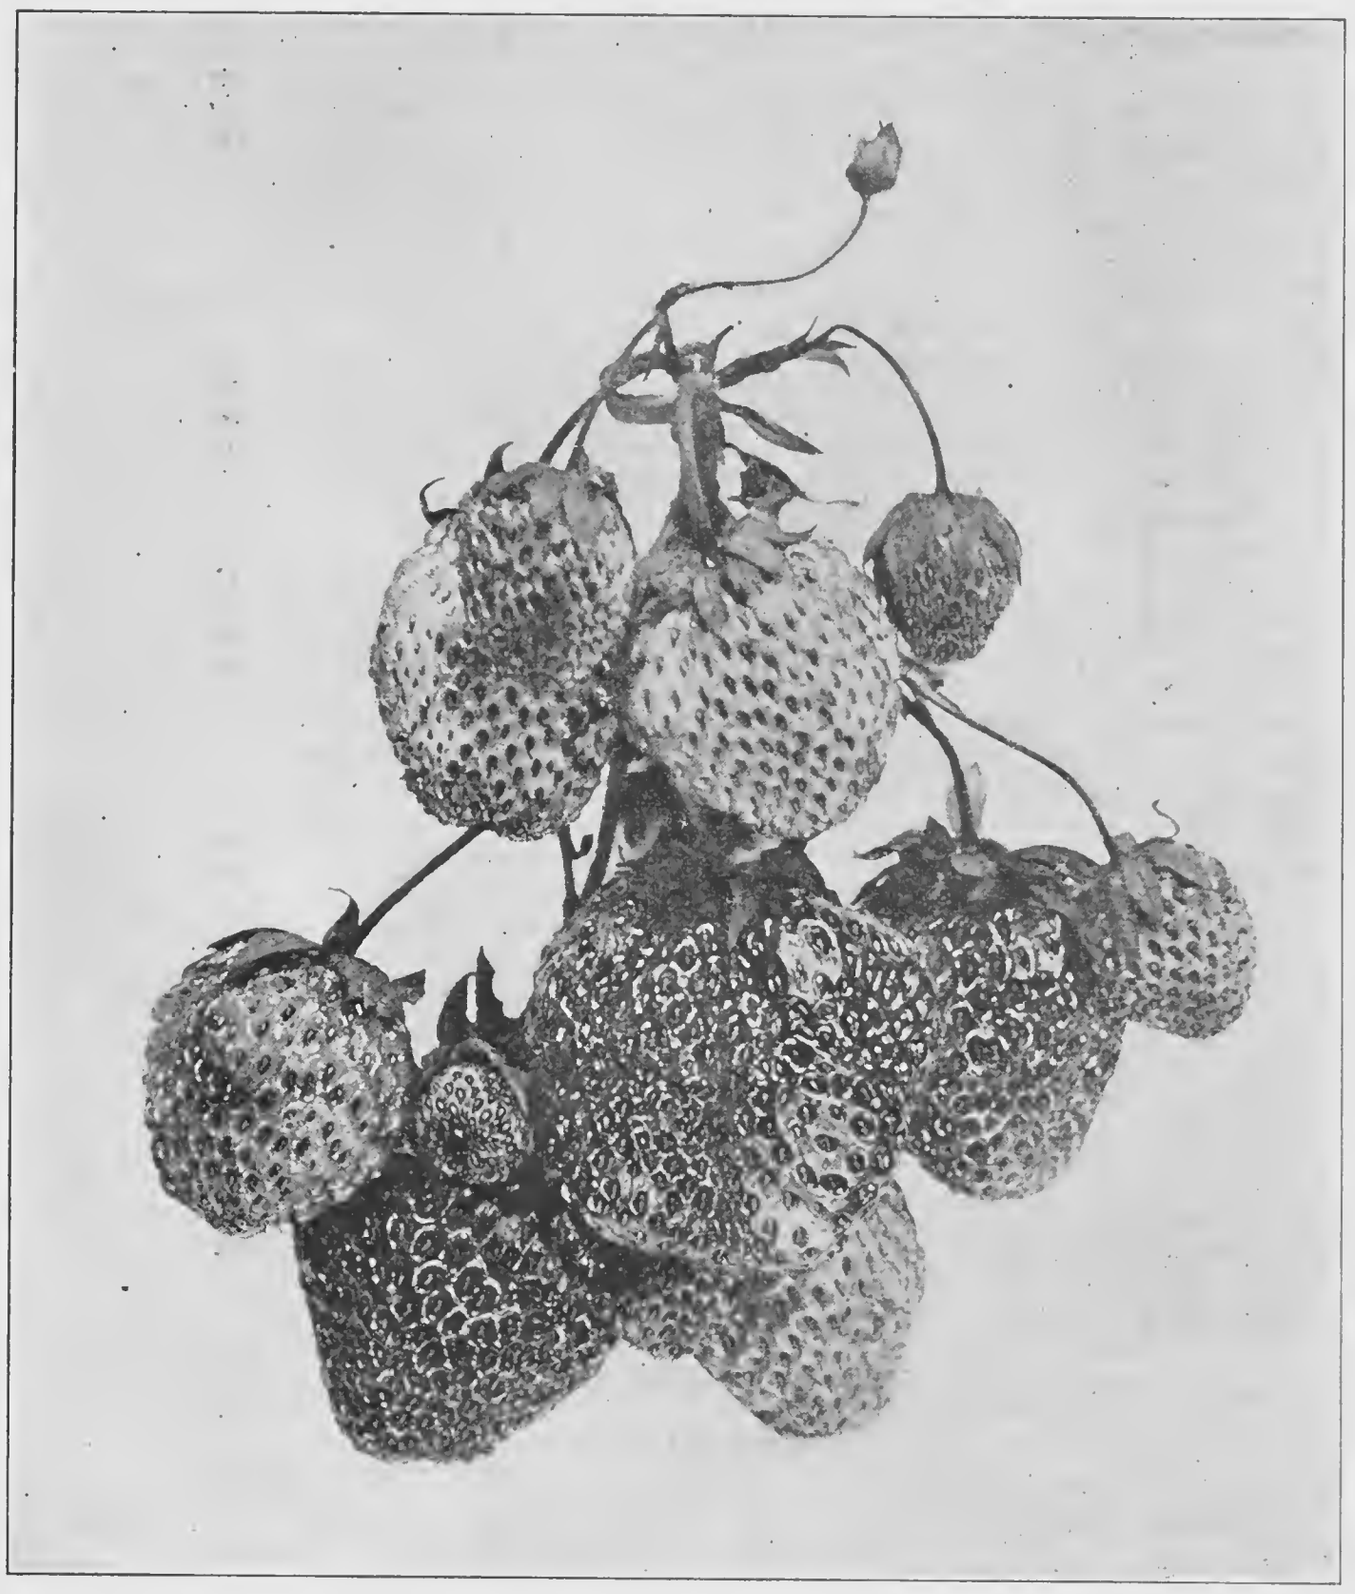
UTILIZING THE LOWER LANDS.

Good Culture for Onions and Strawberries.

On page 466 we spoke of the farm of Thomas R. Hunt, of Lambertville, N. J., whose plan of intensive farming presents a sharp contrast to that followed by D. C. Lewis. The country around Lambertville is rough and hilly, with many springs and wet places, while at Cranbury it is level and easily worked. Mr. Hunt took a poor farm—so poor that for many years it yielded no profit, and by hard work and wise planning has been able to make the farm pay well.

He may be called a fertilizer and water farmer—using the Stockbridge fertilizers and pumping water from a small pond for irrigating purposes. On a level farm like that of Mr. Lewis at Cranbury a well-ordered rotation of a few staple crops is possible, but on a farm like Mr. Hunt's—rough and uneven—a different plan must be followed. Such farming, to be successful, must be divided into two distinct classes. On the hills grass and grain may be grown in short rotation, or the hillsides may be planted with fruit trees. The lower lands in the valley may be smoothed and given to such crops as vegetables and small fruits. Mr. Hunt has followed this plan with success. There was a field of good wheat on the highest hill—"a fruit grower must have straw"—as the farmer says, and several good fields of grass. The money crops, and where they are the heart of the farm will be found, are grown on the lower lands. On this farm the money crops are onions and strawberries. These crops are grown together. The strawberry plants are set in rows five feet apart, with several rows of onions planted between. Both berries and onions receive the best of care, being well fed and thoroughly weeded. After the onions are pulled, transplants from the strawberry rows are put where the onions grew, and thus the ground is filled. This is not a new way of growing strawberries, but Mr. Hunt has been very successful with it. He also has a plan for keeping old strawberry beds in bearing which is well adapted to a piece of ground suited to this fruit. After fruiting, the middles of the matted rows are cut out. The outer plants send runners into what was this year's cultivated space, so that the heart of this year's matted row becomes the space for the next season's cultivating. Thus we have each season new plants on new ground—this year producing fruit on the ground which was under the cultivator last year.

A dam built across a little brook at the lower part of the farm has made a small pond for irrigating purposes. Mr. Hunt uses a small gasoline engine for pumping. This engine can be mounted on a truck and carried about from one part of the farm to another wherever work is required. This is not a traction engine, but a small stationary affair which is light enough to be picked up and carried from place to place. The water is run through hose and wooden troughs, the latter having little metal gates or openings through which the delivery of the water may be regulated. As we have already said, the early part of this season was so wet that he made no use at all of his irrigating plant. Still, even in this unusual season, there was a week or 10 days when the strawberries fairly curled up with the heat. Mr. Hunt says that probably his best returns from irrigation have been made on the celery crop. In some very dry seasons, when it would be impossible to start celery in the usual way, he has been able to flood the ground, and thus give the plants a fine start to carry them through. I have heard people tell great stories about the benefits of irrigation, but few of them will claim that flooding the ground is as beneficial as a warm, gentle rain. Here it has been found necessary to under-drain most of the soil that is used for irrigating. Both tile and stones have been used. Heavy soil, when flooded with water, becomes pasty and cold, unless there is ample space for drainage. Without tile or stones it would be like a flower pot with no hole in the bottom for drainage.



THE NETTIE STRAWBERRY. FIG. 217. SEE RURALISMS, PAGE 518.

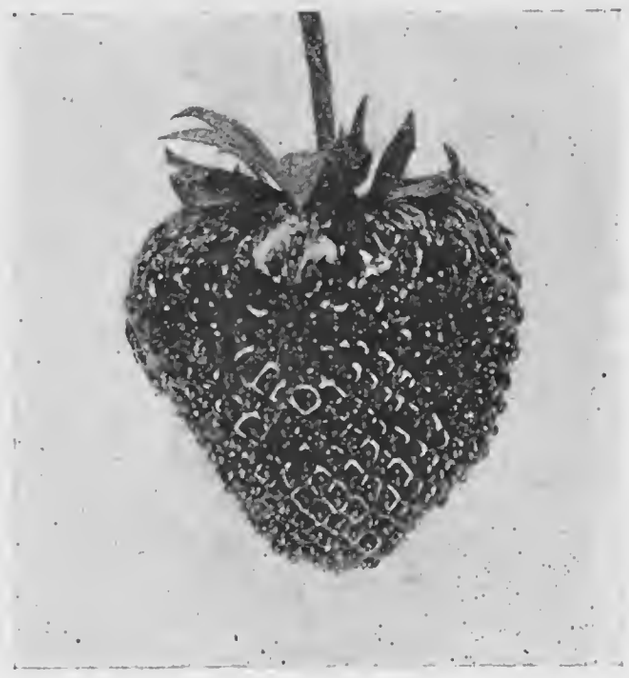
Mr. Hunt raises enormous crops of hay. He gave, on page 466, the figures of one crop of clover which I saw while being cut. He says that this grass followed onions and strawberries, without special preparation of the ground or heavy seeding. The ground was simply plowed and harrowed once. The Timothy had been blown down and smothered out, so that the crop was nearly pure clover. Had the Timothy grown I think the yield would have been fully equal to any that I have seen in Mr. Clark's fields. Yet this does not prove that Mr. Clark's system of constant and thorough tillage is not necessary. This grass of Mr. Hunt's was grown after onions and berries, both crops receiving the most careful tillage for years. All this working and handling of the soil in previous years helped the grass crop. Thus it is that the results of careful work on the soil often appear a year or two later in some subsequent crop.

The land that produces these great crops of onions, strawberries and grass was once covered with rocks and stones. The fields were like the stony old pastures one sees in riding about most hilly sections. The stones have been picked and pulled, and the fields made level and smooth for the irrigator with infinite patience. Formerly a few cows nibbled among the rocks, and the brook ran idly to the river. Now the brook has been held up and forced to do its share, and the rough fields have been smoothed and trained for the highest service of man. This sort of farming is always interesting. There is probably nothing in agriculture requiring quite so much skill as this work of giving character and value to the most unpromising parts of the farm. What a satisfaction a man like Mr. Hunt must feel to realize that he has turned these rough fields into the most productive land in the neighborhood!

To refer again to the fine new strawberry President it should be said that there are no plants for sale yet. In a recent letter the originator says:

"Three years ago, when it first fruited, the plot was probably four feet long by two feet wide, and growing in a row with a number of other seedlings. It was moved and distributed along 15 or 20 feet of row immediately after the fruiting season, and did quite well that Summer. Last Summer, after producing a fine crop, the plants were again served the same way, and had to endure the terrible heat and drought of last July and August, so that last Fall they did not look as though they could possibly produce any crop at all. Those set out last Spring are the only ones that have had a good chance, and they are doing finely, having put out a great many runners. In another fruiting season I expect them to eclipse all former efforts, and if I am disappointed I can stand it better than the public, as I am used to it. Last year, while the yield was very fine, they were not so prolific as this year."

H. W. C.



HOWARD'S SEEDLING No. 4. Fig. 218.
See Ruralisms, Page 518.

EVERYBODY'S GARDEN.

AN EXPERIMENT STATION.—Every gardener knows or should know his own needs best as to what his soil requires; the demands of his particular trade, varieties that will best satisfy those demands, etc. Then why wait for some one else to develop what will meet his requirements where the other fellow knows nothing of them, or of his surroundings? Why not, as circumstances permit, work out these problems one's self? No work in the garden will prove more satisfactory, or perhaps more profitable in the outcome than the improvement of vegetables; these improvements may become apparent in many particulars as form, size, color, quality, productiveness, early maturity, etc. These may all be brought about by careful selection of seed stock from year to year.

EARLINESS.—In nearly every variety of vegetables sown or planted there will always be discovered one or more plants with a marked degree of advanced development, which brings them to maturity several days in advance of the general crop. Carefully mark these plants, and from the very finest specimens save the seed for next year's planting. The idea prevails that plants produced from seed saved from fruits or vegetables only partially ripe, will ripen their fruits much earlier than those from seed fully ripened; this is quite noticeable in the tomato. Extended experiments clearly demonstrate this fact, but they also indicate that the extended use from year to year of this immature seed will greatly impair vitality. The restricted use of unripe seed is therefore necessary; and while helpful at first in establishing early maturity, it should be discarded as soon as the quality becomes fixed, and fully matured seed from earliest specimens be used for future work.

SIZE AND PRODUCTIVENESS.—The same general principles carried out as to size and yield will insure very desirable changes in these features. A very interesting case is cited in the Year Book of Agriculture, 1898, of seed corn of the white dent, red cob variety. Previous to harvesting the main crop, the field was carefully gone over and only short stocky stalks bearing two ears each were selected for the following year's seed. By a careful four year's selection, the yield was increased 25 per cent. The same is doubtless true of nearly all vegetables, and as to the ultimate profits in this work there is no room for doubt.

UNIFORMITY IN MATURING.—With many vegetables this is almost an indispensable quality; for example, peas grown for market where the ground is required for other crops. So few people know how properly to pick peas. Especially have we found this true with hired help, whose sole object is to get through with the job, regardless of consequences; the vines are lifted bodily out of the ground, or so loosened that they wither up with whatever peas are left. Immature pods are stripped off with the good ones, and it often happens, especially in hot, dry weather, that the first picking is practically the end of the crop. Hence the desirability of uniform maturity. For the small home garden, where it is desired to prolong the season, we should try to develop a continuous-bearing strain. In lettuce culture in the forcing house, where the profits of the work are dependent upon one crop following another in quick succession, or where the lettuce crop is followed by cucumbers, uniformity in growth and maturity is the great essential. This feature has been so carefully worked up by the growers that they are able to cut the entire crop in one day. It is almost needless to add that these gardeners are obliged to grow their own seed and can depend upon no other source of supply.

QUALITY.—Improvement in this respect is a desirable basis of experiment and can be attained in nearly all varieties of fruits and vegetables. The tomato and melon families are very susceptible to work along this line, and we also find them as ready to "run out" or become inferior, if attention to these details shall relax. To establish a particular type will involve more time and labor perhaps than some of the features above mentioned, but patience and painstaking efforts have accomplished wonders. Many striking illustrations might be given as verifying this particular thought, and later on a history of the development of some well known varieties may be of interest.

ADAPTABILITY OF THE WORK.—While the field of development in all its detail would be legitimate and feasible only for the scientist there is much that is entirely practicable for the farmer and gardener either in small or large operations. The importance of the work may be better understood when we remember that it is to these very lines of experiment we are indebted for all our best varieties of grains, fruits, flowers and vegetables.

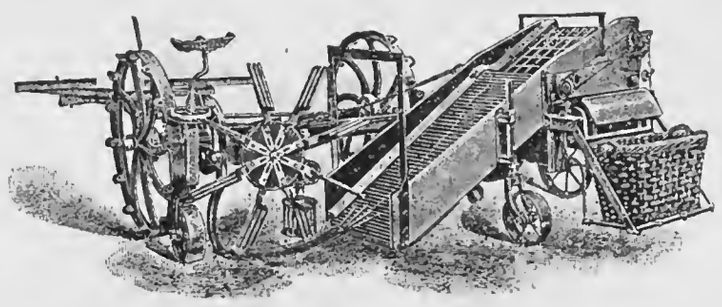
FIXED PURPOSE.—Prof. Tracy, a high authority on the subject, says: "My success in seed-breeding has always been in direct proportion to the clearness of my conception of the ideal I was striving to produce, and the persistency with which I adhered to that ideal in my annual selection of breeding stock." Get the idea of the particular point which you wish to develop clearly fixed in your mind; work for that one thing and stick to it. If other desirable features develop, use them as side issues, but work them separately; do not try to combine them with what you are already developing, as these "frills" might only appear as a passing freak, and then disappear. Work steadily for the one desired object, not allowing new features to draw you aside from the one definite plan.

Michigan. J. E. MORSE.

PASTURING THE ORCHARD.

Sheep the Apple Grower's Partners.

Since my article touching on the above subject appeared in The R. N.-Y. I have been flooded with letters asking for more definite information on the subject, and a few have been criticising me for, as they say, misleading the orchardist. Now, if there is anything which I would not do, it is to mislead any tiller



AN ENGLISH POTATO HARVESTER. Fig. 219.

of the soil. But I am very sure I am right in advising the pasturing of apple orchards with hogs and sheep. If people will only read what I write carefully, and follow my advice to the letter, I am sure they will find how to raise high-colored, fine-grained and well-flavored fruit, freest from insects, that will keep longest and in best condition, and to raise it at least expense. But they must not misunderstand me. I do not advise seeding an orchard nor keeping it in sod. Simply stop cultivating, put in the sheep, feed them and let the grass come in naturally, if it comes at all. Don't think that 10 sheep are enough for a 10-acre orchard, but put 10 or 15 sheep to the acre. overstock so heavily as to compel you to feed, and then feed enough to keep the sheep thriving and feed with a view of feeding the orchard through the sheep.

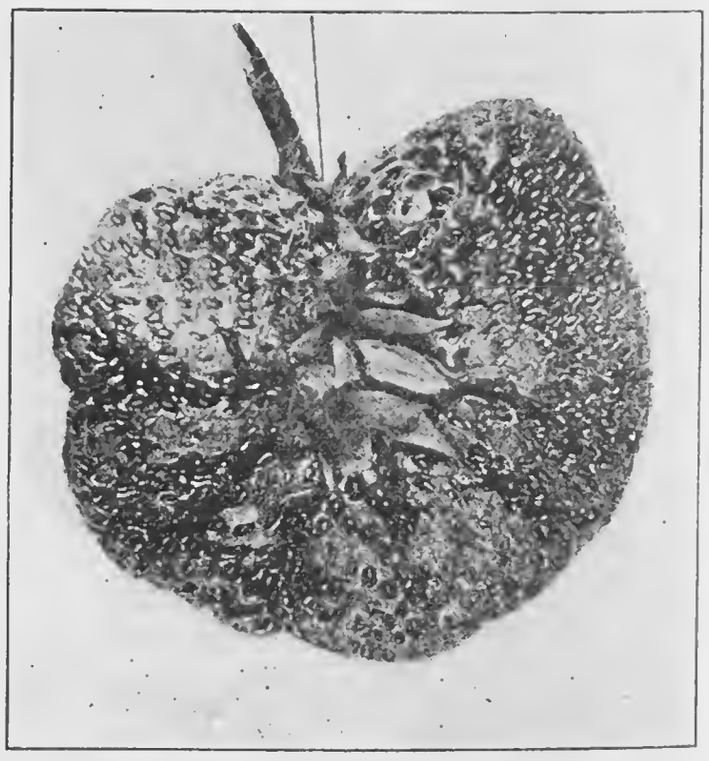
To convince himself that I am right, let any man fence off an acre of orchard and put 15 sheep into it, providing plenty of fresh clean water for them at all times, and feed them 15 pounds wheat bran a day. Keep the sheep there until the apples are fit for market, no matter if they do eat a few fallen ones, and all they can reach from the lower part of the trees; there will be just as many when it comes picking time. Just watch and see how soon the trees will take on a cloak of green color, thick and vigorous, and how hard and stocky the wood will become; how firm and highly colored the fruit will be, far beyond the part kept in constant cultivation. While this amount of bran will make the sheep thrive better than in any pasture, however good it may be, they will eat the grass to the very roots, eat all sprouts from about the roots, and take every fallen apple long before the contained Codling moth or maggot can escape, and their constant tramping under the trees will break up the surface and in a great measure conserve the moisture for the use of the trees.

If 15 sheep be kept on an acre, and they be fed 15 pounds of wheat bran a day for seven months, the length of time they may be kept in the orchard before and after the crop is picked, they will be fed 3,150 pounds of bran, which will contain 51 pounds potash, 102 pounds phosphoric acid and 83 pounds of nitrogen. If the sheep are mature very nearly all this will be scattered under the trees, which will be far more than will be taken in the largest crop of apples, and the soils will grow better instead of poorer. For the information of many who have asked how to prevent the sheep from lying all the time in some particular part of the orchard let me say that sheep are quite prone to lie about in the vicinity where fed, and by changing the location of feeding troughs once or twice a week they may be made to scatter the manure very evenly over the whole orchard. In constructing the troughs in which to feed the bran it is much better to make them with a wide flat bottom than V-shaped, as they then will not be likely to "scoop" out the feed and waste it. It is also well to make them double so that by turning over each time a clean trough will be had. The best trough will be made as follows: Use three boards eight inches wide and one inch thick, of sound timber. The only drawback to pasturing orchards with sheep is that the ordinary orchardist does not have a place in which to put his sheep at such times as he is picking his apples, and during Winter, but it will be to the advantage of every apple grower to try as indicated a part of his orchard, and I think the result will be so satisfactory that he will make an extra effort to provide some way to care for them when picking his apples, and by Winter feeding he cannot only find profitable employment for the Winter months, but make a little money and lots of manure for use in the orchards or on the farm. J. S. WOODWARD.

HORSE SHOE FARM NOTES.

CUD AND KICK.—The Hope Farm man has a peculiar faculty of looking at a subject from the off side, and makes a good point out of chewing the cud, as far as men are concerned, but that won't apply to a cow. As far as I am concerned, chewing the cud of reflection is disagreeable, and the taste bitter; with the cow it's a pleasure, a sweet morsel, and not indulged in when she is in a fighting mood, or nervous. A. L. S. is a student observing, and was right when he said: "When a cow chews her cud there is no kick in her heart." Watch her close her eyes, and chew the "grass hash"; contentment and pleasure combined are very perceptible. The perfect milker will so perform the operation of milking that this calm mood is not broken. A cow becomes accustomed to a certain milker or manner, and for best results in manners and milk should be milked the same way each time. I do not think it makes any difference whether Cook's slow uniform man or Manchester's quick, rapid milker performs the task, provided the same manner is employed every time.

ALFALFA HAY.—Many experiment plots of Alfalfa have been sown in this section, and owing to continued wet weather a complete stand has been secured. Alfalfa hay, where it has been tried, gave very satisfactory results, and the buyers tried to get more. I do not believe there will be many farmers that will *want* to sell that hay. It seems strange that the cured hay would cause bloating, and I would like to know whether there are any cases of loss known, from feeding well-cured Alfalfa hay. For best results it should be cut the first time before many blossoms appear. The late cutting of the first crop seems to injure the plant, more than at any other time. The second cutting will be smaller, and may be the only one if the plants are allowed to become mature, while early cutting invigorates the plants. The great value of Alfalfa is in the protein, and the largest per cent is found before there are many blossoms. The leaves contain three times as much protein as the stems, and the directions for saving them on page 449 are valuable. C. E. CHAPMAN.



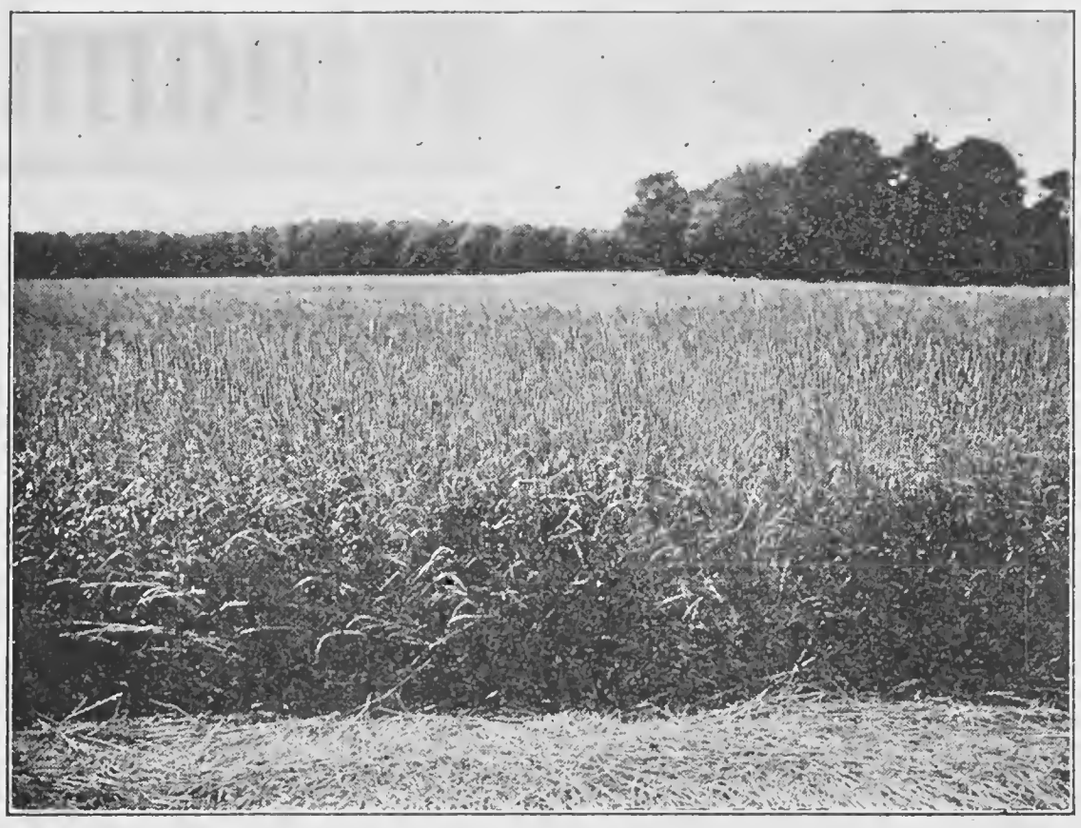
HOWARD STRAWBERRY (BLACK'S). Fig. 220.
See Ruralisms, Page 518.

FORAGE CROPS IN NEW JERSEY.

Barn Pasture for Cows.

Fig. 221 shows a picture of the grass field at the New Jersey Experiment Station. This grass was seeded alone on September 20, 1900. One object of the experiment was to observe the difference between manure and chemical fertilizers. An experiment is being conducted at the station with two kinds of manure. One is from a lot of cows which are fed what is called a "wide" ration—that is, a ration in which there is a large proportion of carbonaceous or fat and starch-producing foods. Another lot of cows is fed a "narrow" ration—that is, one in which the proportion of muscle-making foods is greater. The manure resulting from the feeding of these two rations is kept separate and tested side by side. In this grass experiment the "wide ration" manure produced 2.91 tons of hay per acre, the narrow ration 2.97 tons, and the chemical fertilizers 3.11 tons. The grass was of fine quality. This shows what can be done with a modification of the "Clark" method of seeding grass. We do not understand that the ground was worked as thoroughly as Mr. Clark advocates, and less seed was used. To those who have tried this method of seeding grass, and failed to obtain heavy yields it must be said that the soil at the station is good grass land. It has been well cropped and heavily fed for a number of years. It has been well "trained" for a big grass crop. Some of the fields on which the Clark plan was tried were not fitted by nature or by culture for the work. We must remember that great results in grass, or in any of the products of grass—man included—are possible only when natural conditions are right, or after long culture.

We have had much to say about some of the green forage crops at the New Jersey Station. Here is the order in which they have been fed this year: Rye, yield per acre, 9.60 tons; wheat, per acre, 5.23 tons; Alfalfa (first cutting) per acre, 11.14 tons; Crimson clover, per acre, 7.13 tons; mixed grasses, per acre, 8.30 tons; oats and peas, per acre, 6.20 tons. This means green food cut in the field and hauled at once to the barn for feeding. The oats and peas were partly dry when cut—thus the yield was lighter than usual. Since our last report the following crops have been planted so as to make a full succession. White flint corn, May 4; Evergreen sweet corn, May 16; cow peas and Soy beans, June 10; Barnyard millet, June 19. There will be a succession of green crops right through the season, with some of each to be cut and cured for hay.



THE GRASS FIELD AT THE NEW JERSEY EX. STATION. FIG. 221.

BLUE VITRIOL CLEANS A DRAIN.

I have a cider cellar from which led an old stone drain which has been in use for a number of years. It, however, began to run less freely than was necessary, so that last year I decided to put in a new tile drain which I thought I would flush out and keep clean, as during cider making time there is considerable thick settlings of pomace from the bottoms of the casks to be got rid of. I accordingly put in a three-inch porous tile and ran it in a new ditch most of the way. It worked all right all the Fall and Winter, although the fall was very slight where it left the cellar. This Spring we had lots of rain, and a good deal of water ran in the ditch over the tile, and when it began to clog back and fill the cellar I supposed it was due to silt working in the joints and settling where the current was checked, thus clogging the pipe, so I dug up the pipe just out from the cellar where I thought the choke might be, and much to my surprise I found it completely filled with a substance somewhat like vinegar mother. To clear it I had to take out a length of tile every 25 feet and run in a length of hose, and so finally got it clear. In about three weeks, very much to my disgust, the cellar began to fill again and I had to do something. I thought of copper sulphate, but could not see much hopes of using it successfully where there was so much water. About this time Mr. Huested, a State tree inspector, happened here, and he also suggested the blue stone, so being in a great hurry I took a handful of the vitriol crystals and put them in the end of the tile where it left the cellar, and forgot all about it until the following Monday (it was put in Saturday), when I happened to notice a lot of ropes of stuff in the brook where the drain emptied. I then thought of the vitriol and looked at the drain, and sure enough it was clear. After a time it clogged again, and I put in more vitriol. In a day or two Prof. Stewart, of Geneva Experiment Station, happened along, and I told him of my experience. He was quite interested, and expressed a wish to see the fungus and get a sample, which was easy, as it had again discharged about one-half barrel of ropes of the growth, which was at that time unknown to the Professor, but he afterward told me that it was very rare, I believe only two or three instances being noted where drains had been clogged by it. He said the name of it was Septomitus lectens. Now the question is, why did not this form in the old stone drain as well as in the tile? The other conditions were all exactly the same, except that the tile was porous and the stones not so much so. The vitriol seems an efficient and cheap remedy. I used about one-fourth pound of the crystals, which are excellent in any sort of drain or waste pipe. H. H. H.

Milton, N. Y.

PRAISE FOR THE STATION BULLETINS.

Much has been said in the last few years about the mystery surrounding the station bulletins, and much criticism has been hurled at our station officials. My own opinion is, that if the farmers were as near right as the bulletins we should not hear so much about "farming don't pay." I do not think that the bulletins should be made so plain that any farmer could read and understand them as readily as he could a daily paper; if he could he would forget their contents just as soon. Let him *study*, search out this mystery, as he calls it, and he will be able to carry its teachings into his daily work, and receive the benefit of what has cost some one perhaps years of study. I think the more I see of the New England farmer that what he lacks most is adaptability. He goes to the institute year after year, and it is very seldom that he adopts any of its teachings. He reads the bulletins, but he does not profit even by that which he *does* understand. If he is troubled in his field or orchard with insects or fungi, the station bulletin points out the remedy, and through the same channel he is taught to control, to a large extent, climatic and soil conditions. In my Grange work as lecturer of a large and prosperous Pomona Grange and Master of a Subordinate Grange, the bulletins which I receive from several stations have been a great help to me; I meet with a large number of farmers who have been benefited by the noble work that our stations are doing, and I hear but very little complaint about the station work except from new members, and those who do not belong to the Grange. Let the dissatisfied join a good working Grange, become an active working member, read the station bulletins, and he will soon become a satisfied, progressive and prosperous farmer. Long may the stations live, and all hail to the noble work which they are doing!

Massachusetts. S. R. WALKER.

A NEW POTATO HARVESTER.

For a long time those who produce large quantities of potatoes have felt the need of a machine that would do away with the hard and slow method of hand digging and picking. Fig. 219 shows the Battersby potato harvester, an implement which is used to some extent in England, and is said to work satisfactorily. This machine digs, cleans, sorts and delivers the potatoes into baskets. The separator part works on the same principle as the ordinary grain thrasher, so that those who use it may properly speak of thrashing their potato crop. There is, apparently, nothing to prevent small stones or hard lumps of dirt from getting in with the tubers, and the natural conclusion is that the machine is intended only for use on soil that is free from stones, and not wet or lumpy. It ought to work to perfection on the prairie lands of the Central West; and, if it should come into general use, the probabilities are that the bulk of the potatoes could be grown on these smooth lands on a large scale, at a figure which could not possibly be met by the small grower in the East, who must depend largely on hand labor.

VALUES OF FARM PROPERTY.

The Back Fields of Connecticut.

In regard to the two farms that I rent, years ago one of them was considered worth $10,000. At the time of the death of the owner, some 12 years ago, it was appraised at $5,500. The other farm, the party that I rent them both of, paid $5,500 cash for. He offered me this farm, after a good deal of repairing that I rent them both of paid $5,500 cash for. He them both. They contain about 300 acres. I rent them both with teams (five horses) and tools of every kind for $30 per month. There are two good houses; outbuildings need repairing; good creamery with boiler, engine and separator, and everything to make first-class butter. I own the stock, average over 50 head, from 30 to 35 cows, the rest in young cattle of my own raising. We are making now about 600 pounds of butter a month, which I send to Derby, Conn., at 22 cents for last month. It will go up now every month until I get 28 cents, where it will stand for the Winter. I used to print my butter, but now send it in tubs, the buyers paying the freight. I have to go to the depot but once a week. There are two farms adjoining these that I rent, one on the east and one on the south. About 20 years ago one of the farms was bought for $5,500, and a new barn was built. A year ago last March a young man bought it for $1,000, and in 10 months paid all his expenses promptly and $400 on the principal. He told me the other day that he could pay for it all this year, but he wanted to build a silo and repair the house, as he thought he could while owing so little. This farm contains 160 acres. The other farm was bought for $6,500 25 years ago—it contains 280 acres. A year ago last April it was sold for $1,800, and only $100 paid down. I know of three farms that were sold at auction this last Spring that did not bring much over one-third of their original cost. In Warren, a town south of us, property has decreased in value more yet. A place known all over as a very desirable one, and containing 200 acres, was sold for $600—a large well-kept house and good barns. The reason for all this, I suppose, is that, in this back country, there is little to attract the young people. They all go away to larger places. The old people, all very well off, are left alone to the mercy of hired help, and, when they pass away, the farm is sold at just what they are offered. Another thing, there used to be a great demand for charcoal, and all these old hills have been cut over several times. In every town from here to the Massachusetts line were furnaces for making charcoal pig iron, which made a good market for all the wood the farmer had, and brought a great many in town. This business is all gone and the furnaces with all their property are idle and going to decay. This iron company less than a year ago closed up the business in this district, and sold good wood land for 50 cents an acre. In regard to the markets, selling milk to the New York Coöperative Milk & Cream Company is the principal business. Some 20 years ago milk sold in New York brought from $1.20 to $1.40 per can of 40 quarts. Now they get from 50 cents to $1.15. I think last month it sold for 60 cents. This company owns creameries at nearly every station on the Housatonic road, and great quantities of milk are produced, about 200 cans (40 quarts) going from this station daily. This is a beautiful country, and nowhere is it healthier. The land is somewhat rough and rocky, but very strong and capable of producing enormous crops, and we on this place are nearly as early as some a good deal farther south. Although we had a wet Spring my corn was planted May 8, and is now six feet tall on a level.

Litchfield Co., Conn. S. M.

VANCOUVER, B. C., merchants have taken a unique plan for getting even with the dead beats in that town. They got together and made a list of all who did not pay their bills. Then they hired a collector who, dressed in scarlet uniform, called on these delinquents with demands for payment. It is said that in three months most of them had either settled up or left town.

FIGHTING SQUASH BUGS.—While sowing turnip or radish seed may or may not be of value in discouraging the real Simon Pure squash bug, the practice this year does not seem to interfere with the appetite of the firefly. The nights so far being too cool for much flying they just "lay low" and eat all night. Much of the seed was drowned out, and what came up is now being devoured. I am trying, with some promise of success, dusting with air-slaked lime or plaster, stirring in a peck of lime or plaster a tablespoonful of crude carbolic acid, and dusting lightly when the dew is on, and repeating the dose if necessary. J. Y. P.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Ripe Rot of Apples.

J. C., Lynchburg, Va.—What can I do with my apple orchard? Last year the apples specked very badly on the trees, just as they had completed their growth, so that when they were gathered in October to put away for Winter a great many of them were worthless, and this year, though the trees were full to about September, when gathering time came, there was not one to gather.

ANS.—The disease which has been the cause of the trouble mentioned is in all probability what is known as ripe rot. It is a disease which lingers from year to year in the orchards, the germs being in the rotten fruit and elsewhere about the trees. The destruction of all decayed fruit would help to lessen the means of infection the next year, and so would spraying the branches and the entire tree with copper sulphate. This should be done early in the Spring, and then two or three times after the fruit is growing. The State Experiment Station at Blacksburg, Va., should be consulted for details, and it may be that an expert will visit the orchard and personally inquire into the trouble, and doubtless give much good advice.

H. E. V. D.

Short Talk on Cherries.

G. C. W., New York.—Name good varieties of large sweet white and black cherries suitable for an orchard in northern Saratoga County, N. Y. Why is it that growers do not raise larger quantities of white and black sweet cherries? Is there no demand for these fruits, or is it because the fruit is more difficult to raise than sour cherries?

ANS.—Governor Wood is one of the good cherries that is yellow with a red cheek. Napoleon is also a good light colored, sweet cherry. Tartarian is one of the best of the early, black sweet cherries and Windsor about the best of the late ones. One of the reasons why more light-colored cherries are not grown is that they show bruises very quickly and do not sell well. The red and black sweet cherries sell well but cannot be grown in all sections.

H. E. V. D.

Persian Walnut and Other Nuts.

L. W., Lutherville, Ark.—1. Where can I get seeds of the Persian walnut called Kaghazi in the Fall, from some one who grows them? 2. Where can I get a tree or two of the pistachio to plant?

ANS.—1. There are very few who grow the Kaghazi walnut, and they are nearly all in California. It would be well to look over the advertisements in the rural papers from that State, and send to those who have that variety. 2. It would be useless to try to grow the pistachio nut anywhere in Arkansas, for it is too tender. Moreover, this is a dicecious tree, that is, its male flowers are on one tree and the female ones on another, which makes it necessary to have one of each in order to get fruit.

H. E. V. D.

Diseased Pear Tree; Worms in Lilies.

A. W., Buffalo, N. Y.—1. What is the matter with a young pear tree when its leaves are covered with small growths the size of a pin-head? 2. What can I do for garden lilies when the centers of their stems are wormy, causing them to grow small and be very brittle?

ANS.—1. The red growths are probably caused by the irritation of some minute insect. It is not likely that much damage will be caused. The treatment most available would be thoroughly to spray the foliage with whale-oil soap solution, four to six ounces soap to one gallon of water, taking care to hit the under surfaces of the leaves forcibly. 2. We know of no cure for worms in lily stalks except to cut and burn all affected stems in order to limit the spread of the pest.

A Fertilizer for Strawberries.

E. A. W., Deruyter, N. Y.—What fertilizer would you apply to ground in fitting for strawberry culture? I have tried barnyard manure, but often find many foul seeds get a start in that way.

ANS.—The regular fruit mixtures made by the best fertilizer manufacturers will answer. If you desire to make a home mixture, the following will give good results: One part by weight of nitrate of soda, one part muriate of potash, one part fine ground bone and two parts dissolved or acid rock. This is an easy mixture to make and is very useful for all fruits.

Name for a Farm.

L. S. H., Moorestown, N. J.—Will you give me what you consider an appropriate name for an 100-acre farm, mostly in fruit, especially strawberries, of which there have been 6,000 quarts picked in one day?

ANS.—We would hardly like to suggest a name for a farm without knowing all about it. Such a name ought to suggest some striking feature about the place, or some sentiment or ambition connected with it. Some farms are named after individuals—the name may be a combination of different personal names—or it may indicate some special feature of the place, as "Pine Tree," "Cherry Lawn," "Lakeside," "Hill Top," etc. We think that every farm should have a name, but the farmer or his family should select the name themselves. The more true sentiment and poetry you can get into such a name the better.

Capital in Farming.

A. W., Buffalo, N. Y.—What, in your opinion, is the smallest sum of money one could start farming with? Wouldn't it be better for a beginner to take a small productive farm rather than one run down?

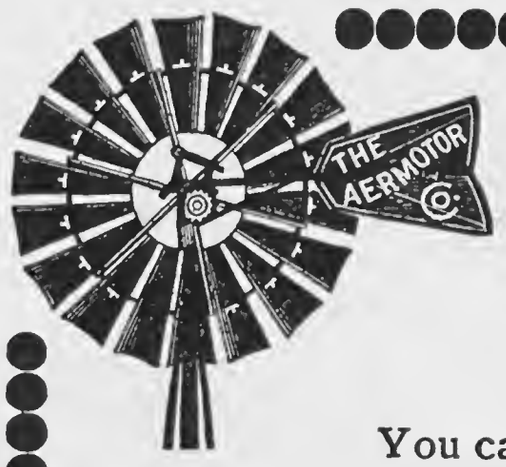
ANS.—If you were to ask us to name "the length of a piece of string" we could answer about as well as we can this question. What sort of "farming" do you mean? Do you intend to grow strawberries and other small fruits, or do you mean to try poultry or other stock? You can easily see that what is called intensive farming requires more capital for stock, fertilizers and help than the culture of such crops as potatoes, grain and hay. We would make no general estimate of needed capital without knowing what you intend to do. A man going into the grocery business will need more capital than a baker or a real estate man, for his stock will cost more, and he cannot turn it over so rapidly. A small productive farm near a good market will enable a man who knows how to raise large crops. Some men, however, will make more on the rundown land. It will cost less, and if they succeed in restoring it at fair cost the chances are that the value will increase. A man new to farming ought to have spare capital enough to carry his entire family one whole year at least.

Cherry on Marianna Plum Stock.

D. S. C., Milford, Del.—I noticed a short time ago, that you said you had heard that Early Richmond cherry will do well budded on Marianna plum stocks. Is it your opinion that other general varieties of cherry will do well on Marianna stocks?

ANS.—I have never tried budding cherry upon plum stocks of any kind. I have no experience to guide me in making an answer to this question, but have heard several persons say that different varieties of the cherry will succeed fairly well on the Marianna plum stocks. However, I should not like more than to make a trial of it. As all of the sour cherries do very well on Mahaleb stocks, I do not see any very good reason for trying the Marianna plum stock, but perhaps the latter will do well in soil that does not suit the former.

H. E. V. D.



WRITE FOR OUR

Windmill Book

You can't buy a windmill wisely until you read our book.

It is a book of 40 pages, with 125 pictures, telling in a delightful way just what you want to know.

Its writer knows more about windmills than any other man in the world. The book is free; let us send it.

To get the wrong windmill is a pretty costly mistake—a mistake from which no guaranty can protect you.

You cannot tell whether a windmill is good or bad until you set it up, and setting up is expensive.

Suppose you find then that it isn't right; that it requires a high wind; that it is going to stand still about half the time when you want it to work.

You can't return it without taking it down. The cost of erecting and removing it is more than the cost of the windmill. This book avoids that for you. It will make you wise on windmills, so you can't make a mistake.

Of course the book tells about *Aermotors*.

We know that a man who reads it will buy no other windmill. That is why we publish the book.

But it tells only the truth. It makes you a capable buyer. And when you know what you should know about windmills, you will know you need the Aermotor.

ABOUT AERMOTORS

Twelve years ago the writer of this book made the first Aermotor. He made it after 5,000 exact experiments with 165 different wheels. He had spent a year and a fortune in getting a wind-wheel right.

The first Aermotor was ten times better than the best windmill before it. It required but a third as much wind. Even a zephyr would run it.

This man kept on making improvements until he had covered the Aermotor with 55 patents.

Then he introduced the steel tower.

He invented machinery to make Aermotors cheaply. One machine alone does the work of fifty men.

He cut the cost of wind power to *one-sixth* what it was when he started. The saving is yours.

THEY ARE CHEAP

One result is that an Aermotor costs you less than any other windmill worth putting up. It has 55 important, patented features that no other windmill has. It has a wind-wheel which runs when all other wind-wheels stand still. It will outlast any other windmill, and some of them two and three times over.

CONTROLS THE WORLD'S TRADE

Twelve years ago all the windmill trade of the world belonged to others. Now more Aermotors are sold than of all other windmills combined. Six men out of each ten who buy windmills buy Aermotors. The other four would buy Aermotors, too, if they knew them.

No man will knowingly pay more than Aermotor prices for a windmill not half so good. That is why we ask you to send for this book. We don't ask you to buy direct. We will refer you to our local dealer near you if you choose. But write here for the book.

Don't buy a windmill without knowing what a windmill should do. Write now, lest you forget. Address

AERMOTOR CO., 1206 Twelfth Street, CHICAGO

We have another book about Power Aermotors for doing all sorts of work — for grinding, for sawing, for cutting feed, shelling corn and running many kinds of machinery. This book is free, too. Also a book about Pumps, Tanks, Substructures, Pipes, Fittings and all sorts of Water Supply Goods. We make 160 tons of Piping daily. Our plant occupies more than 30 acres. This is considered a pretty good sized farm in New England.

BORDEAUX MIXTURE AND POTATOES.

Do you find that it pays to use Bordeaux Mixture on potatoes? How often do you use it, and would you advise the average farmer to spray?

We believe in spraying potatoes with Bordeaux, and have practiced it considerably in former years. This year we regret to confess we have neglected it. Work has never pressed us harder, as planting, hoeing and haying have all come in a heap. Help that is good has not been overabundant and we have been compelled to take some chances. We always plant only the early varieties, which are usually matured before blight strikes our section, which is generally not earlier than August 1. If we can have two more weeks of good growing weather our potatoes will probably come out all right. H. G. MANCHESTER.

Connecticut.

In answer to your spraying query, I have not sprayed my potatoes for several years. Previous to that I sprayed for three years in succession with Bordeaux Mixture, and came to the conclusion that it did not pay me. To do any good all are agreed that one must begin early and keep it up well through the season, spraying from three to five times. This is not only costly but interferes with the other farm work. Two of the three seasons that I sprayed the potatoes which were not sprayed lived as long and yielded as well as those which were sprayed four times. I perhaps may be pardoned for discontinuing spraying after this experience even though some experiment stations recommend it.

Ohio. C. G. WILLIAMS.

We find it advisable not to spray potatoes with the Bordeaux Mixture for blight, till the vines are about two-thirds grown (others differ as to size); consequently, we have not sprayed any yet this season. However, now, July 12, we are about to spray our experimental plot of 308 named varieties and as many seedlings. With this plot, we are to make a thorough test along the line of blight and its treatment with the Bordeaux Mixture, a report of which we would be glad to furnish you later in the season. In this section this dread disease is not so disastrous as in others. Fortunately for us, we have been nearly exempt from this misfortune since 1896. We shall not treat our main crop, this season, and from our experience, we should not advise the average farmer to go to the expense of spraying his potato vines as a preventive of the blight and rot. Were it a cure, and to be applied after the disease appeared, our advice would be otherwise. At this date, potatoes are looking very promising, though cultivation is backward, due to abundant rain.

Prattsburg, N. Y. HILER BROS.

We have three acres of potatoes planted first week in June; have sprayed them but once with Bordeaux, one pound copper and one pound new-process lime to 10 gallons water. I like the new-process lime much better than the old way of slaking it. As to your question whether I find it necessary to spray, I am entirely unable to answer it. Have sprayed for several years, and my neighbors do not. I have better potatoes than some, and some have better than I. I have neglected to leave rows through the field without spraying to test, but my private opinion is that as the Paris-green can be put in the Bordeaux and both applied at once, it pays to use the copper. I also spray strawberry and tomato plants, and think I can see good results in bright healthy foliage, and certainly it drives away many of the smaller insects that prey upon the different kinds of plants. I shall continue to use the copper unless it finally gets in a "trust" and the price goes too high. Potatoes came up poorly on account of our inability to work the ground before planting so as to make a proper seed bed, but where they did get a stand they are making a good growth. The bugs are simply fearful, with no symptoms of dyspepsia, and think they are more able to digest Paris-green than ever before. Many pieces will be badly damaged. I think the present crop will cost to raise and harvest it every cent we can hope to get for it.

La Plume, Pa. GEO. SISSON.

There is considerable conflicting testimony in regard to the efficacy of spraying with Bordeaux Mixture for blight, and I have never yet found an average potato grower who *knew* he had made the practice to pay. The recommendations come mainly from experiment stations and close observers who are able to detect a small difference in yield. These yields are from small plots and may be misleading, as a difference of 10 to 50 bushels per actual acre may be due to many causes, and actually occurs every year on every farm. I have no doubt that the effect of Paris-green, hot weather and flea beetle on the foliage is often called blight, and that the spraying would then be of no avail. The blight, if it comes at all, does not show with us until some time in August, and spraying before August 1 would do no good. I do not think any effect is seen from the different blights, except the late blight, which kills all foliage in two or three days, until the potato foliage begins to mature; or, in other words, the blight has a season of growth, and requires certain conditions of foliage (its seed bed) before it will germinate. As long as the present hot, dry weather continues, there will be no genuine blight. Potatoes are so late this year that they should, with favorable weather, be exempt from it. If one knew just when a wet, muggy spell was coming on, and could cover thoroughly every spot with the copper, and it did not wash off, there would be a benefit; but the job is usually only half done, and there are so many ifs that the average potato grower will not be the gainer. I use as strong a solution of the copper water as I can make without lime in my hand sprayers when putting on Paris-green, and shall not use anything else this season for blight. The blight germ is not killed except it comes in contact with the copper, before it germinates on the outside of the leaf, and, if a small part of the plant is left uncoated with copper, the remedy fails. From the difficulty of hitting all parts of the foliage and the careless methods employed in putting on the copper, leaving out the washing off and cost, I do not think it any use for the majority of potato growers to spray. Potatoes in this section are looking well. The foliage is dark green and healthy and there is no apparent disease at this date.

C. E. CHAPMAN.

FARMERS AND THE GRAIN MOTH.

New Jersey Alive With It.

What are New Jersey farmers planning to do in order to save the wheat from the Angoumois grain moth?

Many of the farmers read the article published in THE R. N.-Y. last Winter and are expecting to act in accordance with advice given, viz., early thrashing and storing in bins, using sulphide of carbon if necessary. The recent wet weather has damaged the wheat badly, preventing harvesting and developing rust. In fact, Jersey farmers are having a bad time with the elements this year so far. D. E. R.

Keyport, N. J.

So far as I have been able to learn it will be very bad. I have lots of it in my wheat, and have arranged to thrash it out as soon as possible. Many farmers expected to thrash it in the field, but the weather is so wet that they cannot. My experience has been that it is wise to thrash it as soon as possible. That seems to check it in a great measure. I have not used the entomologists' remedy but think I will try it. Apple crop in this county is not more than 25 per cent average, pears 60 per cent. I have a very fair crop of Kieffer pears, but that is unusual. D. D. D.

Monmouth Co., N. J.

We were troubled seriously with the Grain moth last year. As far as understood, our farmers will thrash during August and sell at once, or put in bags and hold as may be advisable, as we learned last year by experience, wheat thrashed about September 1 was not injured by being kept in the bags, no matter how long it remained in them. All wheat either in stack or buildings thrashed after October was seriously injured. D. C. L.

Middlesex Co., N. J.

Thrashing Grain in the South.

There must be a change in the system of thrashing grain in this section. Labor is so very scarce that we can't get enough hands together to wait on the machines that thrash as much as 400 or 500 bushels a day. What we want is a machine that will do good work with not over four horses, and eight men and boys to do everything, and thrash 150 bushels per day. Where can we get such? My idea is that a gasoline engine would be the thing to furnish the power if we could get one not too heavy to haul over our bad roads. The old tread powers that were introduced here 15 or 20 years ago were no good. R. M'A.

Saxon, N. C.

R. N.-Y.—This talk about a scarcity of farm labor comes from all over the country—South as well as North. A prominent southern paper is even advocating the repeal of the Chinese Exclusion act, so that the Chinese may be brought in large numbers into the Southern States! The St. Albans Foundry Co., St. Albans, Vt., makes all sizes of thrashing machines, from a small foot power machine to the largest. Doubtless other separator manufacturers can supply what is needed. Tread powers have been greatly improved in recent years. The exhibits at the fairs indicate that this power is becoming popular once more. The gasoline engines are being used extensively. They are lighter and smaller than steam engines.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

Strawberry Report 1901

The following strawberries were planted, as received, from April to June, 1900, on a sloping plot of sandy loam of very moderate fertility, with a low humus content, as it had been cultivated for many years without manure or soiling crops. Very good sweet corn was grown the preceding year by the aid of raw fish applied at the rate of two tons to the acre. Good cultivation was given the strawberry plants during the season, and the runners were layered in a triple row during August, keeping off all that were not wanted. An application of high-grade chemical fertilizer at the estimated rate of 600 pounds to the acre was made soon after the layers rooted, and worked in about the plants. A close mulch of salt hay and Gladiolus stems was put on after the first sharp freeze in December, and parted sufficiently to allow the new growth to come through in early April. The fruiting season, with its record of excessive moisture during the blooming period, and burning heat at the latter part of the fruiting, is too recent to need further comment than to say that the later berries were in nearly every instance cooked on the plants. The first 19 varieties were received from Joseph H. Black, Son & Co., Hightstown, N. J. Several have been tried in previous years, and were favorably reported by THE R. N.-Y., and it is noteworthy that another season's test confirms our previous estimate of their good qualities. Staminate or perfect flowering varieties are marked (S), and those with imperfect blooms (P):

JIM (P).—Very vigorous in growth, broad, dark-green foliage, berries large, heart-shaped, deep scarlet; firm, rather acid, borne on long stiff peduncles. Early and productive. The dense foliage shades the berries so that they ripen up well.

LEON (P).—Strong stocky plants. Early and fairly productive; light green foliage. Berries large, light scarlet, roundish; flesh white, colors well all over, pleasant acid flavor.

PROF. FISHER (S).—Late, coming in with Gandy. Vigorous plants, tall, broad foliage; berries large, sometimes cockscombed, smooth and firm, bright scarlet; quality fair. A great producer of fine showy market berries.

REBA (P).—Late, vigorous, with large healthy foliage. Greatly resembles Prof. Fisher as grown here, but three or four days later. A very satisfactory berry.

ROBBIE (S).—Late. Strong stocky plant with broad dark foliage. Very productive of large, conical, brightly-colored berries. Quality very good, less acid than most late kinds. The berries hold up well in size throughout the season. A worthy late variety, exceeding Gandy in value as grown here.

CLARENCE (S).—Plant of moderate vigor, foliage good, and resists rust well. First berries very large, but fall off later. Immensely productive. Firm, not very sweet, but of good flavor; bright red in color. Midseason.

HAZEL (P).—Strong plants with heavy dark foliage like Jim; less productive than that variety. Berries large, firm and brightly colored, good table quality. Midseason.

CARRIE SILVERS (P).—Large plant with rather light green foliage. Berries bright scarlet, round shape, carried on a short, stiff peduncle. Quality agreeable. A productive and worthy variety. Midseason.

MINA (S).—Poor grower as compared with others. Foliage inclined to rust. Berries round, well colored and of good quality, borne on short stiff stems. Midseason.

HAM (S).—Vigorous, with broad, very dark foliage. Productive in a high degree of large, long berries, very dark in color, smooth and solid. Flesh deep red. Excellent quality. Appearance and quality better than Marshall as grown here, and much more productive. Early, but keeps up well throughout entire season. An excellent table and home berry.

ALMAN (P).—Late, vigorous and fairly productive; berries large and bright red color, but of indifferent flavor.

IRENE (P).—Midseason. Heavy green foliage. Appears productive at first, but does not fill out later berries; rather sour and watery.

OLIVE (S).—Vigorous, with thick dark foliage. Long peduncles; berries good size, dark scarlet; colors well and of fair flavor, but is irregular in ripening.

HOWARD (S).—Late, strong, productive plant; berries carried on thick peduncles. Foliage tough and resistant. Very large berries, often cockscombed, firm and well colored. Quality fair, better than Gandy. A very promising market sort, shown in Fig. 220, page 514.

MRS. FISHER (P).—Late, vigorous; a good plant-maker and bearer of fine berries. Fruit held up well on long peduncles, bright scarlet in color; fairly firm and acceptable quality. Seems to be adapted for near markets.

JOE (S).—Late. A large rugged plant, immensely productive of enormous berries which have been illustrated in previous issues of THE R. N.-Y. Firm; deep red in color, often cockscombed. Quality good for so large a berry. Evidently a valuable market variety. Ripens just before Gandy, but holds up well.

NETTIE (P).—Very late; comes after Gandy. Tremendous cropper in comparison with most standard varieties. Berries large and somewhat irregular in form; rather soft and sour. Color pale scarlet. Most of our berries were scalded by the great heat. Fig. 217, on first page, fairly represents a cluster of this distinct berry. Needs a better flavor and more firmness to render it valuable.

SUCCESS (S).—Early, vigorous and a profuse cropper, light in color but firm and handsome. Holds size well. A valuable market variety.

GLADSTONE (P).—Late. Large plant with tall light foliage. Set many large berries, which did not come to perfection. Greatly resembles Sharpless, and is no improvement under our conditions. Quality sweet, but rather insipid.

NEW YORK (S).—W. F. Allen, Salisbury, Md. Strong grower, makes many plants. Good dark foliage. Large dark red conical berries of excellent quality; productive. Did not hold up as well as some, but undoubtedly a fine berry.

KANSAS (P).—W. F. Allen. Vigorous; makes many runners. Bears a large crop of moderately large, bright red, conical berries on short peduncles; firm and sour in taste. Good for shipping; late midseason.

SEEDLING No. 4.—A. B. Howard, Belchertown, Mass. Very late. Fine vigorous plant, resistant foliage. Large berries, first in cluster, often cockscombed. Firm and bright in color. Quality very good. Productive, holding out to the last picking in size. See Fig. 218, page 514.

SEEDLING No. 103.—A. B. Howard. Vigorous low-growing plant, not inclined to make runners. Profuse crops of medium round, bright scarlet berries. They are bright and attractive, but too sour to be agreeable. Would make a neat variety for hill culture for home use.

SEEDLING (S).—Rhea Stayton, Bowling Green, Ky. Early. A low-growing productive plant. Berries smooth and well colored, but of poor quality and quite soft.

Standard and new varieties such as Greenville, Tennessee, Gandy, Marshall and William Belt bore fair crops of good berries under similar conditions.

W. V. F.

Twig Blight and Peach Budding.

S., Woodlawn, Va., speaks of the ends of the limbs or twigs dying on apple trees. I think this is due to the Twig blight and not canker worms as Mr. Van Deman suggests. It often attacks the young twigs or ends of the limbs and kills them back a few inches outright. If they die with full foliage this is the cause, and while it injures the trees somewhat it is not serious on the apple. It attacks certain varieties more than others. York Imperial, Smith Cider, Fall Pippin and a few others are very liable to the attacks of Twig blight. In regard to budding, I have had a very large experience with it in the past 40 years, especially with the peach. New Jersey grows large quantities of peach trees and has many experienced and expert budders. We have many men who can bud from 3,000 to 5,000 peach trees in a day of 10 hours. The work is nearly all done by the 1,000 by those who do this work alone, and the present price is from $1 to $1.25 per 1,000, according to quantity and condition of stock. We think a man who cannot set over 1,500 to 2,000 peach buds is not expert enough to do it well. CHAS. BLACK.

Hightstown, N. J.

ACCORDING to an Australian contemporary, the San José scale has been practically stamped out in the Colony of Victoria, but it has appeared simultaneously in many localities in Tasmania, where extensive warfare against it must be instituted.

THE "CLARK" GRASS.—"All who have tried Mr. Clark's method of grass culture, please stand up and report."—R. N.-Y., July 6.

I tried Mr. Clark's method to the letter, with two exceptions. I did not sow mixed seed and I did not use any fertilizer; but sowed pure Timothy on land that would grow 80 bushels of shelled corn per acre. We have had a very fine season for grass, and that grass will not make over a ton per acre. It did not freeze out and is extremely thick, yet it is very poor. Why? I believe had I sown a peek to the acre it would have made four tons per acre; judging from other fields. L. S. S.

Tolono, Ill.

Hope Farm Notes

I will try this week to answer a few of the questions which have been asked of late.

Why do you grow rye?

I did not intend to have a kernel of rye on the farm. The crop is what I call a weather accident.

What do you mean by that?

The rye was all seeded last Fall after some other crop. I meant that it should cover the ground during the Winter. This Spring I meant to cut it for the cows as long as it was soft enough and then make hay of the rest.

Why did you not do this?

We did feed it green as long as the cows would eat it. As most farmers know, rye soon becomes tough and hard. When it should have been cut for hay, the air was like a great dishrag. As it was impossible to cure the rye for hay, I let it go to straw and grain, though I was sorry to do it.

Why?

Because the land, near the buildings, would have paid much better in other crops. For example, we could have grown early potatoes, with drilled corn fodder following, and seeded to rye again in the corn. It is true that we can still set late cabbage or drill yellow turnips after the rye, but I do not think these crops will be very profitable this year?

Why not?

The cold, late season has prevented farmers from planting some of their usual crops, and they will now stick in lots of cabbage, in an effort to get some returns from the land. I think it will be much the same with yellow turnips, though some will be used in place of potatoes.

Have your own plans been interfered with in this way?

Seriously. We put one field into oats because it could be worked early, and we, of course, figured that the rest of the farm could be plowed and fitted. Had I known of the steady rains that were ahead of us, I would never have sown oats in that field, but would have reserved it for potatoes or corn. Another field, where we had cow peas last year, has not been plowed yet, so that we have lost for this season the value of that fertility.

Do oats pay?

I doubt if they do with us. I do not raise them for the grain, but cut them for hay. When well cured, they suit us as well as the best of hay.

Are they hard to cure?

I used to say no—but that was before I tried to cure them in a season like this one. We shall lose part of the crop this year, in spite of all we can do. In fact, barely 10 per cent of our hay this season has had a good chance to cure. At least three-fourths of all our fodder has been soaked at least once.

Shall you sow much rye this Fall?

I think not. I believe wheat will pay better.

Why do you think so?

The grain of wheat is more useful for our farming, though rye and corn ground together make good horse feed. The rye straw is salable at fair figures, but wheat will make much better fodder. It can be cut, even when the grain becomes hard, and make good hay for stock. I am so short on fodder that I shall sow wheat, so as to cut it early if need be. I may sow rye late—it has some advantages over wheat.

What are they?

It will give fair growth and yield on poor ground. Wheat needs better soil or more fertilizer. Wheat with us must be sown comparatively early. Rye will stand late seeding—in fact, we have a good piece of rye that was sown last November. We can clear off a late crop and sow rye for a Winter cover.

Shall you sow wheat alone?

No—we expect to seed to Timothy with clover added next Spring.

Then you are going to drop the famous "Clark" method of grass seeding?

No, not entirely, but I am pretty well convinced that in order to make that system pay its best one must have the best condition of soil to start with. My fields are all more or less rough and hilly. I may, in time, be able to grade and drain them, so that the Clark method will have a fairer chance. My experience this year seems to show that, until our lands are made smoother, at considerable expense, the old plan of seeding with grain is more profitable.

Do you not believe in Mr. Clark's advice to seed heavily?

I will not answer that positively until I see how my hayfields behave next year. The grass on them now is as thick as a lawn. The Timothy has hardly appeared, and the Red-top is quite short. I believe that future crops will be thinner and higher, and that the Timothy will make a satisfactory appearance later. I will not, therefore, condemn the grass yet, though it falls far short of filling the place in the barn that I blocked out for it. To a man who has strong soil, smooth and well drained, I would certainly advise the Clark method—provided he was willing to spend some money and time on the crop.

We judge that the season has not been very satisfactory to you.

On the whole, no. It has been difficult to do any work right. The nearest approach to it with us was the setting of the Stringfellow peach orchard. Our corn is backward, while the potatoes are fair. Hay is disappointing, but our apples promise to make up the loss. The farm has been greatly damaged by washing. The cows have done well, we have not lost a single pig out of 25, and the mare and her colt are in excellent health. July finds Hope Farm in much the condition of some men of middle age. From earliest boyhood they have worked under a shadow. Poverty, affliction, natural depression of spirits, physical defects and strange and little-understood burdens have been heaped upon them. At middle life they see that the best of youth has gone, and through it all they have not been able to develop any one of their loved ambitions in their own way! Such men will carry a life-long sorrow in their hearts yet, without knowing it, the habit of work and thought tempered by these very trials may still carry them on to nobler achievements than they ever dreamed of. We realize that we are 75 days from an average frost yet! Many things may be done in that time—that is, provided we have decent weather!

Are your potatoes satisfactory?

I suppose a farmer should never feel fully satisfied with his crop, but the potatoes promise well. They are in hills and have been well tilled. During the fearful heat they wilted, and did not have a good color. I thought they needed more fertilizer.

Can you put it on so late and get returns?

We have put nitrate of soda on potatoes in early July and increased the crop—but that was in a very dry season. This year we mixed equal parts nitrate of soda and sulphate of potash.

Why did you not use some form of phosphoric acid also?

We did not have any on hand, and I did not consider it so necessary for potatoes. On a crop like grain, which must mature seed, the phosphoric acid would be necessary, but for potatoes I think not, when used so late in the season.

How did you put it on?

Hugh and Philip dropped it by hand—scattering a handful around each hill—not touching the vines, but in a circle about six inches out. This meant about 275 pounds per acre. They covered about half the field by July 9—then rain drove them out. It was July 16 before they could work in it again, and I felt that it was too late to do much good. The moist weather had helped the plants and they had taken on a better color. I finally agreed to let the boys put fertilizer on half the field and the remainder on half of one of the Clark grass fields. The other halves will be left as they are, and we shall see if the fertilizer pays so late in the season.

But what is your opinion about it?

I think more of my opinions than I used to, and therefore keep them more to myself! My former experience was on light sandy soil, quite level and in a dry season. I have now heavy hillside soil with a very wet season, when drenching showers may be expected. I expect to see the nitrate and the potash color the plants, make them better able to stand the blight, increase the size of the tubers, and also delay their ripening for a week or 10 days. That was the result on the light soil, but the heavy soil may not respond in this way and, on the hillside, there is constant danger that the fertilizer may be washed out. If the fertilizer is put on too late, it is apt to cause prongy potatoes. A naturally wet season will, on ground with fair drainage, cause a heavy growth of top; but, unless there is a fair amount of sun, the tubers do not form well. When people look at potato tops in a wet season and guess at the yield of tubers, they are likely to put it too high.

What about corn and late fertilizing?

We shall put the regular corn fertilizer on each of our 10 acres of corn. The stalks do not have the right color. The corn was planted on last year's potato field without manure. At any time up to the formation of the ear, the fertilizer will make itself felt. We scatter it around the hill. If put on when the stalks are about waist high it will, I believe, do more good than if it were put in the hill at planting.

On January 1 you gave a statement of the value of live stock and hay. Have you ever considered the plan of making two estimates—one in January and another in July?

Yes, it is not a bad plan. Our account this year would stand about as follows:

	January.	July.
Horses:		
Frank	$150.00	$150.00
Dan	125.00	125.00
Major	15.00	15.00
Nellie Bly	125.00	125.00
Peter	40.00	40.00
Maria S.	.....	50.00
Cows:		
Jersey	25.00	25.00
Julia	.....	45.00
Genevieve	.....	40.00
Heifers:		
Blossom	30.00	35.00
Daisy	15.00	20.00
6 pigs @ $7	42.00	.....
4 Berkshires @ $20	.....	80.00
3 grade sows @ $12	.....	36.00
17 pigs @ $2.50	.....	42.50
1 porker	.....	10.00
70 hens @ 40 cents	28.00	.....
50 hens @ 35 cents	.....	17.50
196 chickens @ 20 cents	.....	39.20

Really the horses are worth more than they were in January. They would all sell for more and sell more readily. The colt, Maria, I put at $50, though she is worth more than that. It is not possible to give a fair estimate of the value of fodder and hay, because this year's crop has not been housed. H. W. C.

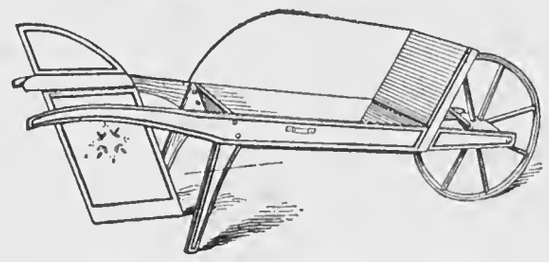
In every town and village may be had, the

Mica Axle Grease

that makes your horses glad.

Made by Standard Oil Co.

WHEEL BARROWS.



Flat hickory spoke, 22-inch wheels, shrunk steel tires, one inch wide. Strong enough for heaviest load, light enough for the boy's use; nicely painted, and an ornament to your premises. Price $3.50, direct from factory. Hickory spoke wheels alone, fully ironed, $1.25 each. The boys can make the bodies on rainy days. DON A. GILBERT & CO., Bainbridge, N.Y

SATURDAY, JULY 27, 1901.

ALL applications for the Ruby Queen rose received since July 1 have been filed, and the plants will be mailed next Spring, as soon as a new lot can be propagated. The season is now too far advanced for the successful planting of young roses.

*

DURING the past few years many legal papers were signed but not stamped as the law required. It has become a custom to put the stamps on when the money or other obligation was required. Now that the law no longer requires these stamps on money contracts it was hoped that these old papers would escape the tax. The Treasury Department decides that the date of the paper is the date of delivery. In other words, all such contracts made during the years when the tax was in force must be stamped before payment can be enforced.

*

WE have a letter from a reader in Pennsylvania who expects to visit the Pan-American Exposition. He purposed to load up before starting. He is a fruit grower and he wants the names of some of the best fruit men in Niagara County, so that he can go and look at their farms. We call that business. Some people would not care to look at a tree while away from the farm, but this man wants to learn all he can. He will find some useful teachers among the trees and men of Niagara County. If he could only attend one of the meetings of the Niagara County Farmers' Club he would have the educational trip of a lifetime.

*

WE begin the discussion of the question of farm values this week. We try to obtain reports free from prejudice. We are after a fair statement of true farm values as compared with former years. Thus far a majority of the reports seem to show that farm values have declined, and that it is much harder than formerly to sell farm lands. We have also reports of increase in such values. In some localities it is certainly true that the earning capacity of the land has been increased, so that its value for the business of farming has risen. In some cases this is due to the production of special crops, like apples, while in others it is due to the general improvement of the soil, or to a new town population caused by greater outputs of oil or coal. We wish to learn about these things, so that it may be made clear why such farm values rise or fall.

*

SOME remarkable predictions have lately been published, attributed to Secretary of Agriculture Wilson, to the effect that within a few years the United States will raise and produce everything it needs without recourse to foreign importations. Tea will be grown in immense quantities in the South, and rubber, coffee, spices and other tropical products in the various islands recently added to our political territory. Sugar is to be turned out in such incredible quantities by the beet sugar factories that the Secretary says, in his opinion, the sugar trust will vanish, as it now depends on the refining of imported brown sugar for its profits, while the beet factories turn out the finished product. We all hope that the Secretary's glowing prophecies will materialize, but only a child-like and sanguine temperament can expect the effacement of the sugar trust by the increase of home production. The steel, oil and the countless other monopolies, covering almost every commodity in general use, certainly do not depend on the importation of raw material for their profits, but on their absolute power to control the output and fix the selling price on one hand and the cost of production on the other. If refined sugar could be made at home by every farmer who grows the beets, just as maple sugar is produced, there might be some hope of worrying the trust, but it is well known that the beet sugar process requires the investment of great capital to construct and operate an effective plant. It does not need a very expansive intellect to foresee the rounding up of all the beet sugar factories in a grand trust, possibly by the very capital now used by the present sugar trust in refining imported sugar. It is no more rational to wait for the trust problem to solve itself than to wait for an epidemic of yellow fever to burn itself out without taking all known precautions to restrict the plague. A cure for predatory trusts will come in due time, but hardly in the manner outlined by our imaginative Secretary of Agriculture.

*

THE French have developed the automobile so that it has become a really serviceable machine for common use. There was recently a road race from Paris to Berlin in which remarkable speed was made. Part of this success is due to the fine country roads which now cover France and Germany. Our country roads are not yet ready for the auto—but it will come. It is not too much to expect that the coming farmer will own a machine which will hustle his crops or his family over the road, and if required stand on three wheels and hold up one to turn machinery or pump water.

*

WE desire to call attention to Mr. Morse's article on page 514. It may be said that the practical gardener cannot afford to bother with seed growing. It ought to be evident that he can well afford to plant improved varieties or strains of vegetables. We do not believe he can depend on the seedsmen entirely for improved strains any more than the dairyman can depend on the breeder of purebred stock. Both must do more or less breeding and selecting in barn and garden in order to secure the individuals that are exactly suited to their farm. Mr. Morse explains this matter well. Another thing which he does not refer to is the fact that such study and observation will prove the most interesting work that an intelligent gardener can take up. If one can interest the boys and girls in such study the farm will have stronger attractions for them and they will make better farmers and better citizens.

*

THE wheat crop of the country seems assured. All reports indicate that it will be the largest crop ever produced in America. The corn crop seems to be in danger. Much of it was planted late, and the frightful hot weather of the past two weeks has been very destructive in the great corn-growing States. Our own reports show that corn is likely to make a fair crop after all. The late planted fields are now growing fast, and the plant has wonderful vitality and will often recover and make a fair yield after it appears to be ruined. A season like this brings out the vast importance of the corn crop. It does not rank in export value with wheat. Last year the total exports of corn and cornmeal were valued at $87,354,810, as compared with $140,997,966 worth of wheat and flour. That was largely because Europeans do not yet know a good thing when they see it. The total value of last year's corn crop was $751,220,034, against $323,525,177 as the value of the wheat. No wonder people are worrying about the corn crop. Its loss will be a National calamity.

*

THE following letter from a reader of THE R. N.-Y. is worth more than passing attention:

I believe that THE R. N.-Y. is meant for people who do not know it all, and who want to know more. The questions I have to ask will seem very simple doubtless to the one who answers them, but are very important to me. I am just beginning, and the things I don't know are legion. If you have an expert at your disposal, and can spare the space will you have the questions answered? I do not care for the opinions of the average readers. I can get all sorts of advice at home, but want something scientific and authoritative.

Our friend is right in supposing that THE R. N.-Y. is chiefly for those "who do not know it all, and who want to know more." We do not feel competent to satisfy the "know-it-all" folks, and shall not try to do so. We welcome questions, no matter how simple they may be, provided those who ask them are sincere in their desire for information. We think we are safe in saying that no agricultural paper in the world has a wider range of correspondents, or a more thorough acquaintance with agricultural experts and authorities. While we try to make all answers clear and easily understood, in case the meaning is not made plain we are always willing to try again and make the information more soluble. There is a great demand for advice from practical people. Our friend has had an overwhelming supply of home advice, and now wishes to test it at the cooking stove of science. We shall try to start the fire.

BENEFITS from organizations among farmers are not always evident at once. The surest and most enduring growth is slowest, and sometimes months or years must pass by before definite results are to be seen. In some cases, too, the benefit, if any, does not come in the way that was expected, but indirectly—through some unexpected means. An illustration of this is found, in the history of the Five States Milk Producers' Association. This organization started out to sell and deliver enough milk to control the supply in this great city. The job was too big, and the plan failed, at various times. Then the Association began quietly and steadily to encourage the building of coöperative creameries and cheese factories. In this way they are providing the true outlet for the surplus milk, and if the plan can be fully worked out the producers will finally control the market. Several years ago the farmers through the South and West made a tremendous effort to better their condition. They organized the Farmers' Alliance and Populist parties. While most of their political plans failed, they did, without starting to do so, organize some social and industrial reforms that could not have been started otherwise. In old times the farmers dealt and competed with individuals. Now, from carrier to final seller his products are mostly handled by organizations. There is therefore more reason than ever before why farmers should join their forces.

*

BREVITIES.

Beside a southern river years ago,
Over which he rowed his ferry to and fro,
A shrewd old negro with a wrinkled face
Sat nodding in his shady resting place.
When the horn blew upon the other side
Old Uncle John his stiffened joints untied,
And slowly rowed until his shortened sight
Revealed his passenger—a raw "poor white,"
With skin, hair, clothes, shoes, teeth the same dull hue.
The captain of the ferryboat well knew
The breed—he made his bargain while afloat
"It cost free cents to ride in this here boat,"
With whining voice the fellow made reply,
"I ain't got no three cents—ner no one nigh
Ter lend me none"—
—"Well, sar, ef any man
Can't raise three cents an' hasn't got no plan
Ner nothin' else it surely 'pears ter me
Ez fur ez I am competent ter see,
It don't make no great odds fer loss or gain,
Which side de ribber no such man remain!"

NO rum on the fair grounds!

OAT and pea fodder is a perfect cow ration.

OH, how the clover is starting after the grain!

THE hay crop seems, on the whole, disappointing.

NO! NO! You can't irrigate a dry field from the eyes.

HARD to find—a hired man who will feed grain to the stock economically.

WE do not care for guesses at truth unless they are plainly marked as such.

THE most destructive battery that you can turn on some good folks is flattery.

AT Hartford, Conn., the kerosene remedy for mosquitoes has been tried with success.

THE Coddling moth gets into the heart of many a parent and ruins the spirit of the child.

WISE was that man, he may make farming pay, who hoed or cultivated when he could not hay.

THE practical men are divided on the question of spraying potatoes with Bordeaux Mixture.

Is it safe to fumigate seeds with the fumes of hydrocyanic acid gas? Not when they are damp.

Do you know that it pays to spray potatoes with Bordeaux Mixture, or do you just think so?

IT is reported that during the fearful heat in the West prices offered for eggs went down to three cents per dozen!

WHY have the experiment stations suddenly stopped issuing bulletins on tuberculosis? They surely have not "stamped out" the disease!

WING HUNG ON & Co. is the name of a Chinese firm in New York. If they have as much hustle and hang on as the name indicates, they deserve to succeed.

"WHAT can you farmers find to do in Winter?" We once asked that question while riding through northern Vermont. Here is the answer: "We have a town library of 10,000 volumes!"

WE hear of a man who sprayed potato vines with Bordeaux Mixture. The Potato stalk-borer killed many of the vines. Now the man says he always knew Bordeaux Mixture would not prevent blight!

IT is reported that the First Regiment of N. Y. Volunteers at their State camp consumed 970 quarts of milk at one supper! That is a sort of *can* teen performance which the country can easily stand. By all means encourage the milk can in the army. If we must have a standing army we can find a profitable job for the soldiers in the wise assimilation of milk, cheese, apples and other products of the farms.

THE experts say that when new, damp hay is housed the barn should be tightly closed. Many farmers say that the doors should all be opened so as to let the air freely circulate. The objection to this is that the moisture, if to leave the hay at all, must do so by evaporation. In the hot barn this moisture will slowly make its way out. In the open barn the cooler air from outside will condense the moisture and send it back to the hay.

Events of the Week.

DOMESTIC.—Nineteen persons were killed, several probably fatally injured and a large number wounded, as the result of a head-end collision between passenger and stock trains on the Chicago and Alton Railroad, near Norton, Mo., July 10. . . . . The American fishing schooner Wynonia, of Gloucester, Mass., has been run down off the Grand Banks, N. F., by an unknown steamer; 18 lives lost. . . . . A workmen's train was precipitated 87 feet by the collapse of a trestle on Crooked Creek, Springfield, Pa., July 12, and out of 18 men who were carried down in the crash nine were killed, five fatally injured and four severely hurt. . . . . A fire at Enid, O. T., July 14, caused $100,000 damage. . . . . Six persons were drowned while bathing in the surf near Savannah, Ga., July 14, five of the bodies being swept out to sea. . . . . Joseph Bartley, former State treasurer of Nebraska, who embezzled nearly $100,000, has been released, after serving 49 months of his 20 years' sentence. . . . . An excursion boat on the Susquehanna River blew up at its dock at Sunbury, Pa., July 13, killing three persons and injuring several others. . . . . Colorado, which abolished capital punishment four years ago, has reëstabliished the death penalty for murder. . . . . Fire destroyed the packing house of Jacob Doid & Sons, at Wichita, Kan., July 16; 7,000,000 pounds of meat were destroyed, and the total loss was $1,000,000. . . . . July 15, Gov. Dockery, of Missouri, issued a proclamation setting apart July 21 as a day of prayer that the drought might be broken. Little rain had fallen since April 27.

PORTO RICO.—The Porto Rican Assembly, July 4, unanimously passed the resolution declaring that the Island's revenues are now self-sustaining, and requesting the President to proclaim free trade between Porto Rico and the United States. . . . . The Secretary of the Treasury has requested of the Attorney-General an opinion as to whether he has a right to refund to importers the amounts of duties collected on merchandise brought into this country from Porto Rico between the date of the ratification of the Treaty of Paris and the date of the approval of the Foraker act, and, if so, under what authority and from what appropriation.

GENERAL FOREIGN NEWS.—The Turkish government has paid to the American Minister at Constantinople $95,000 in settlement of various pending claims for indemnity by American citizens against Turkey. The State Department will make the distribution among the claimants. . . . . San Domingo suffered most severely from the recent storms which swept over the southern part of the island. All the crops are damaged. . . . . Intense heat prevailed all over Europe during the second week in July, accompanied by severe storms. Crops were damaged by hail in France, Germany and Switzerland.

FARM AND GARDEN.—The worst drought ever experienced in Texas was broken by a heavy storm July 14. The rain came in time to save the cotton crop. It will also benefit fruit and lowland corn.

A meeting of the Nebraska State Horticultural Society was held at Kearney, Neb., July 17 and 18. Among those present were Gifford Pinchot, forester of the United States Department of Agriculture; William Hall, superintendent of the forestry survey of Nebraska, and F. H. Newell, hydrographer of the United States geological survey. Governor Savage and J. Sterling Morton were also present during the session.

A severe hailstorm seven miles north of Muscogee, I. T., July 16, killed some stock and destroyed crops for a considerable distance over a strip a mile wide. Heavy rains fell over the Creek and Cherokee Nations, generally saving crops.

The annual picnic of the Niagara County (N. Y.) Farmers' Club, will be held at Lake Island Park, Wilson, N. Y., Saturday, July 27.

Secretary Coburn, of the Kansas State Agricultural Bureau, does not believe the damage to Kansas corn has been so great as claimed. There are 900,000 acres of Kaffir corn not materially affected, and 40,000,000 bushels old corn in farmers' hands, nearly one-quarter of a full crop.

Rain fell over an area of 80 miles around Kansas City, Mo., July 16. At Lawrence, Kan., it was the first moisture in 26 days. Ottawa, Wellsville and Toronto, Kan., and Camden Point, Mo., also report good rains. Although some fields are reported too far gone to be saved, it is believed late corn will be greatly revived. In the three Missouri counties east of Kansas City the crop is reported in prime condition. Generous rains fell July 17 over the larger part of the corn belt of the Southwest. The good that will result to late corn and to pastures will undoubtedly be great. Scattering showers fell over the Southwest July 17 and 18, but in most places continued accounts of intense heat were reported. Reports from many counties assert that this rain, following what little had fallen within the previous forty-eight hours, will insure at least half a crop of corn and makes pastures sure.

The New York State Department of Agriculture placed a nursery inspector at Rochester, one at Geneva and one at New York as soon as the shipping season began in 1901 to look after the shipments of nursery stock arriving in the State at those principal points. As a result, several lots of stock were detained and found slightly infested with the San José scale. The infested stock was destroyed, the accompanying stock was fumigated, and notice of the discoveries was sent to the consignees. About June 1 seven inspectors were assigned to the divisions of the State, and commenced the inspection of orchards. Up to July 6 the reports show that 326 orchards, embracing 4,776 acres and containing over 456,000 trees, most of which are of bearing age, were examined. Less than 50 of these orchards show an infestation of San José scale, some of them very slight. Badly infested trees have been destroyed, and many trees have been sprayed with kerosene mixtures with the expectation of keeping the scales from spreading. The "Maple worm" or Forest caterpillar has appeared in great numbers in the apple and plum orchards of the State, and in some sections the canker worm has done much damage. The Department is having a large number of experiments made in various parts of the State in an effort to ascertain the best Summer treatment for San José scale on bearing trees. Small trees, even if badly crusted with this scale, can be saved by fumigation when the trees are dormant. The inspection of the nurseries of the State has been commenced, as it must be finished before the Fall shipping season begins.

L. T. Yeomans, president of the New York Fruit Growers' Association, writes that the meeting of the Wayne County Fruit Growers' Association is to be held August 17, instead of August 19, as noted in THE R. N.-Y. Wayne County will not have 10 per cent of a full crop of Winter apples, instead of 25 per cent, as given by one correspondent.

The Connecticut Pomological Society will hold its second field meeting of the season on July 30 at West Haven, visiting the 25-acre peach orchard of President N. S. Platt. Waverly Grove, on the Sound shore, will be headquarters for the day, and a shore dinner will be served at noon. Visitors should take electric cars to the Grove, whence they will be conveyed by teams to the orchard.

CROP PROSPECTS.

The apple crop is poor, hardly half crop. Potatoes fair, peaches full crop; 100,000 baskets in this vicinity. Corn backward, but promising; hay good; wheat good in straw, with some rust. W. S. A.
Bendersville, Pa.

Iowa is not such an apple-growing State as will interfere largely with the general market. A late report from the secretary of our State Horticultural Society, based upon replies to inquiries previously mailed to fruit growers throughout the State, shows the prospects for apples at 52 per cent, while other fruits range from 60 to 82 per cent. It is rather early to give reliable information about the apple crop, because things happen after this period profoundly to modify the final result.
Pres't Am. Pomological Society. C. L. WATROUS.

Prospects for a fruit crop early in the Summer were excellent, but the dry weather for the past two months has cut down the prospects very materially. The report 60 days ago was an average for the State of about 75 per cent; to-day it is not more than one-half of that, and if the dry weather continues much longer it will be still lower. In some localities in the State there have been good showers, but these are only a small part. The young orchards are seemingly holding their fruit very well indeed. We are still in hopes of being able to supply the buyers from the East, but from the outlook now before us we are sure the prices will be very good.
Kansas City, Mo. L. A. GOODMAN.

The wheat and rye crop is very good. I sowed Harvest King wheat last Fall and never had a better crop. Oats are short and rusty, on account of too much rain and cold in Spring. Corn crop is not so very good on account of late planting, although some fields look quite promising. The potato crop is not very good; early potatoes poor and small. Late potatoes may yet be a good crop if we get repeated rains. On account of late planting and dry weather some are just coming up, while those that are up are loaded down with bugs. Quite a lot of late cabbage was planted last week. Most of the early cabbage failed to grow, the ground being too dry for it to take root. Hay is not very good; rain came too late to benefit it. It may be called about two-thirds of a crop. We had a nice rain recently, the first we had since the fore part of June. We had some very hot days, the rays of the sun being almost unbearable; too hot to work in the fields. J. S.
Drums, Pa.

JULY 10.—We are having the longest and most ruinous Spring drought and season of extreme heat this section has ever experienced. Beginning with early Spring, it has been continuous and progressive, until yesterday and to-day the temperature was and is 112 degrees on the north porch of my house. Most of the strawberries and all the bush fruits dried up as they stood in the fields, and gardens are gone. Plums, peaches, grapes, everything shriveling and drying up. Pastures and meadows dry as tinder; early corn ruined, oats a failure. Meadows and hay crop very light. All the conditions of the most extreme August drought of other years are now with us, and have been for nearly two months without change. The most complete all-'round failure of crops ever known here is the result.
Clinton, Mo. J. R. G.

JULY 11.—The apple crop will not be 50 per cent, on account of the dry weather, and the fruit is dropping very badly. Corn looks well, but needs rain; the potato crop will be poor on account of the drought, but there are plenty of Potato bugs. Wheat and rye good; hay a fair crop; oats poor on account of rust and drought.
Newlin, Pa. A. B. W.

JULY 15.—I am casting longing eyes towards that stone house at Hope Farm these days. For the last six days our registered thermometer indicates from 99 to 103 degrees. Uncut hay is curing as it stands. Oats and Spring wheat are ripening too fast and should all be cut this week. Corn does not seem to be suffering materially. All crops were about 10 days later than usual, but made it up last week. J. S.
Corning, Iowa.

JULY 15.—Owing to rain, harvesting and making hay has been very much delayed the past week or 10 days. The wheat crop is fair; some fields are bugged badly in our section. In an adjoining county the crop is mostly destroyed. The peach crop promises to be a good one if nothing happens to it. Apples are scarce. Hay crop good, hay selling out of the field for $10 a load. Oats looked very bad about the first of July, but since the rains (which continue right along) came, they have grown to make up for lost time, and will be good size yet. Corn and potatoes look fine. Farmers are behind with their work. Lots of buckwheat to be sown yet, and quite some corn to plow. Some will not get plowed the last time if the rain continues. It being so dry the early part of the Summer the pasture fields got very short, which caused a great shrinkage in the quantity of milk. The farmers in this section are not in the milk business to any great extent, keeping only from six to 10 cows, as it is impossible to get any help. J. W. F.
Hunterdon Co., N. J.

JULY 15.—Farmers here have been considerably discouraged, but oats, corn and potatoes promise much better at this time. Wheat is now being mowed, as the Hessian fly has made it impossible to reap it. There was a large acreage of onions this year, but the heavy rains damaged them at least 70 per cent. Many fields were plowed up and set with cabbage, which looks well. Many acres of sugar beets were abandoned on account of weeds. Farmers were obliged to reduce the acreage of beans on account of wet weather. Apples are not one-fourth of last year's crop, and Baldwins are "not in it." Peach orchards that have been well cared for will produce a fair crop. The orchard of Addison Weed is a notable example. Men are now thinning the fruit. Pears promise fairly well. Several hundred acres are devoted to raspberries, and they promise an extra yield. The Ohio and Columbian varieties prevail, and they will nearly all be evaporated. Picking began July 15. Timely rains since the floods have been to our advantage. We have had good hay weather, and the crop has been nearly all secured. No hot weather since July 4. E. A. G.
North Rose, N. Y.

MICHIGAN APPLE CROP.—Regarding the apple crop in Michigan I can only express an opinion. I believe we are going to have not far from 40 or 50 per cent of a crop in the State. In some localities there are almost no apples, and in others quite a full crop. There was some dropping during the excessive heat of a few days ago. There have been more than the usual number of exigencies during this season. Floods, winds, heat and frost have all done their part to shorten the crop. The Grand Rapids market is planning to handle a pretty large peach crop, and as usual we expect to do it in such a way as to be profitable to the grower. Our system here, it seems to me, is a very profitable one. All of the peach interest tributary to Grand Rapids has nothing to do with commission men. Buyers center here from the outside and purchase directly on the market—having the fruit delivered to some packing station, and paying for it at once. This simplifies the marketing for the grower very much, and is very satisfactory.
Michigan. CHAS. W. GARFIELD.

NEW HAMPSHIRE NOTES.—July 15.—Since July 4 the weather here in southern New Hampshire has been ideal—and yet we are never quite satisfied, for it has been what old farmers call "catching," and therefore not ideal from the haymaker's point of view. Showery conditions have prevailed during this period, and, as the weather would clear with fine prospects, farmers would keep the machines humming, only to get a lot more hay wet. The showers here this Summer have been peculiar in cloud formation and in duration. Instead of a mass of black clouds rolling up and giving us a smart shower with a fine electrical exhibit, and then clearing away in a short time, we get a "sea-turn," which comes in very quickly and it rains easily and with scarcely any wind and not much thunder. July 11 we had such a shower and the rain fell heavily for seven hours. This rain caught nearly every farmer with hay all open and much of it ready for drawing in. Where fields have been mowed for a week, grass has sprung up with surprising rapidity, and this gives a beautiful lawn-like appearance. There is a diversity of opinion in regard to the hay crop here. Many declare the yield to be no better than in 1900. Others say a third more. Speaking for myself, I know it is much better both as regards quality and quantity than last year. Potato patches are well worth looking at now. Likewise the cornfields. This is not a grain section, but some rye is raised, and Winter rye is now ready for harvest and will yield well. Those who raise oats to any extent complain of smut. This is an apple section, and, while I have not been able to see some of the large growers in the Rockingham County belt, it is safe to say that the crop will be pretty near a total failure. I should say it would not be up to 10 per cent. This is a milk-producing section, and sometime I want to tell THE R. N.-Y. about the methods in vogue here. There is not a great deal of pasture land here, and the herds of cows are like locusts, inasmuch as they consume every green thing except the blinds on the farmer's house. Besides, "brewery grain" or malt is fed heavily, and many farmers buy tons and tons of hay. Is it good farming? D. L. P.
Dover Point, N. H.

Government Weekly Report.

From the Rockies to the central valleys the intense heat continues, with but little relief from local showers. The late corn has been standing the drought remarkably well; but the early crop in the Central West has been practically ruined. On the Atlantic coast rains have been abundant, and harvesting interfered with to some extent on this account. The northern Pacific coast continues unseasonably cool, frost being reported in Washington, July 12. Wheat is ripening prematurely in the southern part of the Spring wheat region. In the extreme northerly sections the outlook is more favorable. Oat harvesting in the north is in progress. The crop has been badly cut by heat and drought. The cotton prospect in Georgia is at present below the average. In the Carolinas it is making too much stalk, on account of the heavy rains, which have also hindered cultivation. In Texas early cotton is being picked. Extensive heat damage to apples is reported in the West.

The Kansas hay crop is nearly a failure, on account of drought, but there is plenty of wheat straw, and this will be used in its place. This makes a boom in straw, which is now worth from $5 to $8, while in years of a full hay crop it sometimes goes for $1 a ton.

Several provinces in the Volga region of Russia are in a bad state, owing to drought. For nearly two months the temperature has ranged from 120 to 140 degrees. The streams have dried up and nearly all crops ruined.

ROOMS AT BUFFALO.—There is an erroneous impression abroad regarding the cost of accommodations to Pan-American visitors in Buffalo. While it is true that many of the hotels are taking advantage of the rush and charging exorbitant prices for accommodations, it is equally true that better accommodations can be secured in private families for less than one-third the price charged by hotels. The New York State Grange alone has an option on over 5,000 rooms located in the best resident sections of the city. By writing Mrs. B. B. Lord, Grange Building, Exposition Grounds, Buffalo, N. Y., accommodations can be secured in these rooms for $1.00 per day for each person. There are more rooms to let in Buffalo than can possibly be filled, so no one need stay away from this greatest of expositions on account of lack of accommodations. J. H. DURKEE.

Woman and Home

From Day to Day.

MR. JABEZ HALL ON RELIGIOUS UNREST.

"They're huntin' fer a new belief to take
the old one's place;
The doctors and professors ain't quite
satisfied no more,
And it seems to sort of got to be a kind
of mild disgrace
Fer folks to keep believin' as their parents did before.
They say it shows you're ignorant to think
that God's up there
A-guidin' this old world along and
watchin' day and night;
They say the Bible's only a historical
affair;
And they're fixin' up new doctrines fer
to keep things goin' right—
But with all their talk and tinkerin' they
hain't arranged it so
That folks can quite afford to not be
decent here below.

"I don't pretend to know it all, and mebby
there's a way
That's better than the one our mothers
wanted us to take;
They may find a fairer doctrine or arrange
a creed some day
That'll not have enny flaws in and'll
neither bend nor break;
But with all their college learnin' and their
searchin' high and low,
And their great philosophizin' there is
one thing they forget—
They can take the creeds and smash 'em
and bring out their proofs to show
That the old religion's foolish, but there
ain't none of 'em yet
Found a way that they can fix it so we
needn't try nor care
To be righteous or be decent and still
keep a-gettin' there.

"The ones that keep a-kickin' at the old
religions most
Ain't worried over whether Moses really
talked with God,
And I guess they'd find it easy to accept
the Holy Ghost,
If in doin' so there wasn't a straight
pathway to be trod—
What we want's a new religion that'll let
us all be free
To give our inclinations a loose rein and
let 'em go;
But none of these here creeds they're get-
tin' up, it seems to me,
Is helpin' out a speek, and what's the
use, I'd like to know?
If the ones that turn and get the new re-
ligions they arrange
Must still keep bein' good, why, what's
the use of enny change?"

—Chicago Record-Herald.

*

ONE of our friends writes that green tomatoes and onions, sliced and fried together, just as onions would be done alone, make an excellent combination.

*

PROF. Minnie A. Stoner, dean of the woman's department and professor of domestic science in the Kansas Agricultural College, has been appointed professor of domestic science in the Ohio State University.

*

FARMERS' Bulletin No. 128, issued by the United States Department of Agriculture, is devoted to eggs and their uses as food. It will be found very interesting either to the housekeeper or poultry fancier, and may be obtained on application to the Superintendent of Documents, Union Building, Washington, D. C.

*

HAVE any of THE R. N.-Y. housekeepers tried canning fruit by what is called the California cold-water process? A correspondent writes of it as follows in a daily paper:

For years my mother and I have canned pieplant, butter beans, corn, etc., by a simple process. I wash pieplant and cut into pieces about three inches long (not peeled), pack closely in Mason jars, and fill the jars to overflowing with cold water, making sure there are no air bubbles left in the jar. Screw the tops on the same, as in canning fruit, and put in a cool, dark place. When opened, I have been told by visitors that you would think I had just picked the vegetables. I have never used this recipe on small fruit, but have canned pears, apples and quinces this way, as well as vegetables.

A FRIEND asks us how to make a species of root beer with essence of spruce and oil of wintergreen. Probably the following recipe is the one meant: Nine quarts warm water, one yeast cake dissolved in warm water, two pounds sugar, five drops essence of spruce, 10 drops oil of wintergreen, 15 drops oil of sassafras. Stir until the sugar is dissolved, bottle, cork tight, keep eight hours in a warm place, then put where it will keep cool. It will be ready to drink in three days.

*

COLD roast bacon will often fill an emergency in the Summer bill of fare. Select a square piece weighing three or

3876 Infant's Kimona, one size.

four pounds, soak it over night. The next morning put it on to boil, allowing it to simmer very gently three-quarters of an hour to the pound; then let it go cool in the water in which it was cooked. When cold drain, remove the skin, rub the fat well with sugar, pour over it some cider vinegar, and roast in the oven until brown. When cold cut into thin slices; it should be tender and delicate in flavor.

*

MERCERIZED gingham petticoats have a pretty luster, and wash very nicely. They are pink or blue, and cost 75 cents each. Shirt-waist suits of this mercerized material are pretty and inexpensive. The shirt-waist suit and the shirt waist buttoning down the back are the two most striking developments of the present Summer. Women are wondering why they never before thought of making skirts to match their shirt waists. The waist buttoning down the back is the natural development of the present unbroken styles of trimming. It is not always becoming, and it is not at all easy to get into such a garment unassisted. To see a woman frantically endeavoring to fasten small pearl buttons in the immediate vicinity of her shoulder blades, one might imagine her trying to emulate the acrobatic feats of a circus contortionist. Probably it is very good exercise for a person of sedentary occupation.

*

IN one of the private schools in a town there is a small boy who is always cheerfully miles behind everybody else, says The Household. He is not a dull boy, but learning does not appeal to him as being a thing especially to be desired. Recently the teacher told the class in composition that on the next day she would expect each of them to be able to write a short anecdote. She explained with great care the meaning of the word anecdote, and next day, when she called the class up to write, all but the laggard went at once to work. "Why don't you write an anecdote, Rob?" asked the teacher. "I forget what an anecdote is," said Rob, undisturbed. "I explained it yesterday, Rob; and you ought to remember," said the teacher, a bit out of patience. "An anecdote is a tale. Now write." Rob bent over his slate, and with much twisting of brow and writhing of lip, ground out his task. When the slates were collected, his was at the very top of the heap. The teacher picked it up, and this is what she read: "Yesterday we had soup made from the anecdote of an ox."

*

THERE is a small girl in a Pennsylvania public school who finds a good deal of difficulty in comprehending the mysteries of arithmetic. One day when the teacher was examining the class all answered their questions quickly and correctly until the foot of the class was reached. "Sallie, what is eight minus six?" Sallie could not answer, which was nothing unusual. Whereupon the teacher, thinking it might aid her by stating it less abstractly, said: "Now, Sallie, if your mamma went to the barn and found eight eggs and used six of them to bake a cake, what would she have left?" With a smile of contempt, Sallie answered, "Why, shells!"

The Rural Patterns.

One of the prettiest new ideas in infants' wardrobes is the little kimona shown. The little garment is made with the regulation kimona yoke and full skirt portions that are gathered at the upper edge. The sleeves are large and full and the neck is finished with a roll-over facing that is extended to form bands for the fronts. When desired, the kimona can be cut off at the line indicated in the pattern and made short as shown in the smaller sketches. To cut this kimona, four yards of material 21 inches wide, or 2¾ yards 32 inches wide, with 2¼ yards of contrasting color for yoke and bands, will be required for full length; 1⅛ yard 21 inches wide, or ⅞ yard 32 inches wide, with 1⅜ yard for yoke and bands when cut short. The

3864 Blouse and Knicker's, 4, 6, 8 yrs.

pattern No. 3876 is cut in one size only. Price 10 cents from this office.

Blouse and knickerbockers form one of the most satisfactory suits for small boys. The blouse is cut on the simplest possible lines. Both fronts and back are plain and smooth across the shoulders and are arranged on a draw string at the loose edge. The sleeves are comfortably loose while sufficiently well fitted for correct style, and the neck is finished by means of a square sailor collar that is held by a ribbon tie. The knickerbockers are shapely and snug about the hips and at the waist, and are drawn up by means of elastic below the knees. To cut this suit for a boy six years of age, 3⅝ yards of material 27 inches wide, 3¼ yards 32 inches wide, or two yards 44 inches wide, will be required; to cut the blouse, 2¼ yards 27 inches wide, or two yards 32 inches wide; to cut the knickerbockers, 1⅛ yard 32 inches wide, or ⅝ yard 44 or 50 inches wide. The pattern No. 3864 is cut in sizes for boys 4, 6 and 8 years of age; price 10 cents from this office.

Concerning Those Household Expenses.

I shall have to send a supplement to our report on page 442, for Jay's criticism has roused our New England "dander," as perhaps you know it might. Of course I didn't send everything in my account, for I didn't understand that *everything* was wanted. What I did report was merely the expenses of *living*, exclusive of *luxury*. Butter was included in the grocery bill, but for Jay's further information I will say that we used 73 pounds of butter in the year 1900. Jay need not "alas," until he knows that we *don't* enjoy life. We *do* live in a nice neighborhood. Our nearest neighbors are a railroad treasurer, the teachers in world-famous Phillips Academy, professors in Andover Seminary, and equally famous Abbott. We *do* take three monthly magazines, and eight weeklies and semi-monthlies. Our own library is over 600 volumes; Andover has a most excellent public library, and we have access to the seminary libraries. Our son was graduated from Harvard College; one daughter went to Abbott. Both daughters and myself were graduated from Chautauqua. We own a pew in church, and *occupy* it. Do you suppose we should go there looking like "way-back?" My husband is an old-fashioned man, and *will not* wear any tailor-made clothing, but I really think you would know which way his "breeches are looking!" Our taxes last year were $96. We *have* traveled some, though we haven't been to Europe. Our own country has a good many things worth seeing. We are not behind hand in charity either, though I do not think that is to be counted in *living* expenses. We don't care to let our left hand always know what our right hand is doing. Could we do all this and *not* be careful and economical? None of us has a right to criticise where we don't and can't know everything. Our reasons are not and cannot be another person's reasons.

A Woman's Rose Bed.

GOOD VARIETIES IN NORTHERN OHIO.

A rose bed is an endless chain of delight. Beginning with the owner, it may be extended to her friends, her friends' friends and to the stranger that passeth by. If I were going to spend a Summer on a desert isle I would like to take along with my 10 favorite books, 10 good roses—and then I know I'd be tempted to smuggle some pansies and heliotrope into the package, with carnations, Cannas, Coleus and maybe a few bachelor's buttons, just to see, you know, how they would do! My rose bed is about eight years old, and of the original 12 everblooming roses set out there are four left, Hermosa, Queen's Scarlet, Meteor and Antoine Verdier. Antoine Verdier is a grand rose of a bright silvery pink, a prolific bloomer from June until November. The flowers are borne, usually, in clusters. I cut a cluster of four roses the other day, all nearly full bloom, that were perfect beauties. The buds are lovely, while a full-blown rose will often measure 4½ inches in diameter. The foliage is dark and glossy. It is the most sturdy and satisfactory grower in the bed, but it has not the exquisite fragrance of some of its more delicate sisters. The Meteor is also a strong grower with rich, dark red velvety blossoms—the color is perfect; unfortunately the buds will often blight before opening, so that the yield of perfect full-blown Meteors is apt to be scarce; still, it is too handsome in color to think of discarding it. The Hermosa and Queen's Scarlet are cheerful little bloomers. I have four of the former and two of the latter. "Old-fashioned roses—there ain't no style about 'em," as James Whitcomb Riley says, but they are faithful, and require no coaxing.

Kalserin Augusta Victoria occupies the center of the bed, and is five or six years old. A very lovely, large, cream-white rose of exquisite fragrance and rich, dark foliage, but it has never been the "robust grower and profuse bloomer" advertised in the catalogues. The blooms are perfect in bud and in full flower, retaining their freshness several days after being cut. It is quite up to its aristocratic name, bearing itself always with great dignity. I always cut my roses for callers, and take the finest that are out when I intend stopping to see a friend; they are a joy to me, and I know they give genuine pleasure to others. The Kaiserin Augusta Victoria has been the most admired of any of my roses. A close rival of the Kaiserin is a three-year-old Whlte La France (Augustine Guinoiseau). It is a more prolific bearer than her royal highness, and a trifle more delicate and graceful in appearance. The buds at the center are a lovely shell pink, while the full-blown roses are white, very large and fragrant, and retain their beauty well. I have had a cluster of three with four or five crimson Meteors on my desk for two days, and they are a study worthy of an artist's brush. Next in my list I must place a lovely canary-colored rose with superb buds borne on long stems. I believe it is a Mme. Hoste. Unfortunately the buds never open, which is singular. They grow to be full-sized buds and there they stay—when not cut they dry up. It blooms constantly throughout the season, and is a strong grower. Next La France, a beautiful pink rose that has thus far been a very shy bearer, but the plant was only set out last year, and perhaps has not been petted enough. Then Germaine Trochon, a very lovely salmon rose, tinged on the edge of petals with pink, clean, bright foliage of bronze green. It was set out at the same time as La France and has shown the same inclination not to be seen too often.

In replacing roses I have been careful of late to select the Hybrid Teas, as I have had so many of the Tea roses proper charm me for a season or two and then die out. Among these roses Papa Gontier, Perle des Jardins, Bride, Safrano, Marie Guillot and Marie Van Houtte, the last-named being a favorite. My rose bed has not the best location in the world, being on the west side of the house and too near a large crab apple tree. It does not get any sun until about nine o'clock in the morning and then not a bit of shade for the rest of the day. It is near the kitchen and gets occasional doses of dishwater and lots of wash water. I would like to give my roses, pansies and Chrysanthemums manure water twice a week, but I am sometimes late about getting a keg packed with the material requisite, and sometimes neglectful, but I know that they love it and ought to have it. My roses have been sprayed with the Bordeaux Mixture several times, and with kerosene emulsion once, the latter for the little green aphis, and it is death to those in sight, but they will come again. The foliage has also been thoroughly dusted several times with wood ashes and also with soot for slugs. Eternal vigilance, of course; without practicing that we would have to limit our experiments in floriculture to hollyhocks and sunflowers.

The Hybrids may be successfully propagated by means of layers, put down exactly as pragevines are layered, and cut away from the main stock when they have made a good growth. Two-year-old plants are most satisfactory. Roses love water with good drainage, and will amply repay us for all the drenchings we can give them. In regard to Winter protection they are lightly covered with straw after the first good freeze in the Fall; the ground should be frozen hard, and then any old boxes that come handy are turned over them—sometimes covering two plants and sometimes three with one box. The boxes are taken off quite early in April, and the straw removed gradually. Some people have a box made purposely to fit their rose bed, but it ought not to be airtight.

DOCIA DYKENS.

Preparation of Grape Juice.

Each year, as the grape season approaches, we are asked how to put up grape juice for family use. Several readers have given their methods, but it seems well to repeat former instructions, thus summed up in Green's Fruit Grower:

In proceeding, use only clean, well-ripened grapes. I prefer expressing the juice in an ordinary hand cider mill (same as making cider) by grinding the grapes. The advantage is, you get the juice at once, and that which is expressed by grinding is clear and retains so little foreign matter or pomace. It may, by careful strainlng through double thickness light flannel, be immediately bottled, while that obtained from pressing the skins, pulp, seeds, etc., will require beside straining a llttle time to precipitate a sediment resulting from pressing. I sometimes filter through a few inches of clean, washed river or creek sand. The sooner, however, it can be bottled and corked the less fermentation and the more of the peculiar grape aroma may be retained. Whereas, if the grapes are crushed in a tub or barrel I find it difficult or impossible to express the juice until fermentation dissolves the pulp, thereby losing much of the grape flavor, but the fermentation cuts no figure in the keeping qualities, as I sometimes, for variety, let some ferment to a certain flavor, when I heat and seal it with the assurance that when opened in the months or years following the same flavor will prevail.

I use the ordinary wine and beer bottles—carefully wash and drain them, fill to within about three inches of the top. Set an ordinary wash boiler on the stove; put an inch of sand on the bottom or fit a thin board over the bottom to prevent the bottom of bottles overheating to break or give the juice a cooked flavor; fill the boiler with bottles as close as they will stand without crowding, and fill the boiler with cold water within about four inches of the top of the bottles. Lay on the lid and start the fire; bring the water slowly to a distinct simmer, but in no instance allow it to come to a boil, as this, too, will cook the juice. Have your corks steaming. I use a one-quart fruit can; fill half full of water and put in the corks, lay on the cap, set alongside the boiler to heat and steam whlle bottles are heating. As soon as the juice gets pretty well heated the air will be thrown off in a volume of minute bubbles rising to the surface, which eventually brings to the top a thick scum or pomace in proportion to the amount of impuritles in the juice; this scum increases and pours over the tops of the bottles, which suggests the air is sufficiently driven off to proceed with corking. Lift out a bottle, place on a low table, blow off this pomace, pour off any surplus juice in excess of to fill to two inches of top of bottle, else the cork will not go down; insert a cork, giving it a twisting pressure with the fingers, pushing it down a little below the mouth of the bottle or can, use a cork driver to be had at any hardware store. Wipe the bottles with a damp cloth and set aside; proceed till all are corked; in refilling the boilers take out part of the water and fill with cold to a tepid temperature; fill up as before and resume the fire, then proceed to seal those already corked. I use the ordinary canning wax or cement. When melted add a teaspoonful of linseed oil to each stick of cement, which renders it more adhesive; it should then be well stirred and applied quite hot. I experience no difficulty in the juice keeping with the bottles in any position, but if upright if any sediment has precipitated the juice will pour off clear of the sediment. I keep the bottles in my cellar, which is cool, dry and frost proof. Seldom, indeed, that a bottle burst and then only by defective sealing. I do not put hot juice in the bottles nor bottles in hot water; have never used a thermometer to test the temperature of the water, but had I one would not let the water exceed a temperature of 190 to 200 degrees Fahrenheit, as water boils at 212 degrees. The same treatment applies to apple juice or cider.

BELIEVE me, every heart has its sorrows, which the world knows not; and oftentimes we call a man cold when he is only sad.—Longfellow.

THERE is a love that begins in the head and goes down to the heart, and grows slowly; but it lasts till death, and asks less than it gives.—Olive Schreiner.

THERE is a great deal of religion In this world that is like a life preserver, only put on at the moment of extreme danger, and then half the time put on hind-side-before.—Josh Billings.

THE principal requirements of a good paint are: *covering capacity, durability, appearance and economy.* Pure White Lead and Pure Linseed Oil is the only paint that fulfils these requirements.

A building painted with Pure White Lead will look better and last longer than if painted with any other material, and the first cost is less; and as its covering capacity and durability are much greater, it is by far the most economical.

For any color or shade required, use NATIONAL LEAD COMPANY'S Pure White Lead Tinting Colors. Pamphlet sent free upon application.

New York State Fair

SYRACUSE

September 9 to 14, 1901

$65,000 in Premiums and Purses **$65,000**

It will be the LARGEST LIVE-STOCK EXHIBIT ever held in the State.

Entries in the Cattle, Sheep and Swine Departments are being received from all parts of the United States and Canada

The Short-Horn Breeders' Association of America will duplicate the premiums offered in the Short-Horn class, making that class worth $1,085.

The Cattle, Sheep and Swine exhibited at the Pan-American will be shown at the State Fair.

An Auction Sale of Cattle will be held under the auspices of the Commission on Friday, September 13.

Entries in the Live Stock Department close August 10.

The Fastest Horses in America will compete in the races.

THE GRAND HORSE SHOW

will bring the best Thoroughbreds, Trotters, Hackneys and Coachers together that has ever been seen on the Fair Grounds. Everything in first-class condition.

GENERAL ADMISSION, 25 CENTS

Send for Premium List. S. C. SHAVER, Secretary, Albany, N. Y.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

MARKETS

THE WEEK'S QUOTATIONS.

WHOLESALE PRICES.

NEW YORK, JULY 20, 1901.

GRAIN.—Prices on wheat and corn are down one to two cents on reported rains in the corn belt. The most contradictory reports are being circulated regarding the damage done.

BUSINESS BITS.

ANOTHER of the good preparations to prevent flies from pestering horses and cows is offered by H. W. Doughton, Moorestown, N. J. Write for booklet and prices.

NOW is the time to prepare for your next year's strawberry supply. The potted plants set out anytime next month will bear next season. Write to T. J. Dwyer & Son, Cornwall, N. Y., for Summer catalogue.

THERE are many good thrashing outfits on the market, but if you want to keep your rye and wheat straw straight, you would better write to Grant-Ferris Co., Troy, N. Y. Their machines thrash oats and other grains like ordinary machines.

WHERE farmers do their own thrashing a one or two-horse outfit will often do the work. It may take a little longer, but will be cheaper than buying a large machine. Ellis Keystone Agr'l Works, Pottstown, Pa., manufacture such horse power thrashers, cleaners, wood saws, etc. F. L. Maine, Willet, N. Y., is agent.

IT is highly probable that no small steam engine yields the power claimed for it; even fewer "horse powers" do. From the effort of the animal, heavy mechanism has heretofore subtracted a great portion of the power, and it has remained for a Vermont firm to produce an ideal horse power. This power is known as A. W. Gray's Sons' horse power. It is manufactured at Middletown Springs, Vt. It is not a new thing, but its later improvements are all new and all very valuable—insuring lightness, with strength; ease of operation, with great durability; thoroughly good construction, with low price. Anyone contemplating a purchase of power or machine may have catalogue free by addressing A. W. Gray's Sons, Middletown Springs, Vt.

THE members of the Frost Wire Fence Company have been identified with the iron and steel industry, as well as the manufacture of wire fencing, for the past 12 to 15 years. The company was incorporated on May 27, 1896, at that time locating at Columbus, O. Owing to the fact that Cleveland possessed many advantages over Columbus for the manufacture of wire fencing, they removed their plant in June, 1897, to Cleveland. Their new two-story building will be completed and ready for occupancy not later than August 15, 1901, giving them a capacity for producing 60 miles of fencing per day, and they will still have room to increase their capacity threefold, if needed in the future. They are now prepared to fill all orders for the Frost fence, coiled spring wire, and steel gates, on short notice. The officers of the company desire to extend a personal invitation to every one visiting the city of Cleveland, to pay them a visit at their new factory, located on Lake Street, near Marquette.

THE man who knows most about windmills has written a book. It is a 40-page book, with more than 100 pictures. Every page of the book is interesting to a man who wants a windmill. Not a word will he skip. And when he is done, he will know all that anybody knows about windmills and what they should do. He cannot be fooled; but the man who buys a windmill without reading this book will regret it. Simply send your address, and the book will be mailed to you free. The writer of this book is president of the Aermotor Company. But the book is not biased, nor unfair. It is a book of information, written by the man who knows more than any other man about windmills. The writer of this book started in 12 years ago to make aermotors. The field was overcrowded. Makers with millions of capital, and tens of thousands of agents, controlled all the trade there was. The Aermotor Co. had little capital, no trade, no agents, no reputation. 'Twas a pigmy among giants. That was 12 years ago. To-day the whole earth is dotted with aermotors, and more aermotors are sold than of all other windmills together. That is a record with scarcely a parallel in the history of invention. The book will tell you how it was done. Write Aermotor Co., 1206 Twelfth St., Chicago.

WHEAT and corn are the principal market crops; but little other grains grown except for home use, and most of the corn is fed either to cattle or hogs within the county. We have in Sanborn County one cheese factory, five creameries and several skimming stations, all well patronized, so that our dairying is a source of considerable wealth to the farmers. Potatoes are looking extra fine; only about one-half of last year's acreage planted. We have had no bugs to fight for several years; have not seen a Potato bug this year.

Letcher, S. D. W. H. H.

Numbers of prominent people too honest to impose upon others, and too sagacious to be imposed upon themselves, use and recommend Dr. D. Jayne's Expectorant for Coughs and Colds.—*Adv.*

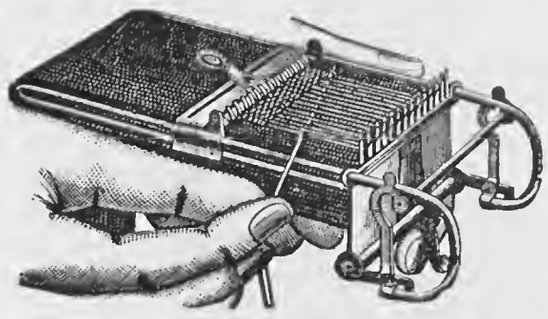
RHEUMATIC CURE
Perfected after 12 years' special study. Relieves quickly; cures permanently; removes cause of rheumatism and rheumatic fever. Formula free with convincing testimonials. Write
TURNER MED. CO., Dept. G, Boston, Mass.

Gold-Shell Rings.

Most people like a nice ring. We show three styles. These are made by drawing a shell of gold over a rod of composition metal. They are better and will wear longer than solid gold rings of a low carat. The retail price would be from 75 cents to $1. We will send one of these rings postpaid as a reward for sending one new subscription at $1. Cut a slip of paper the size of finger and send for size.

A Darning Machine.

This is the only successful darning machine we ever saw. We have tried others that were absolutely of no value. This one is little short of perfect. It enables you to mend underwear, stockings, curtains, table linens, clothing, and does an endless variety of art and fancy weaving better, easier and quicker than



by any other way. Full directions accompany each machine. When a lady has once used this little machine, she would not do without it for any consideration. We will send it postpaid for $1, or for two new yearly subscriptions at $1 each. All money returned if not satisfied.

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER

EVERYBODY'S PAINT BOOK, by F. B. Gardner. Instructions for preparing and applying stains, paints and colors; care of brushes, etc. Price, postpaid, $1.

My Handkerchief Garden.
How to Plant a Place.
Country Roads.
Fruit Packages.
Memory Training.

MARKET NOTES

INFERIOR CULLS.—This is a grade of eggs seldom given, as the need for such a quotation occurs only in times like the present, when, on account of excessive heat, stock is badly damaged in transit. These "inferior culls" wholesale at $1 to $1.25 per 30-dozen case. Just what they are used for is a question, but the thought is enough to cause one to refrain from indulging in restaurant scrambled eggs and omelets for a time.

SWEET CORN.—This has been coming from the South for several weeks, but quite a quantity of the south Jersey product is now seen in the markets. It comes in heavy sacks holding from 200 to 300 ears. Of course, the husk is left on, and thus the corn will keep in fair condition for a time, although no one expects that it will be equal to corn cooked an hour after it is picked from the stalk. This is true of nearly all vegetables, except onions, potatoes and other tubers. The freshness and delicate flavor are quickly lost if they are allowed to stand around in the sun for any length of time before being used. However, a great share of those who eat this corn in the city think it is all right, as they have never had anything different. There is a wide range of price, as it wholesales at from 75 cents to $1.75 per 100.

POTATOES.—Large quantities are arriving. The receipts for the week ending July 13 were nearly 110,000 barrels, mostly Maryland and southern stock, although the Long Island truck farmers are bringing in some of their early crop. Most of the tubers that I have seen in going about the potato sections of the markets, have been of good size and smooth. Of course, dealers usually display this kind rather than the inferior ones, but apparently those that are offered at present will average high as to quality. Maryland Rose is bringing the highest price, $2.50 per barrel, a 25-cent drop from previous prices. A good many farmers in New York and neighboring States, who raise medium-late varieties, have found a fair market in this city at digging time. At such times it may happen that the bulk of the earlies is out of the way, and the late ones are not yet on the move. This makes things a little slack, and those who are fortunate enough to dispose of their crop then are likely to make a hit. This is no cut-and-dried rule, however, as conditions are different every year. Those who keep in closest touch with their regular selling agents, and are prepared to act quickly, usually come out best.

WHO CAN MAKE BEST SALES?—A reader in Florida writes as follows:

"In shipping fruits would you consign to a general commission merchant, or one who handled fruits exclusively? Who keeps the neatest and best arranged store —— or ——? I shipped —— about $800 worth of strawberries last season. Their sales were not quite so good as those of another merchant situated on —— street. I believe them to be thoroughly honest, yet I can't account for this discrepancy. These berries were shipped in refrigerator cars, and sold on the same days."

There is not much difference in the appearance of the two stores mentioned, so far as neatness and arrangement are concerned. One has a little more room than the other, but that is no sign that he does a larger business or can get better prices. On general principles it is probably safe to advise shipping to dealers who make a specialty of the line of goods shipped. Still, there are exceptions. One of the best firms to sell fancy fruits that I know of does a general commission business; but they have been at it for more than 30 years, have the benefit of all this experience, and try to do the best they can for every shipper. It depends largely on the man. There are some who are so careless and lacking in judgment that they could not make successful fruit men if they worked at it for a thousand years. They sling crates of fruit around in a most reckless way, and give one an idea that they are better adapted to handling rocks or cord wood. Just why two lots of berries of equally good quality should sell for different prices on the same day, is a hard matter to explain, and can scarcely be understood by one who has not observed the constantly unsettled condition of a great market on goods that must be handled quickly. It would take a whole volume to explain these things, and after that the reader would not know much more about it than before, unless he came and spent days in going about seeing for himself. While the causes may not be seen in every case, it is nothing unusual for the same grade of fruit to sell at two or three different prices on the same day. Also, cases have been known where one fruit man, in order to get the trade of a shipper who had something particularly desirable, would make returns for the first lot or two at a premium, paying the increase out of his own pocket, but getting even by making short returns later. The case our correspondent speaks of was probably not one of this type. The reason that the second man got a better price for the fruit was doubtless that he had some special customer who was willing at that time to pay a slight advance. W. W. H.

Milk and Creamery Notes.

Since the condensery was built in Deposit there have been some improvements in the care and handling of milk. As soon as it is drawn from the cow it is cooled to a temperature of from 50 to 60 degrees by means of setting in a vat of cold water, and frequent stirring; but few milk coolers are in use in this section. S. C. S.

China, N.Y.

A majority of the stations about here pay within one-half cent of Exchange. No milk is being held back by farmers except at Baldwin's Station, where only about four or five patrons are hauling. The rest withdrew April 1 and send their milk to factories, because the company required the producers to sign a contract for one year. The flow of milk has been exceptionally good, but is shrinking quite rapidly now. Pastures are looking good for this time of year. Haying just barely under way; will be a good crop. Oats have been looking very rusty, especially early sown, but for the last week are heading nicely and color much improved. They promise an average crop. Potatoes and corn somewhat backward, but of late are making rapid strides for a plentiful harvest. W. I. F.

Sherburne, N. Y.

Our creamery at Lounsberry is not a coöperative; it is run by the Standard Butter Company of Owego. The milk is made into butter, the skim-milk into sizing. The farmers get the curd and buttermilk back, which make a good feed for hogs. They paid 70 cents per 100 through June. July 1 they raised to 76 cents per 100. Cows are doing very well. The supply of milk dropped off some during the hot weather last week. Grass is a fair crop, better than farmers thought before they began haying. Corn is looking well for being planted so late, growing very fast. Oats look better than they were a week ago; they are taking on a better color. The fly is working in the wheat some. Pastures are good, heavy rain July 5 washed fields and roads badly. Potatoes are looking well, with lots of bugs. F. L.

Lounsberry, N. Y.

Spencer Creamery situated in this village was consumed by fire June 9. People here firmly believe it was the work of an incendiary.

Skimming station three miles east has secured 8,000 to 9,000 pounds of milk daily. Price paid for May 62 to 77 cents per 100 pounds; in addition the producer receives his skim-milk, which is valued at 15 cents a hundred-weight, and by some more for feeding purposes. The variation in above prices is due to the per cent of butter fat. June prices at skimming station were better on average than May, as butter ruled during June one-half cent a pound better. Milk shipping station for June received 100 to 125 in 40-quart cans daily. Spencer is in the 32-cent freight zone, and producers receive 54 cents the 40-quart can net at station. Producers here having milk rich in butter fat prefer butter factory or skimming station; those with low per cent butter fat milk shipping station. Milk supply since June 15 has been gradually decreasing.

Cows are looking fine; good fresh cows and those which will be fresh by September are held firm at $40. Pastures generally good; some badly damaged by drought last year have not recovered. Haying commenced by July 1; meadows not drought-killed from last year have a fine stand of grass. Hay crop above average.

Spencer, N. Y. M. D. WATKINS.

A Western Town.

All western Missouri is passing through the worst drought ever known. For nearly two months no rain has fallen except one short shower. Day after day for four weeks the thermometer registered from 95 to 104 degrees with hot winds occasionally. The oldest inhabitants say, "Never saw the like in old Missouri before." Corn is ruined; potatoes ditto, except where planted very early; gardens are dried and burned up, and pastures look as bare and brown as wheat stubble. The great promise of an abundant fruit crop early in the season has not been realized, although berries were not as high as we expected—$1.25 to $1.50 per crate for blackberries, and $1.50 to $1.75 for black raspberries. Peaches and apples are dropping badly. The town of Independence is 10 miles from Kansas City, connected by electric road and four lines of railway. It is a most beautiful town, embowered in such great lovely trees of so many varieties. It is Kansas City's most rich and aristocratic suburb. Many who do business in the city have their homes here, and such beautiful ones. It is also a church and educational center—three colleges and 18 churches for a town of some 7,000 or 8,000 inhabitants. The Mormons have the largest and richest church here. This is their old stamping ground, and I hear they expect to find a temple built of gold and precious stones all ready for occupancy some morning when they awake. They own some of the best property in town, and are considered good citizens. Independence was also a hot-bed of treason in war times. Here Quantrell gathered his men to raid Lawrence, and the bullet holes can be seen now on the hotel here where he tried to get Gen. Buel out by bombarding, and, not succeeding, smoked him out with sulphur. But times have changed, and the Fourth was celebrated with all enthusiasm, and the Stars and Stripes were everywhere. F. C. J.

Notes from Pennsylvania.

July 13.—York County farmers have about finished housing the best wheat harvest they have had in many years. No fly in any fields sown after October 1, but some wheat sown earlier in the season was destroyed by the pest. Farmers are realizing the fact that late seeding in a very great measure protects their wheat crops against the Hessian fly. I have observed the stand of wheat to be thin in fields that were sown with commercial fertilizers when the ground was hot, dry and dusty. I think it pays farmers to wait with their wheat seeding until after October 1, and then sow only if the ground is sufficiently moist. I take it to be a mistake to sow wheat and fertilizers into the same row at the same time, as I believe that the tender wheat germ is destroyed where it comes into direct contact with the chemicals, particularly so in hot dry weather. We will sow ours separately this Fall. In this section of Pennsylvania the hay crop was generally very poor. Clover was all killed by the prolonged drought last Summer. This Spring the weather was cold and wet, so that what Timothy there was failed to grow until after June 1. Pastures are now very short and dry. Oats that were sown with fertilizers are very good and about ripe, while fields that received no fertilizer are very poor, short and still grass green. No crop responds better to good commercial fertilizer than oats. It pays to use it. Corn was never better at this date than now. Our corn was yellow early, but now nearly all corn is as tall as the fences and of a beautiful dark green color. There is a large field close to my home that has the color of the blue Atlantic Ocean, and, as it waves to and fro by the gentle wind, it reminds me very much of the ocean. It is a beautiful sight. Of course, the best fields of corn have been manured from the barnyards, and this leads me to say that our best farmers put their manure on corn land. The first week of July was a record breaker for heat. It was extremely hot both day and night. Temperature in the shade 100 and over, while in the sun it was too hot and high to be read. Many valuable working animals were lost by the farmers from overwork and heat. G. A. R.

Wrightsville, Pa.

A NEW ZEALANDER'S OPINION.—I think your system of questions answered by practical men of experience is admirable; also the wonderful patience shown in answering questions put by those knowing so little. I have often thought of the business educative power a paper might have that laid itself out as yours is doing to meet the want of its subscribers, and come into direct touch with them. So many farming publications fall into a chronic routine, and are composed of so large an amount of effete and useless matter, and irresponsible and sometimes dangerous misleading matter, unqualified by any editorial remark. J. DUDGEON.

New Zealand.

Just The Blues.

Many a woman dresses to go out, feels irresolute, sits down, and falls into a fit of despondent musing. Ask her what's the matter, and she'll probably answer "Just the blues." And what are the blues? Only another name, in general, for a disordered liver and a diseased stomach. Cleanse the liver, heal the stomach, purify the blood, and there'll be no more blues. It can be done by the use of Dr. Pierce's Golden Medical Discovery. This medicine puts the diseased organs of digestion and nutrition into a condition of sound health. It eliminates from the blood all impure and poisonous substances, and cleanses the clogged liver. It contains neither alcohol nor narcotics.

"I had liver complaint for the past fifteen years, complicated with dyspepsia and gall stones," writes Mrs. N. Bernier, of 461 Elm St., Oshkosh, Wis. "I doctored with seven of our prominent doctors, and not one or all of them have done me the good, nor begun to do what your medicines have. I have used three bottles of Dr. Pierce's Golden Medical Discovery, one vial of his 'Pleasant Pellets,' and one bottle of Dr. Pierce's Favorite Prescription, and have gained about eighteen pounds since I first began to take these remedies."

Dr. Pierce's Pellets cure biliousness.

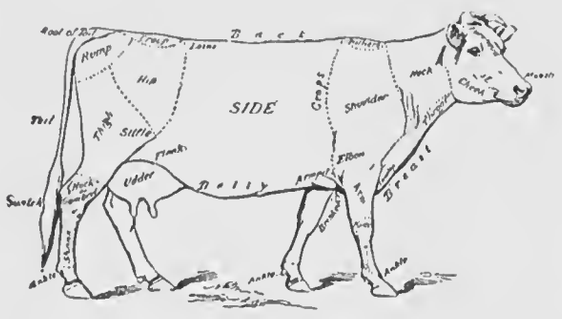
Live Stock and Dairy

SELECTING A DAIRY COW.

What to Look For! Where?

TWO CLASSES.—A most essential feature of a breeding female of any sort of animal, is the capacity to produce milk and suckle the young in a generous manner. The breeder of farm animals, no matter what class it may be, deeply appreciates this fact. Of all the various classes of stock, however, only one is expected to yield a copious measure of milk beyond the needs of its offspring—that is, the dairy cow. Originally, all classes of cattle had much in common, it is supposed, but with the growth of civilization men developed cattle according to their needs, and as a result two great groups of this stock became gradually established, viz., the beef type and the dairy type. The latter was created as a result of the needs of men for milk and butter rather than for calf consumption. To-day, the calf in a well managed dairy herd is removed from its dam within 24 hours of birth under ordinary conditions, and thereafter is entirely deprived of the great comfort of sucking its dam, while the beef calf may suckle for six or nine months, as the case may be. The modern dairy cow has evolved into a great milking machine, with a capacity to produce that is truly marvelous. Careful study by men interested in dairy cattle, seems to demonstrate that there is a type of this class. Not all good milkers represent this type, but undoubtedly to a more or less degree many of them do. The fact that an occasional animal that widely differs from the type produces milk in abundance, should not affect the importance and truth of the statement, that the type really does exist, and has a significance. What is this dairy type? While many may be familiar with it, the writer will take the liberty of discussing the subject for the benefit of others.

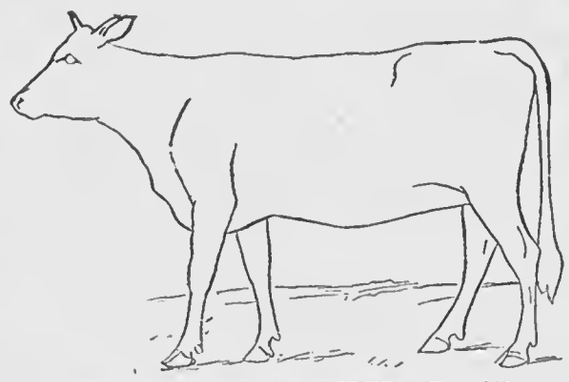


SHAPE OF A DAIRY COW. FIG. 224.

CONSTITUTION.—I have before this said something about constitution, that all important feature of life. With the beef type a square, full chest is sought for, while the dairy type is of less diameter through the shoulders or between the legs at base of the chest. The front legs should not be close together, so that the knees almost meet, but the legs should drop rather straight to the ground, with considerable space between them. Then the chest should appear rather deep, and be well sprung out behind the shoulders at the point marked "crops" on Fig. 224. On dairy cattle this point usually is more depressed than on beef cattle, but it is none the less desirable to have a well-sprung body here, for this part covers the vital organs, and so requires plenty of chest room. Consequently, from the withers on top to the brisket below should be depth, with ample diameter between.

THE WEDGE SHAPE.—Instead of putting her food into flesh, the typical dairy cow converts what she does not require to sustain life, into milk. And so, if of the right sort, she will be more lean, muscular and angular of outline than the butcher most enjoys. She should not look emaciated, but her muscles must be visible, and her ribs just slightly so. A cow thus lean, of the dairy type, presents a general conformation rather peculiar to herself, which modern dairymen have taken to terming "wedge-shaped." If one views such a cow from one side, he will notice that there is a greater depth from over the hips to the under side of the udder, than from the withers to the body between the front legs, thus indicating a tendency to wedge shape. If one stands in front and views such a cow, it will be noted that she widens out from front to hind quarters, giving the wedge form from this point of view. Again, if one stands over this type, and looks down, he will note that the back is narrow at the withers, and gradually widens out in wedge form for half the depth of the body in front. Consequently, the reader can see this wedge form, as it were, by viewing the best type of dairy cow from various points. Fig. 224 shows something of this wedge form, while Fig. 225 does not. Young animals, however, do not have this development to any such extent as do mature ones. With age and pregnancy the body changes form, and this wedge form becomes more pronounced. Fig.225 more represents the form of the yearling heifer.

SHAPE OF UDDER.—Many may think the udder and its accessories the most important part of a dairy cow, this being the "business end," but the constitution and general outline or form, I think, should have precedence, just as much as the foundation and general form of a building are of greater importance than the specific use it is to be put to. The udder of the dairy cow, however, largely measures up the value of an animal, and so great emphasis must be given to this point. A cow of the best dairy capacity will be a large producer, and so she should be gifted with strong constitution to endure the strain. In my opinion, the best type of udder, when viewed from one side, should be well developed in front along the belly, and carried up behind with a full curve, so that the entire outline of the udder will extend outside rather than inside the curve of a circle. To illustrate this, the front of the udder shown at Fig. 226 is carried straight along against the belly, with the two sets of teats nearly on the same level. This represents a very high class front udder, a



TYPE OF YEARLING HEIFER. FIG. 225.

part of this organ which is very generally defective. Fig. 227 represents a too-common form, where the front udder is abbreviated, so that the front teats are suspended or hung considerably above the hind ones. This is a very inferior form. As the reader can see, the front udder in Fig. 226 passes outside the line of a circle, while that of Fig. 227 is well within the line. The front udder is the more generally defective part, and so most score cards of dairy cattle attach a greater number of points to the front than to the hind part, owing to its natural weakness. When a cow is standing in a natural position, and she is not too far advanced in lactation, and her udder is fairly well filled with milk, then the outline of the hind part should curve up perceptibly beyond the leg towards the vulva, and the higher up the better.

WHAT IT IS.—The udder consists of two glands lying side by side, held to the belly by a suspending muscle as it were, passing down between them. These glands lie here like two big beans side by side. Each gland, however, is separated into two halves, forming the two quarters on each side. If one places his hand under the udder he will note a groove between these two glands, passing lengthwise of the animal. Now a well formed udder will not have a very deep groove, but the two glands will combine to form a thick udder, which will always be thicker in front than behind. Just before being milked the udder should be graceful in side outline, thick through, and of good depth.

In its interior composition the udder is like a sponge, filled with holes in which milk is deposited and held. After the cow is milked this udder should shrink and become somewhat "wizzled up," losing its most graceful form. If it does not do this, then it is what is termed a "meaty" or "fleshy" udder, and will be found lacking in capacity to yield milk in proportion to its size. The teats should be placed well apart, so as to permit milking with ease, and a length of 2½ to three inches is to be desired, as representing the most convenient size for handling. Associated with the udder will always be found at least two or three so-called "milk veins." These extend from the front of the udder, one on each side on the belly, and pass forward with more or less twisted movement perhaps for one-third or half way to the front legs, where they disappear through a small aperture known as the "milk well," into the abdomen. The length, size and twist of these veins differ. One may at rare intervals see a milk vein extending the entire length of belly, and disappearing at the arm pits. Again, these veins may be very small and with few curves, or they may be large and well twisted and most noticeable. Young cows have less conspicuous veins than do more mature ones, the same as the veins on the hands of young people are less conspicuous than those of persons of age and maturity. A large, long, twisted milk vein is considered an indication of good milking capacity. If this vein passes into the abdomen through a large milk well, it is more to be desired than entering through a small aperture. Between these two large veins, which pass along the under side of the belly, as one might say, at the margins, will often be found a third and shorter milk vein. Sometimes the space in front of the udder for a short distance, and between the two large milk veins, is covered with a network of veins. This is rarely found, however, and then, as I believe, only on cows of great milking capacity. Besides this, veins will be occasionally seen on the exterior of the udder.

C. S. PLUMB.

Leg and Body Wash.

Race horses often become sore and stiff from continued strain on the hard tracks. Nothing takes out this stiffness and soreness like a wash compounded of diluted

Tuttle's Elixir

apply to the legs and put on light bandages. Sponge the body and put on light blanket. Guaranteed to produce desired results or money back.

Readville Trotting Park, Mass., March 23, 1900.

Dr. S. A. Tuttle, V. S.

Dear Sir:—I have used your Elixir for the past ten years, in the diluted form for a leg and body wash. I consider it the best wash for keeping horses from soring up. Horses done up with this wash are much less liable to take cold than when done up with witch hazel or any other wash I ever used. J. H. NAY.

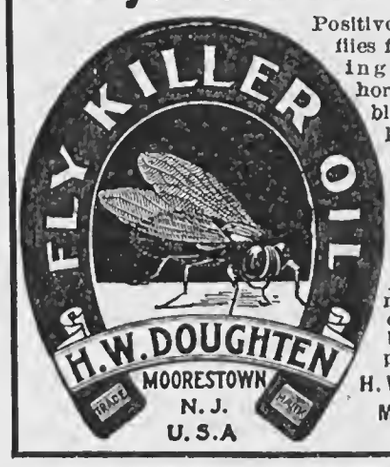
LUMP JAW
Easily and thoroughly cured. New, common-sense method, not expensive. No cure, no pay. FREE. A practical, illustrated treatise on the absolute cure of Lump Jaw, free to readers of this paper.
Fleming Bros., chemists, Union Stock Yards, Chicago, Ill.

Death to Lice on Hens and Chicks. 64-page Book FREE.
D. J. LAMBERT, Box 307, Apponaug, R. I.

ZENOLEUM Kills Lice, Ticks, Mites, Fleas, Etc., on all kinds of animals and poultry. Given internally it drives out worms. Cures all cuts, wounds, sores, etc. Non-poisonous. Endorsed by leading veterinarians. "Veterinary Adviser" free. Zenner Disinfectant Co. 100 Bates St. Detroit, Mich.

SHOO-FLY The Animal's Friend
Kills every fly it strikes; keeps off the rest. Harmless to man or beast. ½ cent's worth saves 3 qts. milk and much flesh. Send $1.00 for Improved Sprayer and enough Shoo-Fly to protect 100 cows, or 25 cents for liquid alone. Guaranteed
SHOO-FLY MFG. CO., 1005 Fairmount Ave., Philadelphia, Pa.

Make your Cow Comfortable



Positively prevents flies from annoying cows or horses; rids stable of flies, keeps stock good tempered and in fine condition. A boon to every stock owner. Apply to your nearest dealer or write for booklet and prices.
H. W. Doughten, Moorestown, N. J.

THE FULL MILK PAIL
attests the value and is the sure result of the use of our
NEW CENTURY FLY KILLER OIL.
There is no "fly time" where it is used. Absolutely safe—harms neither man nor beast and will not taint milk. It is most evenly and cheaply applied with our Special Sprayer. Calves and young stock can't thrive and grow if continually fighting flies. It's equally valuable for horses. Prevents "fly nervousness" and has saved many a "run off" and "smash-up." Ask your dealer for it. If not there, send $1.00 to us for Sprayer and enough Killer to protect 150 cows or other animals. We are the sole manufacturers and want agents everywhere.
D. B. SMITH & CO., UTICA, N. Y.

FARM AND DAIRY NOTES.

A GOOD SILO.—Without boasting we have the best round stave silo it has been my privilege to see. I described it in THE R. N.-Y. last Winter. The special features were thick staves to prevent freezing, hooped with steel wire rope, ½-inch, and the doors hung on the outside, swinging out instead of in. The thickness, 2¾-inch, quite prevented freezing, and it is pretty cold in Lewis County. The wire cable resisted the extreme cold without breaking, and the silage was just as good next to the doors as it was anywhere. The doors swing on heavy hinges fastened with an ice-box fastener or clamp. No one has disagreed with me who has seen this silo.

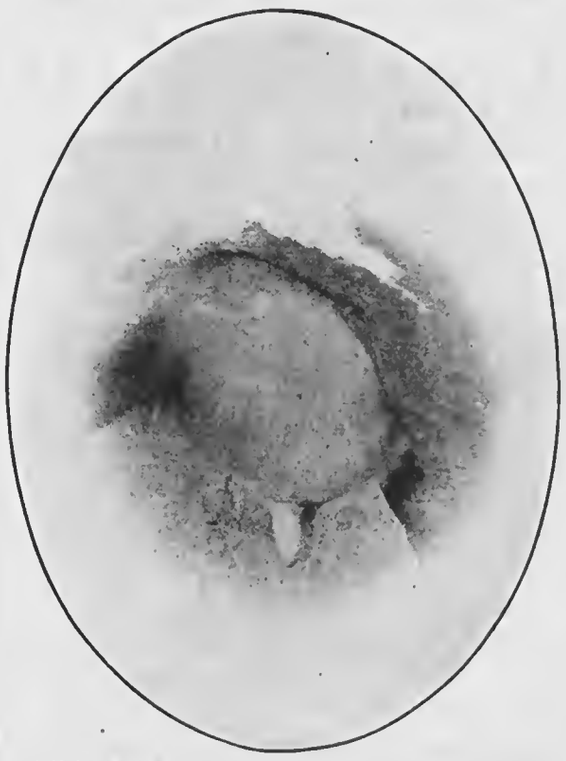
USE MORE MILK.—It is a prevailing custom among farmers in my observation to be very careful in the consump-

SQUARE AND LEVEL UDDER. FIG. 226.

tion of their money crop. The milk farmer is very sparing in the use of milk. The producer of cheese eats comparatively a small amount. In the butter dairies the same rule is adhered to. The fact, is, we need education in food values. I have many times lessened the amount of milk my wife asked me to get for the day's use—just a little you know. It lessened the day's record at the weigh can. Now I think how foolish. Prof. Atwater found it required .28 pound of protein and 1¾ pound carbohydrates for a working man each day. I had not come to realize a great economic law—that our milk was sold at wholesale, and everything purchased was bought at retail, or at the best a semi-wholesale price. Compare a dressed beef with milk, which contains 14.7 per cent refuse and 51.2 per cent water; total 65.9 per cent, leaving 34.1 per cent solid matter. Probably nine cents would be a fair retail price for a whole beef in city, town and country. This price would make the solids in 100 pounds worth 26.4 cents per pound. The average price of milk would not exceed five cents a quart, or on a basis of 100 pounds we should have 13 pounds of solids, or 46 quarts, selling for $2.30, or 17.7 cents for a pound of solids, a saving in favor of milk of 8.7 cents per pound dry matter. In other words, milk would be as cheap at seven cents a quart as an entire beef animal at nine cents a pound. We must supply the .28 pound of protein and 1¾ pound carbohydrates from some source. Why sell milk at two cents a quart, an average wholesale price to the farmer in crude milk and manufactured products, and buy beef at nine cents? Let us reverse our figures. Milk at two cents a quart is equivalent to beef at 2.28 cents a pound for an entire carcass. We have not considered the greater digestibility of milk. The average consumption of milk is less than one-half pint per capita. Why not use more milk?

FINANCIAL PROBLEMS.—When one has an ambition to do, and finds himself handicapped by inability to adjust and arrange the finances of the business, what is he to do? In my own case there are three elements that have to be curbed or spurred to keep them working. They are ambition, the actual necessities of the case, and funds to operate with. I wonder whether any of THE R. N.-Y. readers are ever thus abridged, and have to call a halt to take latitude and longitude. It is just as necessary on the farm as on the ocean; to keep a proper equilibrium is no easy matter. To illustrate: For several years the gray matter of improvement has been in the ascendency; new buildings, repairing, painting, cleaning up old hedgerows and work of that nature, that did not add very materially to the producing power of the business. Over a mile of stone wall along fences has been cleaned up, bushes pulled out and the land cultivated, until what formerly was of no value is now producing crops. The income may not be large, but it looks better. A man may be fed through the eyes as well as through the mouth, as is proven by the rapid increase in the growth and sale of flowers in this country. In 1800 there were three commercial florists; 1850, 300; 1880, 2,000; 1890, 5,500, and last year $20,000,000 was expended for flowers. A bouquet of flowers on the table will aid digestion. These improvements have had the same effect.

TO-MORROW'S RESULTS.—It is right here that the secret of success is found. The results of to-day are not the means of yesterday. The profitable dairy cow was bred five years ago. If she is unprofitable it is then too late to change the cause. Don't you think farmers do not do as well as they would if results could be seen immediately following the cause? The thorough protracted cultivation of a field shows perhaps more on the succeeding crop than upon the one just planted. Another thing not generally considered or practiced, if known, is that the same labor spent harrowing a piece of land over a period of two weeks will be more effective than if put on in a single week. The old Summer fallow abundantly proved the advantage of protracted cultivation. Nitrification, and the dissolving of plant food from the minerals of the soil could not take place



FRONT OF UDDER DEFECTIVE. FIG. 227.

in a moment. Everyone knows the action of air and moisture on vegetative matter, bringing on rapid decay. Stirring the soil does the same for the humus it contains, and the value of a soil after all depends upon its humus content. It has been interesting to note the condition of soils in different sections. The soils of northern New York, as a rule, are not deficient in humus. It is a dairy section, which means that most of the vegetation is fed upon the farm. The long Winters, with snow and frost, have their advantage, unlike the New Jersey soils lying exposed a greater portion of the year, subject to heat and rains. The New Jersey farmer who does not supply a cover crop is losing money. I was interested last Winter in the repeated question why the oats did not do well. Prof. Voorhees finally came to the rescue, saying that their soils had been exposed so long that the readily available nitrogen needed by the early growing oat plant had been lost during the Winter, and there was not time for heat and moisture to create more of this necessary ingredient until it was too late for the oats. Cultivation is the great want in snowy, frosty sections, and cover crops where land is open. It is my observation that this distinction has not been made either by the institute workers or the agricultural writers. H. E. COOK.

INCREASED PENALTIES.—Last Spring THE R. N.-Y. referred to the penalties for violating the agricultural law in New York. Too many cases were being quietly settled by lawyers in the civil courts. The following from the New York Produce Review is encouraging:

Just before the end of the last session of the New York Legislature a change in the penalties for violation of the State agricultural law was quietly made—so quietly that few people knew anything about it until the amendment had become effective as a part of our statutes. Formerly the minimum penalty for violation was $25 fine for both civil and criminal cases, and the officers of the Agricultural Department were hampered somewhat in the prosecution of oleo cases by the smallness of the fines often imposed. It was through their efforts that the law was amended so as to enforce a greater penalty and make the breaking of the law a more serious matter. In criminal cases for the sale of oleomargarine colored to imitate butter, the minimum penalty for first offense is now $50 and the maximum $200, while for the second offense the minimum penalty is now six months' imprisonment. In civil cases the minimum fine is now $50 for the first and $100 for the second offense. Most of the actions against oleo sellers are brought in the criminal courts, and the increase of minimum penalties will doubtless be of assistance to the authorities in discouraging violations.

CHILDS'
SO-BOS-SO
KILFLY
COWS Will GIVE FROM 15% TO 25% MORE MILK
and Better Milk if Protected from Flies by the use of CHILD'S SO-BOS-SO KILFLY.

It is a thorough fly killer and germicide, it destroys all bacterial germs, insures health, greater strength and vigor to the animals and by the absolute relief afforded to them increases the amount of milk $8.00 to $10.00 per cow during the season you will find it the best investment you ever made.

It allays nervousness in horses as well as cows and keeps both in better general condition. As an antiseptic and for scours in calves, hog cholera, swine plague and foul in cattles' feet it is unequaled and may be used either in the stable, cow shed, chicken house or pig pen.

It is easily and rapidly applied with Childs' Electric Sprayer, and a herd of 30 to 50 cows can be sprayed in a few moments. SO-BOS-SO is absolutely harmless to man and beast.

Abortion in cows, which is caused by a germ—propagated by unsanitary conditions—can be prevented by the use of SO-BOS-SO KILFLY.

Sold only in gallon cans. Ask your dealer or send $2.00 for one gallon can and Electric Sprayer complete, securely packed and express paid to any point east of the Mississippi River except State of Maine.

The Sprayer can also be used for spraying potato vines, bushes, trees, etc. Beware of imitations.

CONVENIENT. CHEAP. PRACTICAL.

Thousands are in use in America, Canada and Mexico. Shipments have begun to Cuba, the Philippines, South America and Australia.

LENOX, Mass., April 21st, 1900.
I have used So-Bos-So Kilfly with good results. It is a comfort to both man and beast at the milking time. JACOB STEIBEL,
Supt. to the Hon. John E. Parsons.

PHILADELPHIA, PA., May 2, 1900.
Last July the daily quantity of milk produced by my Chester County Dairy fell off very considerably, which I attributed to the annoyance which the cattle received from the flies. About half the time the herd was standing in a stream switching instead of grazing. I ordered a sample of So-Bos-So Kilfly and by having it applied every second morning, greatly relieved the herd and increased the milk product from 15 to 25 per cent, and I have continued to use So-Bos-So Kilfly during hot weather ever since that time. Our herd of about twenty head could be sprayed in the stable in less time than it would require to milk a single cow, and I consider that I saved many times the cost of the So-Bos-So Kilfly used in addition to affording comfort to the herd. G. S. W. BRUBAKER.

LENOX, Mass., April 23, 1900.
We used So-Bos-So Kilfly last summer, on cows and horses with excellent results, it being much more satisfactory than anything else of the kind we have ever tried.
A. H. WINGETT, Supt. Allen Winden Farm.

CHAS. H. CHILDS & CO., Sole Mfrs., 12 LaFayette St., UTICA, N. Y.

LESS Than DEALERS PAY

Our Price to You is $7.25

This is a sample of our Furniture prices. Here is a Couch which the factory sells to your dealer at about $8.00. Your dealer will charge you not less than $10.00 or $12.00 for a couch of equal grade.

Order No. R41.

Price, $7.25

State color of plush preferred.

An unusually large, luxurious couch, made of selected oak, or, if preferred, in mahogany finish, handsomely carved throughout and supported by massive carved claw feet. It has six rows of deep hand-made tufts, fastened with the celebrated steel tufting buttons which cannot pull off or pull through the cover

It is well filled and contains the best grade of steel springs turned from special high-carbon wire, over which is placed heavy duck canvas instead of the burlap commonly used, the best grade of figured velour plush in all the staple colors being used for upholstering.

From a sanitary point of view the open bottom presents a special feature. It allows good ventilation and a free circulation of air, which is disastrous to moths and germs.

The frame is massive and substantial, the workmanship first class, the appearance neat and artistic—a good, serviceable couch at the lowest price ever offered. Size 30 inches wide, 78 inches long. Weight 100 pounds.

We do not care to ship goods unless freight charges are guaranteed. If you do not wish to send the full amount, $7.25, send us $1.00 to show good faith, and we will do the rest. If you really think that you ought not to take even this risk, write us and say that you prefer to have the couch shipped C.O.D. and that you will pay the full amount upon arrival and examination.

We want to be reasonable from every point of view. It may be returned at our expense if not satisfactory. Send us your order now; do not wait. Order *No. R41.*

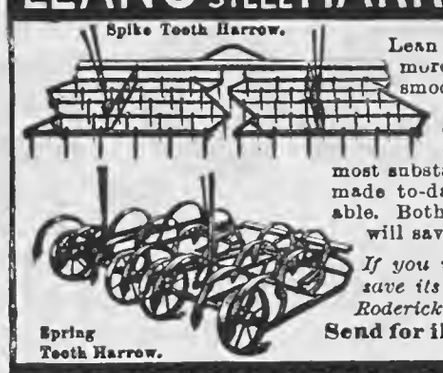
Send for Circulars.

LEAN'S ALL STEEL HARROWS AND LAND ROLLERS.



Lean harrows make fat harvests. They do more work and do it more efficiently than any other harrow. They tear up the ground, smooth it for sowing, harrow in the seed, kill the weeds after the crop comes up. The teeth are adjusted to suit any condition of the soil. By a touch of a lever they are instantly cleared of trash without stopping the team. The most substantial and finest finished farm implements made to-day. Made entirely of steel, light and durable. Both the spiked tooth and spring tooth harrow will save enough in a year to pay for itself.

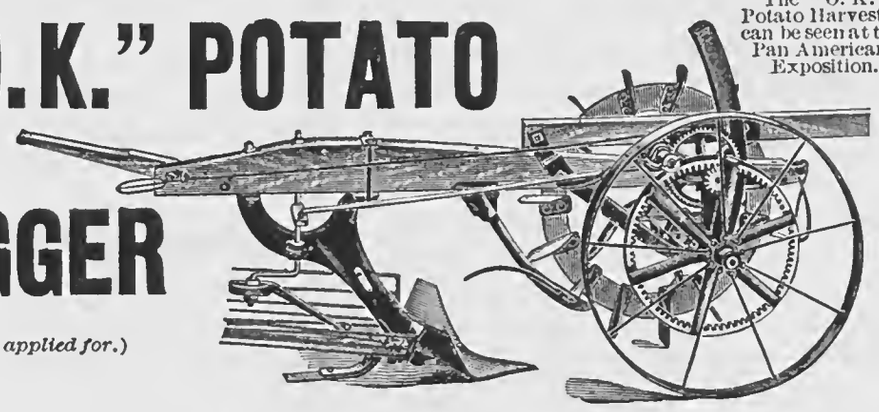
If you want a Land Roller that will save its price in a single season, get a Roderick Lean Steel Land Roller.

Send for illustrated catalogue to-day.

RODERICK LEAN MFG. CO. MANSFIELD, OHIO.

"O.K." POTATO DIGGER

(Patent applied for.)



The "O. K." Potato Harvester can be seen at the Pan American Exposition.

Sent on trial. Test it in your own field. If it does the work, pay for it. If it fails, reject it.

We want a good, live, hustling man in each township in potato section to take orders. One who has a good team and can and will spend time enough between now and digging time to call on every farmer in the township who grows five acres or more. **We Pay Liberal Cash Commission.**

SELECTING A DAIRY COW.

What to Look For! Where?

PART II.

While it does not always indicate a fine dairy cow, still a mellow, thin skin, elastic and unctuous to the touch, and covered with fine hair, is usually an indication of quality. The best dairy cows must possess quality, and the skin and fine bone show these features in a fairly accurate manner. Long, coarse hair, and thick, stiff hide are most undesirable. One should be able to grasp the skin in the hand along the front of the body near the shoulders, and pull it easily from the body, and almost wrap the hand in it, if of the mellow sort desired. If it hangs tight to the body, it may show lack of condition, or will indicate poor quality. This applies to the skin over the udder as well as to the rest of the body. People sometimes ask for indications as to quality of milk. Most dairy students desire a yellow pigment to the skin, which is most readily seen by examining the interior of the ears, or is perhaps seen in the lower part of the horns. This is not always a correct indication, for I have seen a Holstein with good color producing a very low grade of milk.

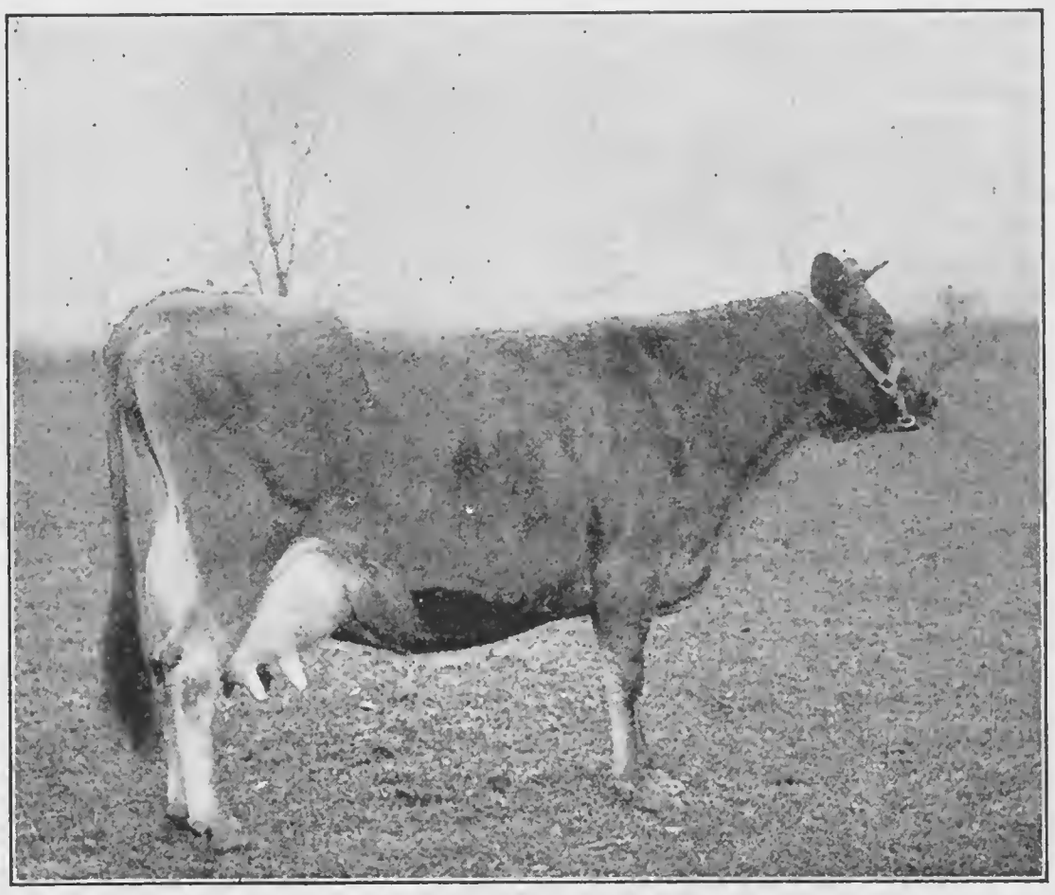
As one stands behind a well developed dairy cow, the hind legs should come to the ground in good position, with considerable space between the hocks. A cow of say 1,000 pounds weight would do well to carry her hocks six inches apart at the least. The purpose of this is to allow ample room for the suspension of the udder between the legs. If the animal is what is called "cow-hocked," then the hocks come together and the toes turn out, and a cramped, ungainly rear part results. The thighs of this dairy cow should also be thin and not fleshy, thereby permitting a width of the udder in its upper part that is highly desired. Legginess is also undesirable in the cow. The appearance which we admire in her should always be indicative of her fitness for the work we expect on her part.

There are other features in the dairy cow that might be touched upon, but already the writer has covered these in other articles. There is always the desirability of the broad, level back and splendid spring and depth of rib, with large body capable of great feeding capacity. The dairy cow is somewhat longer bodied than the beef type, and has more space between the ribs, and greater space from hip to rib than the beef cow. She also has a longer, thinner neck and leaner head. She, however, does not materially differ from her sister in the need for broad, full forehead, bright, placid eye, broad, strong muzzle and full cheek. Of recent years considerable emphasis has been placed on the "nervous temperament" of the dairy cow. All animals of a lean character are naturally more nervous than those of a fleshy type. The Leghorn hen is more nervous than the Brahma, the Merino sheep than the Shropshire, the Yorkshire pig than the Poland China, or the Jersey cow than the Short-horn. But nervous type need not mean uncontrollable or excitable. If intelligently handled, a dairy cow will be placid and quiet, although it does require nervous force to produce such immense quantities of milk as a good animal may. And so a strong, prominent spinal column or backbone, indicating great nervous force, should not be looked on with disfavor. In any event it will usually be found with the high-class dairy cow.

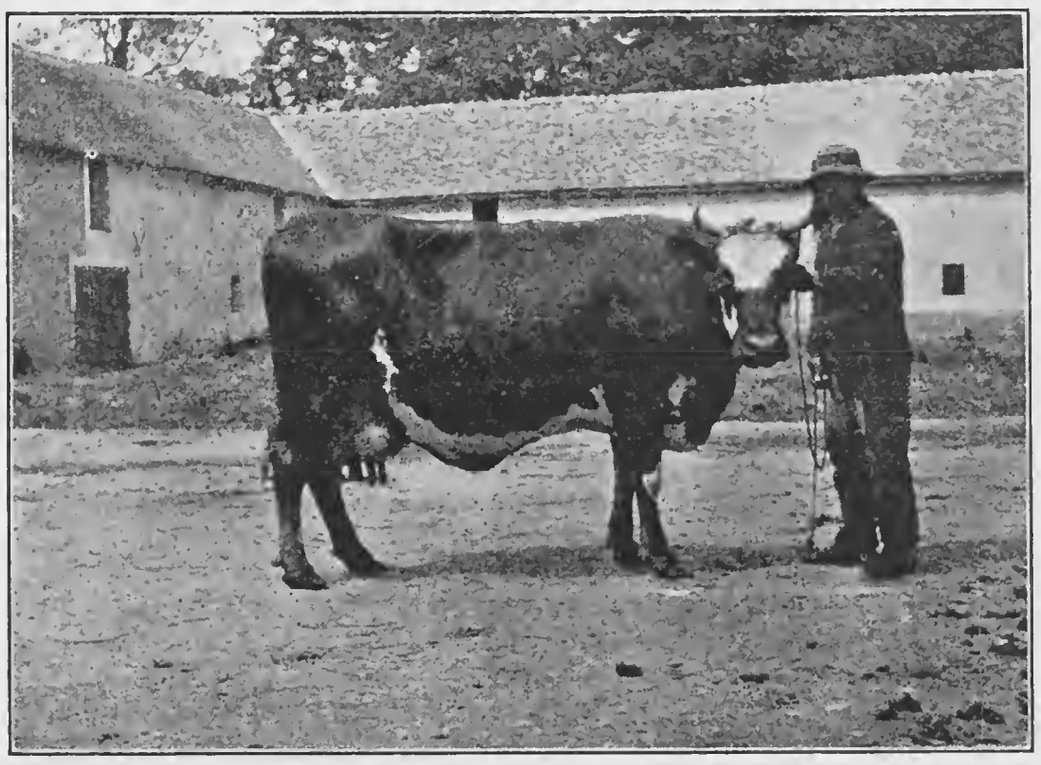
How much ought a good dairy cow to produce? I should qualify that by age and breed. Animals of the smaller class, such as Jersey, should yield after the first calf at least 4,000 pounds of milk of five-per-cent quality, and after that at least 5,000 pounds. This within 12 months' time. Cows of the Holstein-Friesian type should make at least 6,000 pounds of 3½ per cent milk, with 8,000 pounds in mature form. Ordinarily, the more milk a cow gives the poorer it is in fat-producing quality, to a certain extent.

In connection with this article I submit two pictures of cows that I have had the pleasure of handling, that represent very striking specimens of dairy animals. Fig. 228 is of the Jersey cow Silver Sheen 26210, who in the hands of Col. A. T. Dempsey, of Columbus, Ohio, became well known as a very beautiful show cow. She had great quality, her form was of a rare sort, while she carried an udder of the kind that at once caught the eye for its superior form. The front of this might have been improved by being carried forward somewhat, but it is none the less a good one. The picture shows the prominent veins on the udder and abdomen. Last year, when visiting M. Victor Gilbert at Wideville, France, I came on a Normandy cow in his stable, among numerous others, that to me was a remarkable specimen. She is shown in Fig. 229. This cow represents an animal with a wonderful body capacity. The picture does not bring out her great back and spring of rib and body as I wish it did. She had a large udder, that I judge was of much capacity, with very prominent milk veins. I think I have never seen quite so striking a dairy cow in America in the large proportion of body and udder, to the small proportion of legs and neck. Victor Gilbert is perhaps as great a breeder of Rambouillet Merino sheep as France affords, but he certainly knows a good dairy cow. Perhaps these suggestions may be of service to some of the uninitiated, who desire more information concerning dairy cattle. I at least trust so.

C. S. PLUMB.



JERSEY COW SILVER SHEEN 26210. FIG. 228.

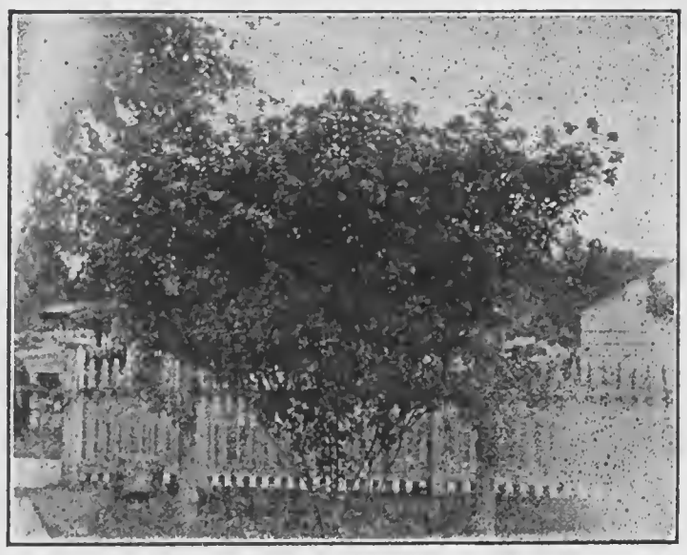


A NORMANDY COW. PHOTOGRAPHED IN FRANCE. FIG. 229.

"GUARANTEED EGGS."

The Monmouth Guaranteed Egg Company, a New Jersey enterprise for the production of fancy eggs of guaranteed freshness, is building an elaborate plant for its operations near Manasquan, Monmouth County. A prospectus issued early in the year stated that $50,000 would be expended in equipment, and when in full operation 2,000 eggs a day would be delivered in New York, guaranteed to be not over eight hours old. A representative of THE R. N.-Y. visited the plant recently, and found a fertile and well-tilled 87-acre farm lying a mile west of the pleasant old village of Manasquan, and within 15 minutes drive of the surf of the Atlantic Ocean. It is a prosperous locality, with an excellent train service to New York and Philadelphia, the former being reached in less than two hours by several express trains every day. The greater part of the farm is now in grass and pasture. A brooder house 24x150 feet with incubator room 22x30 feet, has just been completed, and is evidently well designed and thoroughly constructed. By using a special legless pattern it is thought 50 incubators may be operated at once by placing them in several tiers about the room. Long ranges of laying sheds are staked out through the fields. A considerable number are finished, and the framework of many more is under way. An old apple orchard on the place will furnish shade for the chicks, and a young plum orchard is to be planted for an increased run. An elaborate system of yards isolates the laying houses, which are built for the accommodation of 25 hens each. Water will be supplied by windmills, and later steam pump. Intensive feeding for egg production only is the central idea, as only the cockerels and old hens will be sold from the place. One of the chief promoters of the enterprise is an architect as well as a successful chicken fancier, and it is plain the constructive work has been intelligently planned.

No fowls are yet on the place, though purchases are now being made of young stock. Only Brown Leghorns and Black Minorcas will be kept, the plan being to cross these breeds for the production of uni-



A CRIMSON RAMBLER ROSE IN ILLINOIS. Fig. 230.

form large white eggs. There is every reason to believe that an earnest attempt is being made to solve the problem of wholesale egg production, and THE R. N.-Y. will watch the outcome with much interest. So many big egg projects have failed that chicken men are naturally sceptical, but it is within the range of possibility that the managers of the Guaranteed Egg Company may solve the problem. There is no doubt that they can dispose of a vast number of such eggs as they plan to produce at rates above market quotations, as they have been tendered contracts by some of the largest hotels in New York, but the gist of the matter is whether they can keep so many hens healthy and happy through a profitable laying age. There is no evidence to show it has yet been accomplished on a really large scale. The immense proportion of eggs sold are produced by hens that run at large under almost natural conditions, and the writer has long thought that poultry products are too low in price, and scarcely pay cost of production if labor and materials are estimated at their real value. The fact that in thousands of small flocks running practically at large the hen rustles for most of her food, which would otherwise remain ungathered, and performs the major share of her own work, accounts for the supposed profit attributed to poultry keeping. THE R. N.-Y. will keep its readers advised of the results of the new egg enterprise. W. V. F.

AN EXPERIENCE WITH GRASS SEEDING.

On September 19, 1900, I put a lot, 200 feet square, into grass by the Clark method, at a total cost of $30.03 for the plowing, cultivating, fertilizers, seed and seeding. We sowed 14 quarts Timothy, 14 quarts Red-top and four quarts Medium clover on the 40,000 square feet of ground. This is not quite one acre, as you know. The lot is good limestone soil and naturally grass land. In 1899 we raised 2,051 pounds tobacco leaf, that we sold for $153.82, and in 1900 we raised 1,903 pounds that we sold for $152.24, on this piece of ground. I mention these tobacco facts to give you an idea of the condition of this lot. The grass crop was put in very carefully. The cultivation was so thorough that the lot was as fine and even as it was possible to make it. The ground was plowed and rolled, when rather dry, about September 10, and 90 bushels of air-slaked lime spread evenly over it. We then waited for rain that came in soaking showers on Saturday, September 15. By the Monday morning following the ground was in first-class condition for the spring harrow and land roller. We went over it alternately so frequently with these implements that the lot looked like a big garden. Then we further fertilized it with a mixture of 480 pounds fine-ground animal bone, 160 pounds nitrate of soda and 160 pounds muriate of potash. After the cultivating and fertilizing was so thoroughly done that I was sure Mr. Clark himself could not exceed it, the seed was sown. The sower started early in the morning of September 19 and finished about 6 P. M., after working at it faithfully the entire day. No man in the State could have cast that seed more evenly and regularly. In due time the seed sprouted and the grass came up beautifully, and continued to grow nicely and evenly until the ground froze.

In the Spring the grass made an early start to grow; but I soon saw that the clover and Red-top were being crowded out by the Timothy. During May we had wet, cold weather, and the grass commenced to go down in spots. By June 24, when we cut it, it was all lodged and damaged, by being down too long, and not drying on the ground. The grass stood much too thick on the ground to give a good yield of first-class hay. We took off 6,310 pounds of hay that I sold for 50 cents per hundredweight, yielding me gross $31.52, or net on the cost of putting the seed into the ground $1.52. I expect to mow the lot once more this season, as the grass is sprouting out nicely now. I may report any further yields. I think that for our soil I used too much Timothy seed. I believe that seven quarts of Timothy seed with the Red clover and Red-top, sown last Fall would have made me more and better hay. There was nothing to cut but Timothy, and it stood so thick that its stalks could not develop. It was down in all directions from sheer weakness of the stalk. When the Timothy went down it ceased growing, and thus did not average more than 24 inches in length. If this grass had stood less thick on the ground it might have averaged 48 inches in length. It then might have yielded five or six tons of prime hay. I believe that Mr. Clark raises the quantity of hay per acre he claims, but I also believe that if he had my land and would understand it as well as he does his own, he would sow less Timothy seed to the acre than he recommends. In the future I would consider seven quarts Timothy an ample sufficiency for an acre of our land. I think a novice would better not put out too much grass by the Clark method, until he has tested his ground thoroughly. G. A. R.

Wrightsville, Pa.

CONDITIONS IN THE SHENANDOAH VALLEY.

In reply to your inquiry as to value of land here compared with 20 years ago, I do not think that it will be unsafe to say that it is lower now. There is so little land changing hands—almost none except compulsory sales, and it is noticeable that farms thus sold have to be put up at the court house door two or three different times before they are allowed to go. Men used to rent here for years, and then would be able, from the profits of their toil on the farm, to buy a farm and, in a few years more, buy another and so on; but nothing of that kind is seen now. Most of the farms are sold to town men who have money which

PLACING THE BLAME. Fig. 231.

Bossy (to the Baby): "No, there wasn't a bit of anything bad in that milk when it went to town; nothing but what was good for little children. If it wasn't up to grade, you'll have to get your father to watch the city dealers."—Chicago Record-Herald.

they must put somewhere, and while investment in farms does not give any six per cent return yet it is safe and under their eyes. We are in the northern end of Shenandoah Valley—good land; staples, corn and wheat. These have been too low of late years to pay. Wheat has started now at 60 cents, though drought in the West may make better prices here. I am not a farmer originally. I spent my active life in the Presbyterian ministry—broke down 20 years ago in my voice, and had to go out of doors. Got my father's old homestead, have nearly 200 acres, and set out (15 years ago) a good-sized apple orchard and have since put greater part of the entire tract in same. Two years ago I was offered more than double what I paid. This will answer your question about cause of increased value of any land here. A great deal had been set in orchards, but there is only a portion of the country here that is adapted to apples especially. Lands are down here. Had your question been as to value compared to 40 years ago, or rather before the war, when values were staple, I could easily have told you there has been a tremendous slump; from two-fifths to one-half less now than then.

The farming interests are the great interests—the source of our welfare—occupying the attention of probably more of our toiling people than any or all others; and this state of things—the impoverishing of the agricultural people through the shrinkage of farm values extends over a period of the alleged greatest prosperity the world has ever seen. A few families and corporations, certain lines of business favored by the Government that claims to treat all alike, have grown rich beyond belief; but their wealth has been sucked from the farming people very largely, as seen in the shrinkage of value of farms which once made the farmer an independent man and his occupation one that young men sought after. Today all want to go to the cities and get rich fast.

Gerraldstown, W. Va. S. H. M'K.

CRIMSON RAMBLERS; YARD TRIMMING.

One of the prettiest things in the season of pretty things is a well-trained Crimson Rambler rose. I send a picture, seen in Fig. 230, of one in the yard of A. M. Leslie, Christian Co., Ill. When the picture was taken the plant was a mass of brilliant crimson bloom, actually thousands of roses on it. It is four years old, and is trained on a strong trellis about eight feet high and 10 feet long, and the picture shows how it was covered. It truly was a vision of loveliness. This plant shows what a little—a very little—time and attention will do in the way of ornamenting a yard or lawn. After the trellis was built Mr. Leslie probably did not spend over two hours in a year on the training of this rose. He merely attended to it at odd moments, when it needed a little attention. He is one of those men who have a knack, not natural but acquired, of getting the most out of everything he plants. This knack consists of nothing more nor less than doing everything at the right time—attending to a thing when a minute counts for more than an hour later. And that really is the whole secret of success with anything, especially anything that grows. Many a farmer thinks he cannot have a pretty lawn or "door yard" because he cannot afford the time he thinks is necessary to attend to it, when in fact all that is needed is a few minutes each day. A snip here, a bit of string there, a tack, a hack, a wrap and a pinch after supper or before breakfast, and a hard, unsightly place is transformed into a bower. One can have these things if he wants them. The main question is, Does he want them?

Illinois. FRED GRUNDY.

PIGS IN THE PEACH ORCHARD.

If P. E. S., in THE R. N.-Y. of July 20, page 511, read my advice to pasture hogs in an orchard with both eyes open, he must have seen that I only advised pasturing an apple orchard. Under no circumstances would I allow a peach or plum orchard to be seeded for pasture at any age. In my experience and observation one may just as well pull out and destroy either a peach or plum orchard, especially the peach, as to neglect the cultivation even for a single year. Peaches and plums are both gross feeders, and in order to have them bear regularly and produce fine fruit they must be not only fed liberally, but *must* be cultivated. I cannot endorse Prof. Plumb's advice when he says: "Still if the orchard is a year or so in clover and the stubble plowed under the trees should be much benefited." A worse thing could not be done than to sow a peach or plum orchard to clover and leave it for even a single Summer, unless it be to leave it two Summers, but one will be enough to ruin it.

By all means keep the orchard under cultivation. It is all right to give the hogs the run of the orchard, and while ordinarily they will not bark the trees, provided they have plenty to eat and plenty of water to drink, they will sometimes, even when well fed, get a taste of the bark, and then soon ruin the orchard, so the only safe way is to protect the trees, especially if small. But it is not safe to put tin or any other thing that excludes the light, about the bodies; the shade is sure to injure the bark, and may cause the death of the trees. Use wire netting, chicken wire with a two-inch mesh, and be sure to have it three feet high. They will eat above a two-foot wire. Put it loosely about the tree and twist the ends of a few wires together and it will stay until the tree outgrows it, which it will do very soon if well fed. The only admissible way of seeding a peach or plum orchard is to sow clover or Winter vetch in August and plow it in the next Spring.

J. S. WOODWARD.

THE Department of Agriculture is making arrangements with European governments to secure monthly telegraphic reports of crop conditions. These statistics will make a valuable addition to the regular monthly bulletin issued by that Department.

SHROPSHIRE EWES ON A RAPE FIELD. Fig. 232.

SUMMER CARE OF SHEEP.

Successful Soiling on Oats and Peas.

Ideas concerning the Summer management of sheep are changing in a great many respects. That the sheep will do well as compared with other stock on closer picking is generally admitted. There is an old saying in describing a poor farm which ends "so poor that it won't grow white beans." After several years of experience and observation, I have come to the conclusion that it requires about as good soil to grow beans as any other crop. It is pretty nearly as true with the flock. The farmer can scrimp and starve his sheep if he wants to, and they'll respond to it with carcasses and products just as scrawny and starved as has been their attention. It is a rule that will hold through every State, and I believe in every clime, that the farmer with a choice paying flock treats them to the best his farm will grow. The best sheep farmers are growing a special crop for their sheep; and they are finding, too, that it pays. There is another very foolish idea that is happily fast passing away; that is, that the flock does not necessarily require water being supplied to them naturally or otherwise; that the flock can readily secure all the water they need from the moisture deposited on the grass at night. Possibly this might have been true to a limited extent with the old Merino fine-wool or grade back 30 years ago, but if it was true, times and conditions have changed wonderfully during the past few years, and especially since the modern mutton-wool sheep has become so popular. We have found that our heavy Shropshire ewes are just as anxious to get water during all seasons of the year as any other stock we have. We are certain that our sheep suffer nearly if not fully as much without water as any of our stock. Consequently, during all seasons, and especially during the hot weather, if there are no natural means of securing water, we see that they are supplied artificially.

Soiling for cattle is becoming more or less popular. With sheep many farmers, unless they have unlimited pasturage, sow a special crop. For this purpose there is nothing that compares with the rape plant. In this latitude the sheepman will rear the lambs on rape, and the ewes and lambs will summer on it, and in the Fall almost fatten on it; seemingly rape will do almost everything for the sheep but winter it. As a quick grower it is simply unsurpassed by anything. I have actually seen rape standing 18 measured inches six weeks from date of sowing. This is exceptional, but it shows what the rape can do. We sow more or less rape for sheep every year. Fig. 232 is a very good illustration of a few of our Shropshires feeding down a portion of a field of rape. It can be noted how closely the stems are trimmed, and how anxious the ewes and lambs are to get more. Rape should not be allowed to get too large before the sheep have access to it. I have noticed that the sheep will invariably take the younger and more tender plants in preference to the older and larger ones. The flock will take to the patches that are small and gradually work into the larger. At first the rape plant must be fed with some moderation or the effect will be the same as with clover. Rape may be made the main portion of the sheep pasture, but it is best to allow the flock to have access to other pasture on account of the extreme succulence of the rape.

We have been soiling a few sheep on fair pasture with sown oats and peas given once or twice a day this Summer. I am satisfied from results that sheep could be successfully soiled. We find that peas and oats are consumed almost greedily. There is only one trouble, and this is that on account of the extreme succulence green oats and peas are very loosening, and if fed too freely trouble will follow. We fed a little too liberally at first this season, and got some of the lambs to scouring rather badly; but from the fact that one yearling ram, which has been fed the mixture all the season, has had no trouble from excessive looseness, I conclude that with a little caution in the beginning one would have no trouble at all in feeding a mixed crop like this to sheep. Rape is apt to have the same effect until the flock has become used to it, then there is no difficulty. As is shown in Fig. 232, our ewes keep in good condition on good pasture without any grain whatever; but we do like to supply the lambs with about all they will consume. We find it quite necessary to push the young stock for about all they are worth, and find grain is a very great help. At present we are feeding a mixture of oats and cornmeal, two parts oats to one of corn. A mixture of bran we have also found to be excellent. The handiest and neatest way of graining lambs while yet running with the ewes is to provide a "creep" into which the lambs can go through a suitable opening, but yet too small for the ewes to pass through. Barring a flesh and bone-forming feed for the lambs, I have found no mutton breeds that required grain during the Summer months save possibly in suckling lambs, and few even then.

Shiawassee Co., Mich. C. P. REYNOLDS.

GRASS SEEDED WITHOUT GRAIN.

The "Clark" System of Grass Culture.

Here is a note from a new subscriber: "What do you mean by the 'Clark' system of seeding to grass? Who is 'Clark'? Where does he live? Does he know what he is talking about? What is his so-called 'system' as compared with the usual plan of sowing grass seed with small grain?"

For the past five years we have been writing about George M. Clark, of Higganum, Conn., and his field of grass. It seems necessary to tell the story anew each year. Instead of reprinting the old articles we try to get in the growth of the matter. It is quite evident that in a country as wide as America is any plan of farming must be modified and changed as it goes away from home.

But thousands of farmers raise good grass—why do you speak of "Clark's system"? Is he the inventor of it?

No, yet we do not know of anyone who has carried out his definite plan as carefully as he has.

Does he get more grass than anybody else?

So far as we have been informed he does.

What did he cut this year?

He had seven acres in grass and cut from them 79,490 pounds of well-dried hay. This is an average of 11,355 pounds per acre. Last year the crop on the same seven acres was 70,750 pounds.

Do you believe any such story?

Yes, I have been in this hayfield several times, and have reason to believe that each load of hay is accurately weighed as it comes from the field.

How many years had this grass been seeded?

Three and one-half acres were seeded last November. This year they averaged 10,118 pounds per acre. Another field of 1½ acre averaged 11,890 pounds, while another of seven-eighths of an acre 12 years old gave 12,210 pounds, and another of five-eighths of an acre gave 9,700 pounds, or at the rate of nearly eight tons per acre! There will also be another later crop.

What sort of grass was it?

Timothy and Red-top. Some of it contained a small amount of clover.

What is Mr. Clark's secret?

He has none. He simply knows what grass needs, and has been able to supply the needed conditions.

What are these conditions?

First, natural grass land, well drained, smooth, and with a perfect grade. Grass likes a stone two feet under ground, but not on the surface. There must be no dishes or knobs on the surface, which should be as level as the cement floor of a stable, so that it will gently drain water. Second, the upper four inches of the soil must be as fine as an ash heap that has not been packed by rain. The weeds and foul grass must be killed out. Third, there must be an abundance of soluble plant food. Mr. Clark uses chemical fertilizers, and says they are much better than manure. Fourth, Mr. Clark seeds his grass without any grain crop, and uses about twice as much seed as is usually sown.

That sounds easy—can anybody do it?

I have not been able to do it myself yet.

What caused your own failure?

My field was too rough. We did not get all the stones out, and the heavy floods of this wet season did too much washing. I think also that we did not use enough fertilizer.

Why do you advocate for others what you admit you have not done yourself?

I do not advocate anything beyond the careful preparation, heavy fertilizing and fair seeding. No man can expect to take rough land, full of stones and not well drained, scratch it over and say that he knows Clark's method is a failure. I advocate as close an imitation of Clark's plan of fitting the ground as a farmer can give. I know that many farmers with only one team and a dozen jobs pressing at one time cannot do it all. I am sure, however, that every extra working of the soil before seeding will pay.

How does Mr. Clark fit the soil? Tell the whole story.

It cannot all be told at once—being too long. I will describe the method next week. If you have a piece of clear land that you wish to seed down in this way begin at once to prepare it. Mr. Clark does not plow land, but uses various forms of the Cutaway harrow. Instead of turning the furrow over these tools lift and toss the soil, shaking it up to the sun and wind. The object is thoroughly to air the soil, and thus sweeten it and kill out all weeds and foul stuff. It must be said, however, that excellent work may be done with such a tool as the spring-tooth harrow. H. W. C.

PAN-AMERICAN.—In the Horticulture Building the cherry display is getting to be interesting. Idaho is receiving shipments of this fruit every few days, and Oregon has begun showing her immense cherries, for they are really so large that I have heard people ask if they were crab apples. The most conspicuous variety has been the Bing, which is black, but Napoleon, which is a sort of rosy red mixed with yellow, is more brilliant and attractive. Such cherries can scarcely be grown in any of the Eastern States. We have a promise from some of the New York growers that they will equal the western cherry exhibits, and we are waiting to see them do it. H. E. VAN DEMAN.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Budding Peach Trees.

J. C., Vineland, N. J.—I have bought a farm with about 10,000 peach seedlings on it. These were planted last Spring, and are now about three feet in height. When should they be budded? What does a professional generally charge for such work when the farmer furnishes all material?

ANS.—The peach seedlings mentioned should be budded about the middle of August or possibly a little sooner. If the service of a good budder is secured he should receive about $2.50 per day and board. It is hard stooping work, and requires much skill as well.

H. E. VAN DEMAN.

Tree Protectors; Stayman Apple.

W. W. W., Tyrone, Pa.—1. Would it be feasible in a young apple orchard to build a wire protection around each tree, and pasture with sheep? I could make it so that it would not hinder spraying, examining at the collar, or hoeing around each tree. When the trees should become large the wire would not be needed. 2. Is Stayman the best of the Winesap seedlings? Do you think it would be as profitable as York Imperial here? Would Sutton and Grimes keep here till April in a good fruit cellar if picked at the right time? Do you know of any market variety as good as, or better than any one of these four?

ANS.—1. Wire netting is sometimes used with good effect as a protection about apple trees where sheep or pigs are allowed to run in the orchard. It does not hurt them in any way, and it is only a matter of whether or not the cost of protection is greater than the benefit to the stock, that is, in case the trees would not do better under a state of tillage than used as pasture. 2. The Stayman apple seems to be the best of all the Winesap seedlings. I think it would be about as profitable as York Imperial in the region of Tyrone, Pa. I think it doubtful whether Sutton and Grimes would keep in that section until April in an ordinary fruit cellar, but they might do so. I think these four varieties just mentioned would be about the best that could be planted there for Winter use, either at home or for market.

H. E. V. D.

Questions About Apples.

J. T., Petersburg, Va.—I have a lot of land that is very light and sandy and is too thirsty for vegetables. I wish to set in late Winter apples. What kind would you advise setting? How far apart, and how prepare the soil? Is a water sprout as good to graft with as other parts of trees? Should trees be bought near location? Is the Le Conte pear the freest from blight that I can get? I have one planted on same soil as described, and it has made four feet of growth this year.

ANS.—In the vicinity of Petersburg, Va., I would advise the setting of such Winter apples as Winesap, Stayman, York Imperial, Ben Davis and Rome Beauty. These will all do well in that section. Apple trees should not be planted nearer than 30 feet in that soil and climate, and I think that 40 feet would be better, but in the latter case I would plant them 20 feet apart north and south, with the expectation of cutting out half the trees when they become large enough to crowd each other. The soil should be thoroughly plowed, just as if one were going to plant some farm crop, and where the rows are going to be I should make the dead furrows, plowing just as deep as possible in the bottom of each, and after the trees were planted I would use one horse to fill up these dead furrows with the plow, making at least two or three rounds. Water sprouts are not very good to use as scions, although I have grown a few scions for the purpose of testing the matter. The best scions are those which have large and well-developed buds, and that are one foot or more in length. It is always desirable to procure trees for planting as near home as possible if good ones are to be obtained, but if not, there is no good reason why they may not be transported some hundreds of miles and planted without any serious consequences. But, wherever a good nursery is at hand, I would advise going there with a wagon after the trees, or sending an order in writing to the nurseryman and have them shipped. The Le Conte pear is by no means free from blight. It was at one time thought to be so, but experience has proven this to be a great mistake. The Kieffer pear rarely has the blight, and is a much more profitable variety to grow.

H. E. V. D.

Pecans and Chestnuts in Ohio.

G. W. G., Columbus, O.—1. I noticed in THE R. N.-Y. that the pecan can be grafted on to the hickory, and wish to know whether the pecan will ripen in the northern part of Ohio. 2. Several years since, seeing some nice young chestnuts on my Athens County farm, I sent 1,000 to my Hardin County farm; many of them lived for a year, and all died within three years. The change from a carboniferous formation to the soils or clays of the limestone decomposition was too much for them. Will the Spanish, Italian or Japan chestnut thrive in the soils of the limestone formation, and mature in the central and northern part of Ohio?

ANS.—1. Some varieties of the pecan will ripen in the northern part of Ohio, but there are very few varieties that will do so. It is not at all likely that any great success will follow any experiment in this line, especially in grafting on the native hickories in the section mentioned. 2. In regard to growing chestnuts on limestone land, I would say that it rarely succeeds with either the native American species, or with those from Japan or Europe. There is something quite uncongenial in such soil to all of the chestnut family.

H. E. V. D.

Seedling Fruit Trees.

J. S. H., Worcester, Mass.—Is it really necessary that peach, plum and cherry stones should be planted in the Fall, that they may freeze in the Winter to make them grow? How many years from planting will it be before they bear? Will pear trees grow well if grafted on to apple, or can't it be done? The Sheldon is the variety referred to.

ANS.—It is a very common opinion that peach, plum and cherry seeds require freezing before they will sprout and grow, but this is a great mistake. It is, however, quite necessary that they should be kept moist, at least from Fall until Spring, and I like to keep them moist from the time they are gathered in the Fall until the next Spring. My plan has been to lay them on the ground spread out, not in a pile, lest they ferment and heat, and upon the approach of cold weather mark out rows and plant them where they are to grow in the nursery. When we think of the fact that peaches are grown in Florida and some other places where the ground rarely, if ever freezes, we can readily see that freezing is not an essential. Peach trees usually bear about the third year from seed, and plums and cherries two or three years later. The pear does not succeed well when grafted upon the apple, because the union is quite imperfect. Grafts will usually grow when properly set, but the wood of the one does not seem to be congenial with that of the other, and an ugly knot is usually formed, and before many years' bearing the graft will be blown off by the wind.

H. E. V. D.

Dodder on Raspberry Plants.

F. H. F., Andover, Mass.—I send a parasite which attacks and runs on my raspberries. It troubled me to some extent last year, and has just broken out again. I suppose the remedy is destruction of both parasite and host.

ANS.—The parasite attached to the raspberry stalk proved to be the plant known as dodder. This plant originally starts into growth from the ground, but as it runs up and finds some other plant to which it can attach itself, it then gets its sustenance from the other plant, and its ground roots usually die. The dodder then reaches out from plant to plant and attaches itself to the plants, living upon them. If the infested raspberry stalks can be isolated from the remainder of the patch not yet infested by a few feet of open space, so that the dodder cannot reach across, it will soon run itself out. I know of no method of killing the dodder already attached to the plant without injuring the plant, unless the parasite can be pulled off from the plants.

M. V. SLINGERLAND.

Killing the Cucumber Bug.

J. S. B., Syosset, N. Y.—I have a field of pickles which I spray regularly, but that does not seem to check a small striped bug, called here June bug. I have thought of using whale-oil soap on them but do not know how. What should I use and how, in order to exterminate this little pest?

ANS.—The small striped bug is the well-known striped Cucumber beetle, which this year is proving a very destructive pest, not only in its adult or beetle form, but its grubs are also doing much damage by boring into the stems of the same plants. The latest recommendation for fighting the pest is to plant some early squash along one side of the field before the melons or cucumbers are planted. The beetles will take the squash vines in preference to the others, and then by keeping the melons or cucumber vines well sprayed with Bordeaux Mixture and applying Paris-green to the squash plants one can keep the beetles off the cucumber vines. Some report good results by using liberal quantities of tobacco dust on the infested plants, while others claim to drive away the beetles by the use of air-slaked lime in which a little turpentine or kerosene has been mixed. Of course, early in the season one can cover the plants with frames having a cloth top and then keep out the beetles until the plants begin to run. It is also well to put in a liberal amount of seed, so that there will be plants enough for the bugs and to give a good setting of vines. The large beetle sent with the striped beetles is the only kind of "lady bug" which is not beneficial. Instead of feeding upon plant-lice and other small insects as do the rest of its family, it feeds upon plants and sometimes does considerable damage. It is called the Boreal lady bug (Epilachna borealis). It succumbs to the same treatment as the striped beetle.

M. V. SLINGERLAND.

The Use of Lime.

D. O. S., Myerstown, W. Va.—In liming would you recommend a large quantity of lime to acre, or not so much and oftener, applied on land that is worked down? Can lime and fertilizers be mixed together and sown with wheat? If so, how much to the acre?

ANS.—Most farmers that we have talked with prefer to use lime every four or five years—20 to 25 bushels per acre. As a rule, they put the lime on the wheat and grass. This practice conforms to the advice of the scientific men. The best plan seems to be to broadcast the lime after plowing and harrow it well into the ground. We would not mix the lime with the fertilizer. Grain fertilizers usually contain dissolved phosphate rock or other soluble phosphoric acid. The lime will cause this to revert and thus become less available as plant food.

Winter Oats in the North.

F. E. G., Tyngsboro, Mass.—Are Winter oats adapted to this climate, and where can the seed be purchased?

ANS.—No, the Winter oats cannot be recommended for grain north of Philadelphia. They make a heavy growth in the Fall, thus providing good pasture, but with us they die out in March. They make a good cover crop for Fall and Winter, as they die out before time for plowing.

Blood Clots in Eggs.

A. L. D., Southampton, L. I.—We occasionally find the yolk of a fresh-laid egg bloodshot. Can THE R. N.-Y. tell me the cause and a remedy?

ANS.—The blood clots in the egg are usually the result of ruptured blood vessels in or near the oviduct of the hen. The trouble is worst in fat and lazy hens. The best remedies are change of feed, less food or exercise. Anything that will make the hen work off her fat or put her in better condition will help.

TO obtain satisfactory results in painting, we recommend that you use Pure White Lead and Pure Linseed Oil, and employ a practical painter.

If the services of a competent painter cannot be obtained, you can get satisfactory results by using any of the brands of *Pure "old Dutch process" White Lead* named in the margin and the National Lead Company's Pure White Lead Tinting Colors, by which any shade desired can be made, the greatest economy and the most permanent satisfaction secured.

For any color or shade required, use NATIONAL LEAD COMPANY'S Pure White Lead Tinting Colors. Pamphlet sent free upon application.

National Lead Co., 100 William Street, New York.

The New Horticulture

BY H. M. STRINGFELLOW.

We do not hesitate to say that this is one of the most interesting books on horticulture that ever was printed. Most reading farmers have heard of the now famous "Stringfellow Method" of planting trees, but few understand clearly what it is. This book tells the whole story in clear-cut, forcible style, which all can understand. Not only is the theory of close root-pruning carefully explained, but the general principles of gardening and fruit-growing are discussed. Mr. Stringfellow is a practical gardener, and he gives his own experience. We commend the book to all without reserve. New Edition, paper covers, 50 cents.

THE RURAL NEW-YORKER, New York.

Rye and Clover for Green Manure.

W. L. M., Searsburg, N. Y.—I have a seven-acre field that is badly covered with Canada thistles. How shall I treat it to eradicate the thistles and at the same time add humus, and if possible realize something of a crop next year? I think of plowing now and sowing soon to rye. Can I sow Crimson clover in rye and plow all under next May or early June, and plant to potatoes? There is a heavy growth of thistles to turn under. Soil, clay loam. Would it be best to plow early next Spring, turning under wheat, rye and clover, sow peas, and treat as described by K. S. Wing?

ANS.—If we had that field in our own farm in New Jersey we would plow it as soon as possible and try to work it over at least twice with a Cutaway or spring-tooth harrow. During the first week in August we would sow one bushel of rye and a peck of Crimson clover per acre. This would make a good growth. In September, if the field were well fenced, we would turn in pigs and let them eat down the crop—taking them out early enough to give a fair growth before the ground freezes. In the Spring we would plow the rye and clover under when the rye is a little over knee high, if it were possible to do so. When rye gets much larger than this we find that it decays slowly, and does not add much fertility to the crop that follows it. The plan of sowing peas to grow between rye and potatoes seems reasonable, but we have never tried it.

When Grain Heats in the Bin.

C. N. R., Canton, Pa.—On page 504 of THE R. N.-Y. I notice advice in speaking of thrashing wheat, to store in tight bins, and if it heats to use bisulphide of carbon at once. I cannot understand how this would save wheat from heating. I once lost a lot of wheat and rye from early thrashing because of heating. I now have about 300 bushels of rye in shock, which I would like to thrash early but am afraid to because of heating. I had thought of handling from bin after three or four days of storing. Can you make me any suggestions?

ANS.—We referred to the heating caused by the Angoumois moth or the grain weevil. One indication of the presence of these insects is the heating of the grain. When the hand thrust down into the grain feels hot, or quite warm, it is a good indication that the insects are at work. Then the bisulphide of carbon should be put on top of the grain. Pour it into a deep dish and cover the top of the bin. If the grain is not dry enough when thrashed it may be stored in bags. This is done in New Jersey, where the Angoumois moth is found. The bags should be well filled and tied up tight, so that when the moths emerge from the grain they cannot get out, and die before starting another brood. The bagged grain can be put in a dry airy place, so that it will not heat.

HOW MUCH FOR THE MANAGER?

Two men in West Virginia intend to set 50 acres in apples and peaches. One man wants the other to take entire charge of the planting, cultivating, pruning, etc. What would be a fair money allowance for the man who does this work for say five years, while the trees are coming into bearing?

I think a fair remuneration $600 per year for the first five years, with one-half of the net profits. After the third year, if well cared for, the peaches should yield quite a handsome income.

Owensboro, Ky. J. H. H.

From a New England Standpoint.

Conditions in Virginia and New England are so much different that estimating the value of such services in one place would be very much out of place in the other. I have a letter from a large fruit grower in North Carolina stating that he can hire the *best* of help for 80 cents per day. That class of help in this part of New England would cost $1.75 per day of 10 hours. If conditions are the same in Virginia, it would readily be seen that to supervise an orchard of 50 acres would cost only about one-half what it would cost in New England. A person of sufficient qualifications properly to oversee an orchard of 50 acres for the first five years after setting, could command a salary of from $700 to $900 per year in New England. Fruit growers everywhere, I think, will agree that the first five years of an orchard's life are the most critical in its history. To prepare land, fertilize, set trees, cultivate, prune, spray and leave the orchard in what a thorough orchardist would call first-class condition at the end of five years, requires a man of far more than ordinary ability. As it would take only three months per year of the overseer's time for the first three years, I should estimate $175 per year for the first three years a fair compensation. As the peach trees would come into bearing, the fourth and fifth year would require more time, and as good judgment as would the growing of the trees. I think that $350 per year for the last two years would be a fair compensation, the company to pay traveling and incidental expenses. If an equal owner in the company should assume these duties he would receive only one-half of this amount, as the other one-half would be his own. S. R. WALKER.

Massachusetts.

What a Virginian Says.

I will make a few suggestions to those contemplating planting orchards. Consider suitability of soil and adaptability of variety planted. In this there have been many failures. Observe care in preparation of the land, which should be plowed very deep, when the land is soft if possible (not wet); say in November and December. The Winter frost will almost prepare it for the Spring planting. As soon as the Spring opens put the land in thorough order, and if the variety is of large growth plant 40 feet apart; no variety closer than 32 feet apart. Peach trees can be alternated one way between the apple trees, and they will not materially affect the apples before they will die out. To do this the land should be good; otherwise it would affect the growth of the apple trees.

Now if the manager or overseer named will take hold of the work and apply himself closely and labor as well as direct the work, the time needed for the first three years (until the peach crop comes in) will be comparatively little, beginning March 1 and closing by August 1. After that time there should be very little to do in the way of cultivation, say five months, and here with us I would have no difficulty in getting an experienced man at $1.25 to $1.50 per day, without board, or in other words say $40 per month. As this is to be a partnership matter of course the manager or overseer, who is a partner, should be paid by his partner $20 per month for his services. A. WAYLAND.

Virginia.

EVERYBODY'S GARDEN.

THE BLACK SQUASH BUG.—The ravages of this pest are so widespread that various remedies gathered from widely different sources may not be amiss, as if one preventive is not at hand, another may be, or be easily accessible. In general, the best preventive is thorough culture and high fertilizing, in order if possible to make the growth of vines so rapid and vigorous that the bugs will be practically harmless. Spraying with any of the insecticides will be of no avail, as these bugs are not leaf-eaters, but sap-suckers. However, gas tar, about five gallons to the barrel of water, sprinkled or sprayed on, is a remedy long in use and said to be effective. Hunting out and destroying is a sure way, but somewhat tedious in large areas. If this plan is followed, the better way is to place shingles or boards near the hills late in the afternoon. The bugs will gather under these at night and may be easily gathered and destroyed in the early morning while they are yet sluggish. They are sly workers, and nearly always work on the under side of the vine near the main stem, so that often much damage is done before their presence is discovered. Kerosene oil and wood ashes, a tablespoonful of the former to two quarts of the latter, sprinkled around the hills, will generally keep them off, and sprinkled over the vines when damp is also a good remedy for the striped beetle.

SQUASH VINE BORER.—This is a very troublesome pest in many localities, but usually comes later than the black bug. The fly usually comes late in July, and the borer begins its work early in August. Sometimes they appear earlier, but early or late, as soon as they are discovered even in a single vine, it is high time to apply the remedies. Tobacco dust liberally applied around the hill is a remedy against the borer, and a good fertilizer as well. On vines where they have already started their work, two or three leaf joints of each vine should be covered with moist earth. If well done the vines will take new roots at the covered joints, and the plants may be saved even if the main root dies. Doubtless the most effective remedy is bisulphide of carbon. Make a hole an inch deep in the soil of the hill, and about three inches from the main stem, drop a few drops of the liquid in the hole and cover it immediately. The fumes will work upward through the vines, and not only destroy the moth and eggs, but the odors will effectually keep the fly away. Great care must be taken in handling it or carrying it not to inhale the fumes, as it is very poisonous, and it must by no means ever be brought in contact with fire, as it is highly explosive.

CELERY RUST.—Extended experiments at some of the experiment stations have demonstrated that thoroughly spraying with the Bordeaux Mixture at intervals of say, two weeks, during the season, will effectually prevent the rust. When there is danger of the trouble, it should certainly be thoroughly tried, for the rust is a troublesome factor in successful celery growing.

THE ASPARAGUS BED.—The bed should receive extra care from now on, and all seed stalks should be cut out. The ripening of the seed severely taxes the vitality of the roots, which is entirely needless. The plants growing up from the scattered seed become a nuisance; fully as much so as weeds, and the less seed ripening that is allowed the better. An application of salt will be beneficial, and while a difference of opinion exists regarding its usefulness, there is no doubt but that it will retard the weed growth, which of itself is an object.

Michigan. J. E. MORSE.

ENGLAND is having the most severe drought that has been known in 11 years. The water supply of Manchester is becoming so scanty that it is shut off from eight at night to five in the morning, and street sprinkling has been given up.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

PERENNIAL FLOWERING PEAS.—One does not often see perennial or "everlasting" peas about country homes, though there are few reliably hardy plants better deserving general culture. It takes a year or two to grow blooming plants, but once established they gain in vigor and beauty for an indefinite period. Their long tough roots resemble thongs of buckskin more than most plant roots, and greatly resent removal, though seedlings may be easily transplanted when they have made their first six inches of growth. The seeds are hard, and germinate very slowly unless well soaked before planting. It is best to put the seeds in water in a warm place, and examine them two or three times a week, picking out and planting all seeds as they swell up. As it may take a month to soften all the seeds it is scarcely necessary to say that the water should be frequently changed. The seeds of many leguminous plants have this peculiarity of resisting the absorption of moisture for a considerable time. If a number of seeds of any of the common clovers are soaked in water it will be noticed that some will swell in a few hours, while others of the same lot will require as many days before a change is noticed. The softened pea seeds may be planted in a box or pot for future transplanting, or at once where they are to bloom, but in the latter case they require careful weeding and cultivation, as the young plants are very weak and slender for a considerable time. They make splendid trellis plants, and are very useful for covering rough places, scrambling over bushes and rocks in strong competition with native growths. They are too rampant for planting in the border, and should be confined to situations in the background, where they will reward the planter year after year with their fresh and pretty flowers, as useful for cutting as decorative on the plant. We have been thus particular to note the difficulties of germinating the seeds, as ordinary planting of the hard seeds in the manner of the sweet-scented or annual flowering peas is usually attended with failure and disappointment. It takes them so long to come up that they are forgotten, and the tender seedlings are overgrown and perish from drought or neglect.

The best varieties come from the species Lathyrus latifolius, a native of the forests of Europe. The common type produces large rose-colored flowers in clusters of four to seven. The variety L. latifolius albus is similar, but milk white in color. An improved form, L. latifolius splendens, is sometimes planted, but does not come very true from seeds. The colors are dark purple and bright rose red. Fig. 233 shows the rose and white blooms in natural size. Besides L. latifolius there is L. grandiflorus from southern Europe, which makes a thicker but less rugged vine, and produces large purple blooms in clusters of two or three, and L. rotundifolius from Russia and the Orient, with rose-colored flowers in larger clusters. It prefers a rather cool and shady place, and is likely to die out in three or four years. L. splendens, the "Pride of California," is claimed to be the best of all. It is found on the dry hills of the coast mountain ranges of California. Although often advertised by seedsmen the seeds of the Splendens variety of L. latifolius are generally sent out instead. The true Splendens is rather shrubby, and bears large clusters or peduncles of bloom, often containing as many as 12 large rose or violet flowers. It is not hardy in the greater portion of the eastern United States, but can be grown under glass, where it remains very dwarf, seldom getting more than a foot or two high. We have also grown L. Magellanicus, sometimes known as Lord Anson's Blue pea. It flowered sparingly the first season, and perished during the Winter. The flowers were small and clear, dark blue. There is also a white variety. The foliage was retained until a hard freeze killed the plants. We would like to see a more extended use of the best perennial peas, as they will repay through a long series of years the slight difficulties attending their early development.

THE RUBY QUEEN ABROAD.—A correspondent in The Garden, the foremost British horticultural journal, says of our Ruby Queen rose: "The delightful blending of color is so pretty, the ruby-red predominating over the white eye and the edges of petals, and the contrast reminds one much of the Zonale Pelargonium, Mme. Jules Chretien. It is a distinct and charming hybrid of Rosa Wichuraiana."

BLACK SOLUBLE INSECTICIDE SOAP.—This promising new insecticide is first offered this season by V. Casazza & Bro., 190 Prince Street, New York. We have made several trials of it on aphids and other soft-bodied insects, and find it very effective. It quickly rids the plants, and adheres well, leaving a white deposit on the foliage, which persists after heavy rains. We are not informed as to its ingredients, but infer that it is not poisonous to higher animals in the quantities used. In the solution recommended, one part of soap to 20 of water, it injures tender vegetation to some extent, but in a strength of one to 30 it seems harmless, and is equally effectual against the insect pests. The soap solution is easy to prepare, and develops no unpleasant odor, which is more than can be said of some horticultural soaps.

W. V. F.

ASPARAGUS BUGS AND POTATO BUGS

ASPARAGUS.—For years we have had an asparagus bed in the house garden. that has been annually cut until our first peas were grown, and very little rust ever appeared on it. Last year there were many weeds in the bed, and, as I had set out a new and larger bed three years ago in our farm garden, I risked cutting the bed clean with a scythe the last of July, and digging it over thoroughly. The asparagus came up fresh and nice, and, until the frost killed it, was green and healthy. The farm garden patch was quite different. Bugs came on it in June, and long before frost it was brown and apparently dead. In fact, some plants did die, as I found this Spring. This season we cut the farm garden patch for the first time, leaving the weaker stalks to grow. The latter part of June I found the stalks left with bugs on and apparently rusting. In doubt as to whether I had bought the rust with the plants, as I had never seen it in the house garden, I mowed it over, burned the tops, and ran a cultivator over the ground. The bug and rust season seems to have passed on, and there is a splendid growth of healthy looking plants. It may be a little late now, but, if I had a patch of rusty asparagus, I should cut it clean, burn the tops, and cultivate now, as it seems to be a dead sure thing if the rusty tops are left on the roots.

PARIS-GREEN AND WATER.—I see that the Hope Farm man has a formula for sprinkling potato vines. One of my neighbors has a $10 outfit for sprinkling, and he read in a Government report that 5 1-3 ounces of Paris-green was the correct amount for a certain number of gallons of water. He measured the water, and weighed the Paris-green down to the third of an ounce. He has kept his potatoes and the bugs sprinkled up to date, and, like the Hope Farm man, he has the stalks left—the bugs have stripped the leaves. It is a rare occasion when I have a chance to brag, but I am credited with having the best looking two acres of potatoes in this section. We planted Maine-grown seed early, using $25 worth of commercial fertilizer on the hills after planting. They grew so fast that we only got a chance to cultivate and hoe twice, and they have been dusted with Paris-green once. My son and I did that ourselves using what, as it has no special name, I call a fanning mill. I bought 10 pounds of "farmer's" Paris-green in boxes for the two acres, but we have half a pound left. My neighbors felt sure that we had killed everything in the lot, but all we miss is the bugs. The weather was hot and dry for a week after we applied the poison, and, at the end of that time, I failed to find a single old shell-back, and only an occasional slug. I assume that the stuff I bought was nine-tenths some harmless mixture, but it was the same that my neighbor weighed so carefully and put into his watering cart; and I assume that, instead of 5 1-3 ounces, he actually got less than a third of an ounce of poison to his barrel of water, and consequently might as well have squirted it in front of his house to keep down the dust.

Stevenson, Conn. R. S. H.

R. N.-Y.—The Hope Farm man killed the bugs. Some of the vines were badly eaten before he could get at them.

Experience with Strawberries.

In the Fall of 1899 I planted about 1,500 feet of land to strawberries. Wishing to find the best berry for my environment, I planted Gandy, Wm. Belt, Glen Mary, Marshall, Henry (sic), Chas. Downing, Carrie, Star, Nic Ohmer, Parker Earle Jr., Margaret, Mary, Tennessee Prolific, Michigan and Ridgeway. Last year, in single plants, Wm. Belt, Glen Mary, Ridgeway and Gandy all did well. This year, in matted rows, there was only one berry—Gandy—the others were nowhere. I don't think a plot of 30x6 feet of Nic Ohmer produced two boxes of large fruit. Parker Earle Jr. was a small imperfect Wm. Belt. Ridgeway last year was fine, but this year no good. If I did not have a plant trade I should grow nothing but Gandy, but, unfortunately, the Gandy does not thrive in light soil. My land is heavy reclaimed swamp. Gandy grows not only large and handsome, but the most prolific of any plant I have tried. Carrie is so small and sour that I wonder at the good word it gets now and then from THE R. N.-Y. Star seems to be a very poor Sharpless. Margaret is a poor grower and shy yielder of indifferent fruit. It is fair to say that all these plants were grown in land (new) that never had any manure, and no fertilizer except 100 pounds nitrate of soda last year. I harvested 400 boxes good fruit, but I got most from Gandy per plant. Wm. Belt last year produced some immense berries, but in matted row they were almost too small and poor to pick. I believe this experimenting with many varieties is the only way to find out what fruit is best adapted to a person's land.

Massachusetts. G. L. C.

KILLING CHINCH BUGS.—Prof. J. M. Stedman, of the Mo. Exp. Station, says in a recent bulletin:

By plowing for a space of 10 feet around the cornfield, harrowing and dragging brush after the harrow, so as to make as much dust as possible, it will be found that when the young bugs begin to migrate from the wheat to the corn, they will not, as a rule, be able to cross this 10 feet of dust. When the insects develop wings, they may fly over the plowed space (this will happen about once in 10 times) and, if they alight upon the first few rows of corn, the second method may be used for destroying them. When the insects collect, as they frequently do, upon the first few rows of corn, the best way to kill them and prevent their spreading through the field is to spray immediately with kerosene emulsion. This will not injure the corn, and will kill the bugs readily. Kerosene emulsion is made as follows: Dissolve one-half pound of hard soap in one gallon of soft boiling water; add two gallons of kerosene or coal oil, and then by means of the force pump with the spray nozzle removed, churn this mixture for 10 minutes by pumping it back into itself. Then add to this emulsion 19 gallons of water, stir thoroughly, and use as a spray. This spray kills only by contact, and hence one must actually touch the bugs with the spray in order to kill them.

Hope Farm Notes

PIGS AND POULTRY.—I have told how we arrange our garden. Last Winter and until the middle of April the hens ran in a large enclosure back of the barn. They were fed in different parts of this large yard, so as to scatter them about. When time for plowing came we put a netted wire fence around a large adjoining space. This included part of a rye field. The houses are built on the dividing line of these two large yards. We closed the doors leading into the first place and plowed it for a garden. The hens made it strong and fertile. The hens and large chickens are now running in the other place. The rye grew into grain, and as all Jerseymen know, with the first of July comes a great crop of ragweed, plantain, chickweed and others too numerous to mention and too few to kill each other off. We were a little crowded in the pighouse and so we turned five little shotes in with the hens.

EARNING THEIR LIVING.—These little children of ham are having a great time. They eat the apples that fall from the overhanging trees, "hog down" the rye—grain and stalk—clean out the chicken trough before it can sour, eat chickweed and grass until their stomachs ache and then they cure it by stuffing on ragweed.

Don't they kill the chickens?

No, they are not large enough yet. They seem to be on good terms with the poultry. I thought they would chase the old hens and hurry up their moulting a little. I rather think such exercise ought to start a hen's feathers. This scheme is working so well that we hope to make at once a number of portable pens that can be easily moved about. With a pair of little pigs in each we can thoroughly pig all land that cannot be plowed. My friend the pig doesn't want to be a loafer. He will work for his living if you will only let him. That's more than you can say of some humans who deride the pig.

THE CORN CROP.—For nearly three weeks we were unable to get into the corn properly. There was more or less rain every day, and every energy was needed to try to save the hay. At last there came a hot windy day—actually without a drop of rain. Then the horses began their march up and down the corn rows, with the heavy blade at the back of the cultivator and the side shovels on, so as to throw some soil up to the hill. Some of our farmers took plows during the wet season and threw double furrows up to the rows. I don't believe in that, but in a wet season like the present I am quite sure that it pays to hill up a little. The side wings on the cultivator do this about right. Since we are putting on fertilizer late I think this slight hilling is more necessary, for I want that fertilizer well covered with soil. Some of our corn was so badly in need of tillage that it was turning yellow. Some of the hills on our richest ground were as pale as straw, yet within 48 hours after a deep cultivation they turned green again. I have had people tell me that this shows that the cultivator brings fertility to the soil. I feel sure that tillage does make the soil more productive, but in the case of my corn the trouble was that the wet soil had packed so close around the roots that no air could get to them. Air is necessary to the roots of plants. When we ripped up that hard soil with the cultivators we let the air in. In New York last week a man was locked into a big safe by mistake. They remembered and opened the door just in time to save him. The cultivation of that packed soil meant, to my corn, about what the open safe door meant to that man.

STRAWBERRIES.—This fruit is picked in June, but it is saved in July and August. I have a fine plot of Gibson and Marshall, as well as other newer varieties. What a job it is to keep this fruit as clean as it should be. It is horse and cultivator, hoe and fingers again and again through these hot, boiling days. The beds must be kept clean now, or the grass and weeds will surely take possession. On our soil we can get the weeds all out and do a little honest bragging about it. In four days you take some friend out to show him how it ought to be done, and you find half your weeds come to life, and new ones starting everywhere. Our weeds are such hogs that we have to bring true hogs in as a therapeutic agent. It is said that in nature every living thing generates its own poison. When a weed becomes a hog the hog cure is the only thing for it. Pull it up, put it in basket or wagon and carry it to the hoghouse. As it turns into pork its evil days are numbered. It is a puttering job to try to putty up the escape holes of a weed in this way, but I shall keep at it. The Marshalls are immense. If each plant sets two good runners I shall be well satisfied. The other runners will do to transplant.

FARM NOTES.—We drilled in yellow turnips on July 20. They followed rye, which was cut a week before. The ground was plowed as soon as the rye could be taken off, and well harrowed down. We put the seed in with a hand drill. I have never obtained good results from broadcasting yellow turnips. It is quite late for sowing this crop—but everything is late this year. . . . I have bought some seed of Cowhorn turnips and shall sow them in the corn—mixed with Crimson clover. I think this is a fair experiment to make, though no one should expect extravagant results from turnips. . . . The "Clark" grass has finally been cut, and we were all surprised at the outcome. We have no platform scales, so I cannot give the exact yield, but it was the heaviest grass we have yet cut on the field. One strip of nearly half an acre cut, I am sure, nearly 1½ ton. The whole field was a great surprise. The grass was so short that it did not seem possible to get the weight. It was so thick, though, that the bulk and weight appeared. After Charlie cut it the field lay so thick with grass that he went right out and borrowed a tedder. No one could cure such grass as that without a big shaking up. That experience gave us an idea of the value of a tedder that we never had before. . . . It was a shame to see that beautiful grass lying knee deep on the field and a black cloud mustering its army in the northwest. We were three days getting that hay under cover. The morning would dawn clear with good sun. All hands would shake the hay out and watch it like hawks. Three times the wagon got to the field, to be driven back to the barn by a furious and sudden burst of rain and hail, which soaked the hay, flattened the corn and knocked the precious apples from the trees. Then the sun would dart out again and the hay would stew away through the afternoon and night. The boys stayed by it as best they could and finally got it to the barn. The color has been bleached out of it, but the stock will eat it. The oat hay was so badly stewed that we will feed it out at once. I usually keep it for March feeding. . . . The sowed corn has come up well. In 14 days after sowing the first lot the plants were five inches high. Under ordinary circumstances I call it bad farming to sow corn broadcast. It should be drilled and cultivated by rights. This is not an ordinary season by any means, and we are forced to resort to makeshifts. As it looks now I think that sowed corn will give us as much and as good fodder as millet, sorghum or drilled corn.

HAVE A CIGAR?—The Hope Farm man has spent some time of late pondering over what may seem to many a strange problem. A man who is hard of hearing has usually a soft job at finding themes for reflection! Strange things sometimes creep into the mind of a deaf man, and the discussion is narrowed down to the personal point of view. I have been, for some time past, turning this question over in mind:

"Shall I begin to smoke tobacco?"

Some of my good friends will start up in great indignation and say there isn't any possible chance for a debate on such a question. I have seen so many sides of human life, and so many unfortunate results of a refusal to reason out the truth of such matters, that I believe in giving all sides a hearing. But what can be said in favor of the filthy habit of smoking? It does not seem to be regarded as filthy by those who practice it. Why, some men are even led to *chew* tobacco without understanding how perfectly disgusting that is to others!

A skilled doctor goes so far as to tell me that the use of tobacco would help my nose, throat and ears. He gives what seem to me sound reasons for this, and points out a minister of the Gospel who was helped in this way by moderate smoking. I know, however, that anything like excessive use of tobacco interferes with the action of the heart, and thus stimulates a craving for liquor. There can be no doubt that the cigar or pipe is a good social friend. Sometimes as I sit alone, after a long days' work, busy with problems that will not go to sleep with the sun, I must confess that I envy the man with the cigar, for his care seems to puff away with the tobacco smoke. It seems as though tobacco in moderate quantities is the special friend of the deaf man. Yet, here I have, all my life, protested against its use. I have seen its ill effects. I know that its tendency is to make a man selfish, lazy and slow. I would not have my children touch it The breath and the clothes of the tobacco man are offensive—there can be no getting around these things. I know them well. Would it not be a clear case of moral backdown if now, at middle age, I turn tail and use the stuff which I have always denounced, and with sound arguments? As an end to my mental debate there usually arises before my mind a picture of the Madame as I first saw her—a girl of 19 years! I made a promise concerning tobacco then that has not yet been broken. Gray hairs and wrinkles have accumulated since then, and so has her objection to tobacco.

Will I have a cigar?

No, thank you, gentlemen—your tobacco is good to spray on trees or to put in a hen's nest, and you may think you get some comfort out of it—but I don't care for any! H. W. C.

DELAWARE NOTES.—The Crimson clover thrashing is about over; the hot dry weather has been splendid for bright, clean seed. Crop not much above average, as many farmers now seed it with wheat in September and cut both for hay. The former practice was to seed it with rye, but the rye matured too early for the clover, while wheat is just right. The talk of the hay bailing in horses is all bosh, as far as my experience goes; and I have fed good horses on it once and twice a day for months. It should not be used exclusively. One or two feeds a day should be something different. Wheat is a good crop, and roller-process mills are multiplying. Spring oats are injured by the drought; so are potatoes. Corn is clean and in good shape for growing, now that the rains have come. We are having our first rain for three weeks—gardens and truck patches looked pitiful after the extremely hot weather of last week. Cow peas just up on sandy land were killed by the heat. One farmer will lose 18 bushels of sowing. J. C. E.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER.

A National Weekly Journal for Country and Suburban Homes.

Established 1850.

HERBERT W. COLLINGWOOD, Editor.
DR. WALTER VAN FLEET, H. E. VAN DEMAN, MRS. E. T. ROYLE, } Associates.
JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, AUGUST 3, 1901.

EVERY day of the hot, dry weather lessens the chances for the corn and the apple crops. Winter fruit will undoubtedly be short. If there are any localities where, for some local reasons, apples are in sight, growers will do well to let the fact be known, for there will be a rush of buyers and sharp competition for the fruit.

*

IN Mexico, corn forms a large part of the food of the people. Speculators have got hold of the supply, and are forcing the price up to such an extent that it is said that the government may take off the import duty on corn from the United States. This would upset the calculations of the speculators in short order, and in our opinion, is one good way to treat all those who attempt to monopolize the production or sale of necessities.

*

SOME of the most valuable space in the agricultural exhibits at the Pan-American Exposition is occupied by displays of whisky, rum and other alcoholic products made from cereals. Why should such exhibits be put in the Agriculture Building? The present abuse of intoxicating liquors has done more than any other one thing to injure the farmer, by displacing legitimate farm products. It would be about as consistent to exhibit a mad dog in the live stock show because the dog is a product of meat! We believe this is the first time such a disgraceful classification was ever made!

*

THE artist who drew the picture printed on page 530 probably never saw a cow in his life. It was perhaps his misfortune to be born and raised in a town. That is about the worst start in life that an American citizen can have. He was "off" as regards the shape of the cow, but he sized up her feelings properly. The cow and her milker off in the country are the best friends of the city baby. The milk as it leaves the farm is pure and sweet—life-giving and nourishing. Some of it is fit to serve as an embalming fluid before it reaches the baby's bottle. It is drugged and poisoned by the dealer, and not by the farmer.

*

THE famous Prof. Koch, of Berlin, the discoverer of the bacillus or germ of tuberculosis, announced last week at the London Tuberculosis Congress, that, in his opinion, based on long-continued and indisputable experiments, bovine tuberculosis or cow consumption is not transmissible to human beings, and the dreaded human ailment also is harmless to animals. Prof. Koch, in view of his great attainments and exhaustive studies of all aspects of consumption, may be considered a supreme authority, yet his conclusions will doubtless be attacked by many of less experience. There is no denying that the evidence of the transmissibility of bovine tuberculosis to humans is of the most flimsy character, and has never warranted the extremely harsh measures of inspection and destruction of valuable animals advocated by some medical authorities, and it is probable that sufficient reaction has now set in to call a halt in the matter. We want all reasonable precautions to keep our dairy and beef animals free from disease, but we should be sure we are on the right track before going ahead at such destructive speed. Prof. Koch claims that human tuberculosis is disseminated almost wholly by the sputum and excretions of consumptives, and that the dread disease is practically curable in its earlier stages. The early recognition of the affection and the isolation of tuberculous persons in sanatoriums equipped by public and private means is the most promising method to reduce and finally stamp out the disease. Something of the same character must be done with tuberculous cattle where the value is great enough.

*

Now is the time for the careful farmer to estimate his Winter's supply of fodder. There will be many hungry mouths at the barn next Winter, and there are many long days before next April. The hay crop has not been exceptionally large in spite of the wet season. In many sections the corn is backward, and in many more the feeding value of the cornstalk is largely thrown away. It is not yet too late to sow fodder corn or to plant sweet corn for fodder. We shall continue to plant corn up to the middle of August on the higher points of the farm. The use of the shredder and other machines for tearing and crushing the dry stalk has changed the whole plan of horse feeding on many farms. Shredded dry fodder is quite equal to hay as Winter feed for horses. With a fair-sized field of Alfalfa a farmer can feed his stalks, sell his hay, or cut down his acreage in meadows.

*

Now and then we receive a statement like the following:

> I followed the advice given in your paper some time ago, how to prevent stinkbugs from eating squash hills. I lost 350 hills of squash by trying it. The advice I refer to was to put radish seed in each hill. The three rows were teetotally destroyed by striped and black stinkbugs. The nine rows that had no radish seed had no stinkbugs and very few striped bugs, and I managed to save them all. I have been a market gardener for 20 years, and I think I have had experience enough to take nobody's advice hereafter. A. M. J.
> Akron, O.

On page 387 a correspondent said he tried this plan in a small way, and asked for reports from others. He did not urge anyone to try it, neither did he claim that the radish drove the bugs away. He just wanted to know about it, and was very careful to make this point clear. We are surprised that any man with 20 years' experience in gardening, should change a mild suggestion into positive advice. If 50 men had each tried seven hills of squashes with radish seed in them, and reported results, it would have made a good experiment. We should all have learned something from it. For one man to try 350 hills was too much of a risk. Is he justified in blaming anyone for the loss of the squashes? Do any of us fully realize the responsibility we assume when we make statements in print about new or untried things?

*

THE corned-beef-and-cabbage and houses-and-lands views of life will, if allowed to have their own way, crowd out the finer elements of one's nature. It is possible for a man to be so intensely practical as to become dead to the poetry, beauty and music all about him in nature. All that he sees in a field of wheat are the grain and straw, the hard work needed to handle them, and the money they will bring. In the great oak standing alone on the hill, he sees only shade for the cattle, and a sawlog and lot of fuel when it is finally cut down. The brook rippling over the stones is only a place to drink. In the grass-covered fields he sees only hay and pasture. The beauty of the waving grass and grain and the tree standing in outline against the evening sky, the music of the brook and the muttering of the leaves in the wind do not appeal to him. Yet these things are meant to smooth off the rough edges of toil and help a man to keep from being cold and hard and bitter. Any great amount of contemplation of nature may be out of place in the life of a busy man. Yet all with eyes and ears have time to take two or three doses of it a day; and no one ever committed suicide or went out to do some terrible crime as the result of taking such medicine.

*

ONE form of nature study, which should surely be taught in every country school, is a knowledge of our common poisonous plants. A recent report from Pennsylvania tells of the death of three boys, who ate the berries of the Canada moonseed (Menispermum Canadense). This is a native climbing plant, found from Manitoba to Georgia and Arkansas, though nowhere, we think, is it very common. It produces clusters of shining bluish black fruit, which, to the childish eye, strongly resemble frost grapes. The leaves are somewhat like English ivy, but smaller and not so leathery; the vine slender, growing six to 12 feet long. The poisonous property of the fruit is similar in effect to strychnine. The children whose poisoning is referred to met with the moonseed while hunting for wintergreen; ate the berries under the impression that they were grapes, and died within a short time, in spite of medical aid. Moonseed, False hellebore, Water and Poison hemlock, poison oak and ivy, and the deadly Amanita, which is usually responsible for the cases of mushroom poisoning reported each year, should all be familiar to every country dweller, yet we know many who never even learn to distinguish between the five-fingered Virginia creeper and the three-leaved poison ivy. An excellent bulletin entitled "Thirty Poisonous Plants of the United States," has been published by the Department of Agriculture; this does not, however, include the moonseed.

*

No one need suppose that any of us know all that need be known about silage and the silo. The Winter barn pasture is a settled thing on many dairy farms, but no wise man will say that he has yet produced the finest quality of silage that can be made. It was once thought that the chemical action inside the silo was much like that in a jar of preserved fruit. Prof. King says that the two processes are quite different. When fruit is canned the cells of the fruit are killed at once, so that their action is stopped. When corn is cut into the silo the living cells are not destroyed. Their vital action goes on for some time, and this complicates the process of preserving the silage. It is quite likely that a thorough study of the matter may give us an entirely new method of building and regulating the silo.

*

A SINGULAR spectacle was presented on a neighbor's farm the other day. It was at the close of a long hot afternoon. Clouds were gathering in the north and there was a grumble of thunder. The farmer had already done more than a good day's work, but the hay was on the ground, so he dragged himself out with the weary team to save his crop. While he was sweating at the barn two other men were playing tennis in the front yard. They were city men—boarding at the farm. As they played their lazy game the farmer's wife was in the hot kitchen cooking their supper. Strange as it may seem, these men are in the commission business. They handle and sell the products of the farm. There they were, the handlers, playing in the front yard while the farmer toiled at the barn and his wife boiled in the kitchen. It was strange to see the handler play, while the producer worked. We do not mean to say that these players are idle or lazy men. No—they work hard at their business and put in long hours. They would probably say that if the farmer would hustle as they do, and show as good judgment, he would make more money. Perhaps, and yet it was a strange thing to see the handler play while the producer toiled.

*

BREVITIES.

Oh, the practical man he tells us how,
And the scientist tells us why,
And the farmer wipes the sweat from his brow,
And he wonders if help is nigh.
For somehow or other the how won't work
Just when the why says that it should,
Or else the why stops and begins to shirk
And won't do the job that he could.
For half of your labor is thrown away
With why roaming off in a dream,
And how just plodding along till he's gray—
Oh, why can't they work in a team?

BAKED apple time has come!

SOFT drinks after hard thinks.

THE best boss gets along without bossing.

How about the mainspring in your headpiece?

THE Red Astrachan apple is too thin-skinned.

THE cow seems to be having her innings this season.

THE sheep doesn't give the cow a fair show in the pasture.

LEAF gall—some men show it when they turn over a new one.

THERE is one doctor in this country for every 655 inhabitants.

THE hard head needs soft thinking and the soft head hard thinking.

"STRIKE while the iron is hot!" but the present strike turns the iron cold.

GREAT interest has been shown in the recent articles on cranberry culture by Mr. Makepeace.

WHAT crop to sow in the corn for Winter cover? On our own farm we are sure of rye and Crimson clover. Clover and Cowhorn turnips mean an experiment.

REPORTS from the West show great damage to the corn crop. That should make you give your own corn a little better culture or even lead you to sow more fodder!

THE following decision of a New York justice will interest some married people: "No woman has a right to go through her husband's pockets, nor has a husband the right to go through his wife's pockets."

JUST ride about the country in any section where farmers own their homes, and see what a blessing the climbing roses have proved. They are everywhere carrying beauty and sentiment in their teeth as they climb the porch.

QUACK or Witch grass spreads by means of underground stems or roots. To kill it these roots must be exposed to sun and air. A tool that jerks or tosses up the ground is better for this purpose than one that packs it down. A good spring-tooth harrow is excellent.

Is it safe to go down into an airtight silo, or into an old well? The old-fashioned test of lowering a lighted lantern is a good one. If the light continues to burn at the bottom of the silo or at the top of the water man may safely follow. If the lantern goes out—keep out!

Events of the Week.

DOMESTIC.—A prairie fire which started eight miles north of Larned, Kan., July 16, burned over a large extent of country and destroyed over 40,000 bushels of wheat in the stack. Frank Lunod, from whose thrashing engine the fire started, in his endeavor to put it out, inhaled the flames and was dangerously hurt. The residences and barns were destroyed with their contents. Some stock and many tons of prairie hay were also burned. . . . . All records were broken at El Reno, O. T., July 16, by the registration clerks, when 10,967 people were given papers entitling them to numbers in the great drawing for Indian lands, which began July 29. This makes a total registration of 31,015 at El Reno. At Lawton there were 7,800 persons registered in the four days ending July 13. . . . . Manuel Armenta has been convicted at Casper, Wyo., of stealing sheep. He has been tried 14 times in three counties for larceny. In these trials he has cost the State $100,000. He and his followers are said to have driven the range cattle business out of that section. He is a half-breed Mexican and makes his home just south of the Hole in the Wall country. . . . : A boatload of nitro-glycerine exploded in midriver about a mile below Toronto, Canada, July 18. The owner of the boat had just returned to it when the explosion occurred, leaving no trace of the boat or man. The cargo of 240 quarts of nitro-glycerine was going from some upriver point to the oil fields below. The detonation was plainly heard 12 miles distant. . . . . At Sharon, Pa., July 19, two men were killed and three badly injured by lightning, which struck a chimney and passed down it into a room where the men were sitting. . . . . Five employees of the Harlan & Hollingsworth Company, of Wilmington, Del., were terribly scalded July 22 by the bursting of a boiler tube in the torpedo boat Stringham, as it was preparing for a speed test in Narragansett Bay. . . . . At Pittsburg, Pa., July 22, Mrs. Sophie Ratza poured coal oil from a can on to the embers in her stove, to hurry the fire. A terrific explosion followed, and Mrs. Ratza and her three children, aged eight, four and two, were burned to death. Francis Ratza, the husband, suffered severe burns in trying to rescue the unfortunates, but will recover. . . . . Mattoon, Ill., has suffered within a month from 18 fires of incendiary origin, resulting in losses aggregating $2,400,000. The authorities have been very active in destroying gambling outfits, and they believe that the fires are a retaliatory measure.

ADMINISTRATION.—Retaliatory legislation may be enacted by Congress if the German government yields to the demands of the agrarians and imposes the proposed increased duties on farm products. Representations may be made to Germany through Ambassador White, protesting in diplomatic language against the proposed increases of duty, but the President can go no further. There can be no retaliation without action by Congress, as there is nothing in the present law authorizing the Executive Department to adopt such measures, except to a very limited extent.

PHILIPPINES.—Investigation into the case of Capt. Andrew S. Rowan, of the Nineteenth Infantry, charged with burning a town on the Island of Bohol, failed to prove Capt. Rowan had ordered the town to be burned. . . . . The Islands of Cebu and Bohol and the Province of Batangas, Luzon, after three months' trial of civil government, are to be returned to military rule, owing to their incomplete pacification. . . . . According to Manila advices the conferences between Adjutant-General Corbin and General Chaffee will probably result in radical economical and administrative reforms in the army of occupation. The present force is to be reduced to between 20,000 and 30,000 men.

GENERAL FOREIGN NEWS.—The weather throughout Germany continues excessively hot, and numerous sections have suffered severely from hail, wind and lightning. Berlin had a cloudburst July 22, with hail and a whirlwind. Many trees were uprooted and houses damaged. Violent thunderstorms have occurred in the Hartz Mountains. An entire street was burned in consequence of an electric bolt in Stiege. In the Valley of the Fulda hail storms have done great havoc among crops. Some sections report deaths from lightning. . . . . Intense heat prevails in most parts of Austria. The temperature in Vienna rose, July 22, to 99 degrees. Numerous cases of apoplexy and sunstroke were reported. . . . . The two hottest days ever recorded in Christiania, Norway, were July 20, when the temperature reached 94 degrees in the shade, and July 21, when it reached 95. . . . . Mrs. Paul Kruger died at Pretoria, South Africa, July 20, of pneumonia.

FARM AND GARDEN.—Missouri has been highly honored by the jury of awards in the dairy division at the Pan-American Exposition, that State securing eight diplomas, surpassing every State in the West and coming within one-fourth of a point of equaling the best butter made in New York and New Hampshire. The Missouri commissioners are greatly pleased over their success, especially in view of the extreme drought which prevailed over their State while the butter was being made. The highest score, 97¼ points, out of a possible 100, was won by H. C. Goodrich, of Calhoun, Henry County, Mo. The next highest for Missouri were as follows: Holden Creamery Company, regular make, 96; unsalted, 94; East Lynne branch, 95¼; Magnolia branch, 94½; Garden City Creamery Company, 94½; Crosby Creamery Company, 94½; L. E. Shattuc, Stanberry, Mo., dairy class, 96¾.

J. H. Durkee, president of the State Association of County Fairs, says arrangements will be made with all of the county fairs to send collections of first prizes of fruits and vegetables to the Pan-American Exposition during the months of September and October. It is expected that an unusually large and fine collection will be secured in this way.

The Western Association of Nurserymen met at the Centropolis Hotel, Kansas City, Mo., July 9. About 20 members from Missouri, Kansas, Nebraska, Oklahoma, Iowa and Arkansas attended the meeting. The officers of the Association are: A. L. Brooks, Topeka, president; R. H. Blair, Lee's Summit, vice-president; E. J. Holman, Leavenworth, secretary.

Wilton E. Britton, who has for seven years been horticulturist at the Connecticut Agricultural Experiment Station, has received the appointment of State entomologist in accordance with the new law which went into effect on July 1, relative to insect pests. The work to which Mr. Britton is assigned is under the new law transferred to the Experiment Station, and is to be conducted there under the appropriation made by the State. The law provides for the inspection of all nurseries in the State, and stock brought into the State from elsewhere must bear a certificate of inspection under the new law. Mr. Britton begins his new duties at once. He will remain at the experiment station.

The wheat crop of the Canadian west is very large this season. It is thought well within the mark to estimate that Manitoba and the Territories together will have 55,000,000 bushels of wheat this year, or, deducting 10,000 bushels for food and seed, about 45,000,000 bushels for export. The largest crop on record was that of 1895, when 32,000,000 bushels of wheat were reaped in Manitoba, and 3,500,000 in the Territories, but the area was only about half of what it is to-day. Putting wheat, oats and barley together, there will be an aggregate yield in Manitoba of 80,000,000 bushels at least, since the oat crop is certain to amount to at least 25,000,000 bushels, while barley will exceed 7,000,000. In short, taking it all around, this is by far the fattest year ever experienced in the Canadian Northwest.

CROP PROSPECTS.

JULY 18.—Making hay and cutting oats will be finished this week, both about one-half crop; potatoes one-third crop; pasture short. Corn is remarkably clean and will make a good crop but is needing rain now; had a good rain July 4, but ground is so dry that we need another badly. Potatoes are 80 cents; oats, 30; corn, 45 cents per bushel; apples a small crop; have dropped badly; worth 50 cents per bushel. Blackberries are a large crop, worth $1 for 24-quart case at station. Fine prospect for peaches and pears. Strawberries a good crop and good prices.

Farina, Ill. B. D. C.

JULY 19.—In this section corn will be a very light crop; poor stand on account of worms. Much of it was planted late. If the present dry hot weather continues potatoes will be a light crop. It cannot be more than medium at best. Apples are very light, and will be poor quality, from present indications. The hay crop is heavy and is being well secured. Oats generally good. We have had quite fair success with Fall seeding of Timothy, without foster crop the present year. The greatest trouble we have in getting a stand with Fall seeding is with grasshoppers. They sometimes destroy it completely wherever it joins meadow land. We have some seeded last September that will cut nearly two tons to the acre. L. G.

Beaver Center, Pa.

JULY 20.—Late planted crops need rain badly; many pieces of corn and potatoes cannot be more than half a crop, and they need more cultivation, as the planting and haying were so close together and help so scarce that many pieces of corn have not been worked more than twice. Clover has given a greater bloom than for many years; some was cut early in hope of a crop of seed, but the present dry weather is against that. Yet those who cut clover early, also mixed hay, have secured some fine hay, very bright and nice, while the late ones have had to put up with hay that looks as if it had been rained on, while not a drop of rain touched it. Wheat was badly infested with fly. On my own farm one piece sown after silage corn was cut off was about half ruined. At present it looks as though the acreage will be greatly reduced this Fall, and there will be a call for red wheat of a stiff strawed variety. Barley and oats will hardly be a full crop. Many pieces of oats are too short to bind. Corn, one of the most valuable crops to the farmer, will be greatly deficient, yet some very fine crops are noted, especially silage and common field varieties. Sweet corn did not come well, and is very much spotted. Potatoes are the most varied crop, from a good stand to very poor. Pastures have been very good in a few places, especially on the milk dairy farms; they are short on account of the great growth early in the season. Less acreage was given the cows and more hay cut. Where oats and peas have been substituted or silage fed the milk flow has been kept up. One milk seller is at present feeding heavily on grain and buying the milk of 19 cows once a day of his neighbors to keep up his supply, he himself milking nearly 40 cows and drawing the refuse from a canning factory for feed. I note he has the foundation for two silos. Fruit, especially berries, has been plentiful. No cherries except a few sour ones. Apples are scarce, except King, Greening and early ones, such as Red Astrachan, Maiden Blush, etc. A. D. B.

Aurelius, N. Y.

JULY 22.—Corn, although planted very late on account of the wet Spring, is looking well and growing rapidly. Feed in pastures is unusually good for this season of the year, the frequent rains having kept them fresh and green. Prospects now are that farmers will not have as large feed bills the coming Winter as they did during the last. Cows have given a good flow of milk and are holding out fairly well. The Chenango Valley Dairy Company is receiving at its coöperative creamery 200 cans of milk per day. All this cream is now sold in Philadelphia and Buffalo. The skim-milk is made into curd. The Empire State Dairy Company is getting considerable milk, but gets it at quite a distance from the station, the hot weather making such a demand for milk that the company is buying from cheese factories to increase the supply. The price since July 1 has been 64 cents per can; for June, 54 cents per can. The Chenango Valley Dairy Company paid for June 65½ cents per can. E. C. J.

Greene, N. Y.

JULY 22.—The central and northern part of this county is feeling the effects of the hot and dry weather. Plenty of rain in southern part. With the exception of a few fields here of Dawson's Golden Chaff the wheat crop is the nearest to an utter failure I ever knew; too many Hessian fly. Oats have a wonderful growth. Haying is about done; crop heavy. Beans are looking fine; planting fully as large as usual. I am inclined to think that the acreage to cabbages is about 20 per cent greater than last year. Cabbage is looking fine for this time of season. Cherries are nearly a failure. I don't see or hear very good reports of pear crop; apparently, considerably less than last year. Of apples we have hardly enough to talk about. If there is a barrel now growing, where 10 grew last year, I am unable to see or hear of it. I was talking recently with seven or eight apple growers, who raised last year from 700 to 4,000 barrels each; they were asked their opinion of the signs of the crop, taking 10 years for an average. Answers ranged from 10 to 25 per cent; the man estimating 10 per cent is owner of a large cold storage plant, and has had a wide range of sight-seeing among the orchards. Peaches from light to fair. H.

Albion, N. Y.

The Bean Crop in Western New York.

At the present time I think the prospects are favorable for a fair crop of beans. How much damage will be done by a maggot that is now eating the beanstalk off I cannot tell. Already a few fields have been plowed up in this locality. The acreage is rather large. I have noticed no blight on beans. J. B. COLLAMER.

Hilton.

I have been riding several days, and think the acreage of beans is larger this year than for some time, but do not think there will be a large yield, as so much wet weather has packed the surface, and now the ground is baking. We should have rain soon or beans will not turn out much better than last year. It is too early to give more than a guess, but do not think there is any blight or rust yet. The weevil or fly took some pieces quite badly, but pieces that had a good application of phosphate got out of the ground before the bug got in his work. C. A.

Orleans Co.

Owing to the late, cold, wet Spring, the usual amount of barley and oats was not sown. This, together with continued high prices of beans, stimulated farmers to plant a much larger acreage than at any time since 1895; I think 75 per cent more than in either of the last two seasons. The soil and weather conditions were very unfavorable for early planting, but later, farmers were enabled to complete bean planting. On many pieces beans were destroyed by grubs, before and just after they were up, but in most cases they were replanted. In other instances, the damage to the crop by the grub was so slight that replanting was unnecessary. It is too early for blight of any kind, and if injury comes from this source it will be later. On the whole, the prospect is favorable for a large crop of beans, but drought or blight may change the present outlook. Few beans of any kind have been planted except Medium and Pea, the latter predominating. S. C. BOWEN.

Medina.

At present beans are doing exceptionally well. The farmers experienced great difficulty in getting the seed into the ground on account of the heavy rainfall which occurred during the latter half of May and first part of June. However, the seed was all finally got into the ground, and made a very quick germination on account of the warm and moist condition of the soil. We have had frequent showers and warm weather, which has materially aided the development of the young plants, and should these conditions continue throughout the season we will have a very large crop. However, it is as yet altogether too early to make any estimate of probable yields, as the vines are simply making growth, none as yet even being budded. It is too early for the blight to make its appearance. We have heard of a few instances in which the cutworms have seriously injured the young plants. We think the acreage this year is fully up to that of last season, if not a little in excess. The crop will mature later this year than usual on account of the late planting. N. B. KEENEY & SON.

Le Roy.

Wheat and Hessian Fly.

The fly is practically unknown in this locality. I never hear it spoken of except by eastern men. Nothing but Spring wheat is raised here. The chinch bug is taking hundreds of acres of grain this year. When the small grain is ripe the chinch bugs take the corn and grass. A. R. T.

Hampton, Minn.

There is not as much trouble from the fly as was expected in the early Spring. The wheat crop is very good in this locality, 20 to 25 bushels per acre; some more, some less. The varieties grown here are Fultz and Pool; some are raising the Democrat; not many. I do not think any one variety more liable to damage from the fly than the other. W. P.

Windsor, O.

My experience with the Hessian fly is rather limited, but I am inclined to believe that the location of wheat-field has more to do with the ravages of the fly than the variety. Last year at least 90 per cent of wheat crop was destroyed by the fly, in this section, and I believe that only the sand knolls had enough on to pay for cutting, though the whole of the fields were sown to the same variety. Elevation of field or character of soil seemed to cut more of a figure than did variety. M. J. P.

Clyde, O.

Crop and Weather Report.

The intense heat continues throughout the central valleys and the section east of the Rocky Mountains, with only slight relief from local showers. On the Pacific coast the weather continues unseasonably cool, and there has been a decided drop in temperature in the North Atlantic States. In the Southeast there has been an excess of rain. The most critical conditions are now seen in the Central West. In Kansas, Nebraska and Missouri early corn is practically ruined. Rains would give the late-planted a chance to make at least half a yield. Spring wheat harvest has begun in the southern portion of the belt, where the excessive heat has caused premature ripening. The conditions are more promising in the extreme north. The outlook for grain of all kinds in Washington is very favorable, and it is thought that the yield of wheat will beat all previous records. Oats and wheat in shock in the Middle States have been somewhat damaged by rains. Haying throughout the entire country is finished, good crops having been secured in the Ohio Valley, Lake region, North Dakota, Minnesota, and parts of the East. Cotton conditions in Mississippi, Alabama, Georgia and Florida have improved. In the Carolinas it is suffering from lack of cultivation. The prospects for apples both east and west are still further reduced.

Woman and Home

From Day to Day.

THE FISHIN' FEVER.

'Long about this time o' year, I sort o' git a wish
I c'd jis' cut loose a spell an' fish an' fish an' fish;
Gittin' all-fired weary of th' stuffy, sweaty town,
Want to go where I can hear the water trieklin' down
Thru a medder summers an' in underneath a tree,
Where th' ol' sun kind o' peeks an' shimmers down at me,
Set there by a pool an' smoke an' think an' fish. Why, sir,
'Long about this time o' year that's wuth a livin' fer.

One day saw a little gal a dabblin' of her feet
In a gutter stream that made a puddle in the street,
Sittin' there upon the eurb an' keepin' mighty still,
Had a bent pin on a line an' fishin' fit to kill.
I stood there a aehin' fer to hug that kid an' say,
You're all right, an' this ol' man is feelin' jis' that way.
'Long about this time o' year fer workin' I ain't fit;
Got the fishin' fever on an' eain't git over it.

Want to git out all aione an' set a dreamin' dreams,
Want to smell the pine trees an' to hear th' mountain streams;
Want to git on top th' range an' waller in th' snow,
Then look down an' see the world a mile er two below;
There is somethin' magie in a breath o' mountain air,
Makes a feller feel somehow that God Himself is there.
'Long about this time o' year, w'y, don't you understand?
Want to go to Nature an' to grab her by the hand. —Denver News.

LONG, narrow bows of tulle, either black or white, are one of the newest hair ornaments sold, taking the place of the velvet Alsatian bows. The bows are about 1½ inch wide and four or five inches long, drawn out straight and square. They are worn in front of the coil when that is put up on the top of the head.

*

THE Household tells about a small boy whose piety was stronger than his memory. His Aunt Jane, hearing a little noise at her door, opened it to find little Willie kneeling there. "What in the world are you doing on my doorsteps, Willie?" "Oh, Aunt Jane, I was only saying my prayers. I forgot to say them this morning. I happened to remember as I was going to school, so thought this would be a good place to do it. Do you care, Aunt Jane?"

*

WE were buying shoes, recently, in a famous New York store, and near us sat a well-dressed woman, surrounded by a barricade of shoes and slippers of all sizes. A patient salesman tried on shoe after shoe—kid, patent leather, calfskin and canvas—square-heeled Priscillas, with high tongue and broad buckle, spindle-heeled Louis XV. slippers, and sensible Oxfords, without making a sale Finally the woman rustled away without purchasing. Another salesman asked the man who had waited upon her some question about the dissatisfied woman. "Oh, she wasn't a customer," he responded, "just another of those boarders." It is a fact that there are many women boarding to avoid the cares of housekeeping, too vacant-minded to interest themselves in rational pursuits, who spend a great part of their time in going about the stores, not only pricing things, but also trying on garments they never intend to buy, merely for the sake of passing away the time. The leisure that many a hardworked woman longs for is to them merely an encumbrance. Apart from the actual uselessness of such lives, they add much to the burden of others by their senseless demands upon the time of busy people.

*

THE price of glass has been advancing in all lines, and it seems that fruit jars are to feel the increase strongly. Buyers and dealers predict that there will be less fruit put up by housewives in consequence, and the price of canned goods, which has been soaring skyward for some time, can be depended upon to continue going up. The glass trust is of course the leader in this advance, but the few independent makers of glass jars appear to be increasing prices also. One trade journal says that if the manufacturers of glass fruit jars are wise, they will flee from the wrath to come. Trusts may trifle with men and double the prices of everything from chewing tobacco to armor plate, but when they invade the realm of woman and fool around with the prices of things she cannot do without, it is time to set the alarm clock for war.

*

NEW ideas in lamps show shapes not quite so squatty as they have been, nor so tall as the banquet lamps. Green bronze, such as we see in antique lamps, is especially fashionable, a vase-shaped oil reservoir of this material being very handsome. Antique styles in brass, copper or terra cotta, modeled after Roman, Grecian or Egyptian lamps, enjoy special favor. Highly decorated porcelain seems less cared for. Very beautiful shades are seen in novel effects of iridescent glass. The Empress shades of delicate wall paper or glazed French chintz, finished at top and bottom with a close ruche, retain favor, especially in delicate shades of green, pink or yellow, with white. The globe shades always remain in fashion, but they are rather more subdued in coloring, and not quite so large as with the low squatty lamps.

*

GOATS are credited with very unusual tastes in food, but we have only once heard of a goat which ate a school composition. The Youth's Companion tells this experience of a bright little eight-year-old school girl. The class, for the first time, had been asked to write a composition at home, and bring it for criticism the next day. A moment after the school-bell had rung little Amy, panting and red-eyed, stumbled to her desk and dropped her face on her arms, her shoulders shaking with sobs. The teacher went to her and tried sympathetically to find out what was the trouble. Amid piteous sniffs and gasps she thought she caught the word "composition."

"Didn't you get your work done, Amy?" she asked, kindly.

"Oh, yes!" sobbed Amy, in a burst of indignant grief. "I g-got it d-done, Miss Brown, but B-b-billy Smith's horrid g-g-g-goat chased me and ate it up!"

Common Sense, M. D.

"What ridiculous nonsense one sees in the papers," I remarked, throwing aside the one I had been reading, as my friend joined me on the veranda.

"For instance?" she said.

"I was thinking especially of the hints on health. A doctor told me once that if I did all the things that were recommended in the papers I would not do anything else—and not that for long. They are so contradictory. Really, if credulous people should read the papers carefully and follow all the advice, even if they were perfectly well to begin with, I believe they would be seriously ill in less than a month."

A REMODELED CLOSET. FIG. 234.

"There is once in a while a good suggestion, in fact, I think most of them are good for some people and perhaps some of them good for all people."

"But how is one to judge?"

"Do the way a friend of mine does. She reads everything of the kind and then refers all the ideas to her family physician."

"Rather expensive," I suggested.

"Oh, no! Her physician is called Dr. Common Sense, and he is the only one she has had for more than three years. She maintains that in treating her own case she has the advantage over the best doctor in that she knows just exactly how she feels. And as she has no organic disease, she thinks she can be her own doctor. It certainly has worked well so far, as she says she never felt better in her life than she has the past three years.

"She reads a great many of the articles in the papers about health, as she is interested in the subject, but she adopts few of the hints, and those she tries cautiously. At the first she gave up drinking hot drink and cold water with her meals. She eats very little meat, and every night, before going to bed, she drinks half a cup or so of hot water. She eats plain coarse food, drinks milk, has plenty of fresh air night and day, takes a daily sponge bath and has a proper amount of exercise and sleep.

"Now this way of doing might not work well with another person, but you see she understands her own needs. She maintains that different people require different treatment, and that it is one's duty to study one's self and find out how to keep in the best possible condition. When away from home it is well to conform to the ways of those one is with, otherwise one may be called cranky, notional and old-maidish. I think it pays to be a crank, that is if crankiness consists in keeping one's self in good health, and for my part I mean to keep right on."

"Ah, I thought you were talking of your own case," I said quietly.

"There, I did not mean to let you know!" and she laughed at herself, a little vexed. S. B. R.

An Abbreviated Bed.

This idea, says a writer in Trained Motherhood, may be of service to other women with children who have outgrown their cribs, and who must be provided with large sleeping quarters. I shortened the side pieces of an inexpensive white iron bed, so that when put up, it measured four feet eleven inches. A country blacksmith did the work, and charged me but 40 cents. He cut the sides in the middle, lopped them to the required length and fastened them together with iron bolts, two on each side, so the bed is as strong and steady as before. It was not an hour's work to shorten the mattress, and I managed to cut the wire spring at home also, but the assistance of a man was necessary for that operation.

The bed described above is long enough to accommodate a child comfortably, until he is nine or 10 years old, and one feels well repaid for the slight labor and expense, when the cunning proportions of the result are seen. I have found that to have things for their *very own*, gives children real happiness, and any child will be delighted with the change from a long, narrow, unattractive bed to this little affair, which, besides, takes up so much less space, and adapts itself so readily to the shape of almost any room. When buying the iron beds, one can order the sides to be made any length desired, and the mattress and springs are then bought to fit, but with me it was necessary to utilize the material which was on hand.

The result of the single bed was so very satisfactory that I shortened also the sides of a double brass bedstead, making the length to correspond with the larger portion of the mattress, using slats instead of the springs. This makes a child's pretty double bed, and, of course, allows much more space in the bedroom, and when five or six years have added that much more length to the four little legs which, until then, can comfortably occupy it, it may easily be returned to its original size by the addition of another piece of iron, held in place with several bolts, while the hanging spread will completely cover any rough appearance of the patching.

A Remodeled Closet.

In THE R. N.-Y. for March 17, 1900, an illustration was given of a remodeled closet, turned into a bookcase and writing desk. One of our readers followed the suggestion there given, and the result, shown at Fig. 234, is much more attractive than the original picture. It is a great convenience, and takes up less space than an ordinary bookcase. A shallow closet is more useful in this form than in its first estate, and the same plan may be followed with a disused doorway between two rooms.

"AFTER much meditation and experience I have divined that it takes as much sense and refinement to cook a dinner, wash and wipe a dish, make a bed as it should be made, dust a room as it should be dusted, as goes to writing a novel or shining in high society."

A Reading Course for Farmers' Wives.

The Cornell Farmers' Reading Course has awakened so much interest in New York State that a similar course was suggested for women, and a circular letter sent out, asking for opinions on the matter. The suggestions and opinions received in response to this resulted in the publication of two bulletins known as reading lesson supplements, the first being devoted to saving steps, and the second to home sanitation. Here are some ideas from farm housekeepers, suggested in the first bulletin:

"As a rule, we farmers' wives do our own washing, ironing, taking care of the milk, meat, chickens, which women of other callings do not do. If you can make us understand that it is just as necessary to rest the body by using the mind a little to read—if the floor doesn't get scrubbed so often—you will do much good.

"Before beginning to get a meal, stop and think how many things one will need from the cellar, and bring up as many as possible at one time, and not climb the stairs as many times as there are articles needed."

"I think that many of the unnecessary steps I take are caused by forgetfulness; another cause of extra steps is putting up things that some one else has left out of place. I find a great saving in having the stove near the sink and cupboards."

"When we visit a neighbor and she gives us about three times as many kinds of food as we need, what is there left for us to do when she visits us?"

"I tried to count my steps while getting breakfast this morning. I traveled about two miles while preparing this meal, doing the dishes, preparing chicken feed, pig feed, and waiting on the children, for I have five small ones."

"What housekeeping needs is just what farming has needed—the application of thorough scientific knowledge and methods."

"My kitchen is off from the main part of the house about seven feet, and there are two steps for me to go up and down. I often wondered just how many times I went back and forth in a day. One morning I counted 20 times."

"It is wealth to the farmer whose wife's steps are made few, and everything about the house as convenient as possible, securing her health in order that she may be the helpmeet of her husband."

"Build the sink and tables high to avoid stooping. A high stool should stand in every kitchen, upon which the mistress can sit while compounding foods, washing dishes, and cleaning vegetables."

The editor, Miss Van Rensselaer, in reviewing these letters, gives some wise hints. For the housekeeper who now has to carry waste water to an outside door, down a flight of steps and to a safe distance from the house before throwing it on the ground, a tiled drain should be constructed. Tile can be had for four cents a foot; the drain should be laid according to the situation of the well. If the work is done by the farm help, the actual cost will be about $6.25 for a permanent means of carrying off the waste water used in the kitchen.

An ice-box should be constructed and this can be homemade. The provision saved in one season by the use of a refrigerator more than pays the expense of one, and saves the housekeeper many trips to the cellar. A large ice house at the creamery may answer for a community, and the patrons who bring the milk may carry away the ice needed for their own homes. A window cupboard in dining room or pantry saves many steps. In a small kitchen a drop shelf is an advantage, and zinc-covered tables are helpful.

Miss Van Rensselaer states that nearly 6,000 women in the State of New York are enrolled in this Women's Reading Course. The old farmhouse as it was is described in the bulletin on sanitation. A brook flowing through the farm acres may bring dangers from above or acquire them here and transmit poison to the lands below. At the side door for many a year a woman has appeared several times a day to fling the contents of a dishpan as far from her as possible. Here, too, the water from washing clothes, hands, and milk cans, joins to make a soil rich in bacteria, and in similar cases this too often is near the well. Other wrong conditions discussed by this bulletin are the unused parlor and spare room, the clothes-line at an exposed corner of the house, and the cellar which is not properly drained. Many

3869 Girl's Dress, 4 to 12 yrs.

improvements with small outlay of money or labor are suggested, such as good drains, a drilled well, a cement floor in the cellar. Sanitation usually appeals more strongly to women than to men, and much depends on them, although in many cases it seems impossible to overcome the difficulties.

The Rural Patterns.

Dainty frocks with many tucks are as much in style for little girls as for their elders. The charming little model illustrated is suited to many materials and has the merit of being childish and simple at the same time that it is effective in the extreme. The original is of fine, sheer mull with Valenciennes lace threaded with narrow black velvet ribbon; but lawn, batiste and all the long list of white and colored washable fabrics might be substituted, or any one of the simple silks and wools. The waist is tucked to yoke depth and falls in folds below, and the novel sleeves show tucked caps. The skirt is simply straight, gathered at the waist, and can be made with the flounce or plain as preferred. The trimming of lace insertion is applied to form vandyke points and to cross the yoke in becoming fashion. To cut this dress for a girl eight years of age, 8¼ yards of material 21 inches wide, 5¼ yards 27 inches wide, 4½ yards 32 inches wide, or 3¾ yards 44 inches wide, will be required, with 17 yards of insertion and two pieces of velvet ribbon to trim as illustrated. The pattern No. 3869 is cut in sizes for girls 4, 6, 8, 10 and 12 years of age; price 10 cents from this office.

The very complete assortment of stocks and belts here given includes the soft bow, four-in-hand and butterfly ties, plain, draped and bodice belts, and will enable any deft needlewoman to make half a dozen for the cost of one ready-made. The materials for the originals are dotted silk, louisine silk, white mull and white piqué; but almost anything and everything is used, and there is ample opportunity offered for individuality in the choice both of materials and color. The foundation for all the stocks is the same. The plain one in the center is shown with the butterfly tie that appears separately just below. The four-in-hand model is trimmed with stitched bands and has the tie joined to the back edges, where it crosses and passes round to the front. The bow includes turn-over portions, but is the same familiar friend. The belts are well fitted and curve to the figure to give a graceful outline. The plain and the draped ones are eminently simple, but are stylish as well. The laced bodice is cut in sections and fits to a nicety, and can be closed at back or front as preferred, made pointed or cutaway as illustrated. To cut the stocks with ties in the different styles, ⅞ yard of material 32 inches wide will be required. To cut the belts, one yard 21 inches wide will be required. The pattern No. 3861 is cut in one size (medium) only; price 10 cents from this office.

3861 Stocks and Belts, Medium Size.

Rural Recipes

Pineapple Short Cake.—Make the cake with a short baking powder biscuit dough; peel and grate the pineapple and add a cup of granulated sugar (more may be added if it is very acid); let it stand two or three hours before needed; when the cake is done (it should be baked in two parts, with softened butter between the cakes) separate the cakes, butter and spread each layer with the prepared fruit; for the top layer make a meringue with the whites of two eggs beaten stiff with two tablespoonfuls of pulverized sugar added; brown lightly in the oven with door open. Serve hot.

Pickled Cherries.—Five pounds of cherries, stoned or not, as preferred; one quart of vinegar, two pounds of sugar, one-half ounce of cinnamon, one-half ounce of cloves, same amount of mace, all ground. Boil the sugar, vinegar and spices (tie the latter in a bag) together, and pour hot over the cherries.

Gillespie Relish.—One peck ripe tomatoes, two cupfuls celery, six large onions, seven red peppers. Run the peeled tomatoes and the onions through a meat grinder. Chop the celery and the peppers fine. Add two ounces of mustard seed and ground cinnamon, one-half cupful of salt, three pints cider vinegar and two pounds of light brown sugar. Mix and seal. Do not cook. It is claimed that this will keep perfectly for five years, and it is very appetizing and universally liked.

Pepper Hash.—Wash and dry five large green peppers and one red one, remove seeds and chop shells quite firm; chop fine a good-sized cabbage, and place with the peppers in a bowl, mixing well. Add two tablespoonfuls of brown mustard seed, three tablespoonfuls of salt and enough good cider vinegar to cover the whole. Stir well together and put into pickle bottles. Ready for use in two days, or will keep for Winter use.

Egg-plant Rissoles.—Wash and cook a large eggplant in boiling water for half an hour; cut in halves. Scoop out the inside, mix it with two beaten eggs, one cupful bread crumbs, a teaspoonful of salt and two dashes of paprika. Form into small oblong rolls and fry to a delicate brown.

Baked Egg Plant.—Select one that is firm and fresh, peel it and cut it into quarters. Let it lie half an hour in salted water. Put it into boiling water with a teaspoonful of salt. Cook until it can be easily pierced with a fork. While the plant is cooking cut one medium-sized onion into small pieces and cover it with salt water. In 10 minutes pour off the water and put the chopped onion into a hot pan, with a tablespoonful of butter. Cook until it is thoroughly tender and brown. Drain the egg plant in a colander, put into a bowl, stir with a silver fork until it is broken up, but not mashed. Mix with it an equal quantity of rolled bread crumbs, add the browned onion and one well-beaten egg. Season with a dash of salt, two dashes of pepper, and add a dessertspoonful of butter. Put the mixture into a well-buttered earthen dish, bake just long enough to be nicely browned. Serve hot in the dish in which it is baked.

Stuffed Tomatoes.—Cut the tops from six large tomatoes and remove the inside pulp. Mix two tablespoonfuls bread crumbs, one of chopped parsley, one-quarter pound of finely minced ham, one-half tablespoonful butter, juice of half a lemon, a dash of cayenne, the well-beaten white of one egg and the pulp of the tomatoes. Stuff the tomatoes with this mixture, replace the tops, lay them in a well-buttered baking dish and bake one-half hour. Lay each one on a slice of toast well buttered and garnish with parsley. Serve very hot.

Hot Chicken Loaf.—Mince fine two cupfuls of cold cooked chicken, one pound of lean veal and one-fourth pound of fat salt pork. Work in these three beaten eggs, a cupful of seasoned and strained tomato sauce, one teaspoonful of grated lemon peel, one teaspoonful of salt, one-fourth teaspoonful of paprika and enough cracker crumbs to mold with the hands. Press firmly into a large wet bowl, invert carefully into a buttered baking pan, removing bowl. Add one cupful of water and one tablespoonful of butter to the pan. Sift buttered crumbs lightly over the loaf and cover the top and sides with carefully peeled and sliced lemons. Bake 1½ hour in a moderate oven, browning it nicely before serving. Baste frequently with the liquor. Serve garnished with lemon slices and parsley.

LIFE is a long chaplet of little miseries, which the philosopher shakes with a laugh.—Dumas.

THE offender's sorrow brings but small relief to him who wears the strong offence's cross.—Shakespeare.

ROUND SILOS

LABOR 1-2 SAVED.

Also best Horse-power, Thresher, Clover-huller, Dog-power, Rye Thresher and Binder, Fanning-mill, Feed-mill, Saw-machine (circular and drag), Land-roller, Steam-engine, Ensilage and fodder-cutter, Shredder, Root-cutter and Corn-sheller.

GEO. D. HARDER, Manufacturer, Cobleskill, N. Y.

☞ Please tell what you wish to purchase.

BUSINESS BITS.

THE round silo is now the popular kind with dairymen; it is more convenient, easily put up and less expensive than others. Harder's patent round silo has all the latest improvements, and every essential for the perfect preservation of silage. Write Empire Agricultural Works, Cobleskill, N. Y., for full information and prices.

WE note with pleasure the partnership of T. E. Orr and A. F. Cooper to put Orr's insecticides, germicides and disinfectants on the market. Orr's fly killer, it is claimed, contains no tar or fish oil, is clean and easily applied. The names of the men behind it are sufficient guarantee that it will do all that is claimed for it. Address Orr & Cooper, Pittsburg, Pa.

WE call attention in this article to one of the many styles of Champion hay presses manufactured by the Famous Mfg. Co., of Chicago. This machine is what is known to the hay press world as the Champion steel belt press, with side and end moving wall condensing hopper. A card to the Famous Mfg. Co., Chicago, Ill., will bring their latest catalogue, with full description of their entire line.

WE call the attention of our readers to St. Mary's Academy, Notre Dame, Ind. We do not need to expatiate upon the scholastic advantages of St. Mary's, for the catalogue of the school shows the scope of work included in its curriculum, which is of the same high standard as that of Vassar and Bryn Mawr, and is carried out faithfully in the class rooms. Catalogue will be mailed to all applicants.

WE are in receipt of an encyclopedia issued by the American Well Works, Aurora, Ill. This is a book of 176 pages. It contains illustrations, descriptions and prices of machinery demonstrated to be the most practical, including well sinking, prospecting, pumping, irrigating and hoisting machinery; water hoists, Chapman's air water-lifting systems, gasoline, gas and steam engines, boilers, etc., all of their own manufacture. It is a valuable work for anyone intending to engage in any way in the well-drilling business.

A New Cure for Hay Fever.

Dr. H. H. Curtis, of New York, gives in the Medical Record some interesting facts about a proposed new cure for hay fever. Several years ago he found a case of a woman who was unable to endure the perfume of flowers. A bunch of flowers brought into her room would drive her into a severe attack of hay fever. An experiment was made to see whether the watery extract of certain flowers and their pollen would not remedy the trouble. The sterilized infusion of roses was first given, both internally and hypodermically. After two weeks it was found that the patient could tolerate the rose in her bedroom, and the use of the extract of violet and lily-of-the-valley was also successful. After becoming immune to these three flowers, it was found that she could endure the perfume of others. A number of similar cases suggested a cure for ordinary hay fever which is usually caused by the pollen of ragweed. An extract of the flowers and pollen of ragweed was made, and last year it was tested by about 100 afflicted persons. Dr. Curtis concludes that about 60 per cent of such cases may be cured by use of the extract. Those who suffer with this distressing and painful disease will be glad to know of anything promising relief. Those who suffer from ragweed on our farms will be glad to learn that the pest really possesses virtues. We have observed how hogs and sheep, when closely confined, are eager for this weed.

Not one half the patients supposed to be suffering from Consumption really have that distressing disease—though ofttimes the symptoms from which they are suffering lead to it. Nearly every case of this kind Dr. D. Jayne's Expectorant would cure.—*Adv.*

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER

THE AMERICAN FRUIT CULTURIST, by John J. Thomas. Practical directions for the propagation and culture of all fruits adapted to the United States, with full, illustrated descriptions of varieties. Price, postpaid, $2.50.

FERTILIZERS, by E. B. Voorhees. The source, character and composition of natural, homemade and manufactured fertilizers, and suggestions for their use for different crops and conditions. Price, postpaid, $1.50.

THE SURVIVAL OF THE UNLIKE, by L. H. Bailey. A collection of evolution essays suggested by the study of domestic plants A most interesting work for those who care to investigate the variation of type and habit of plants. Price, postpaid, $2.

CUT-PRICE BOOKS. Any of these 20-cent books sent postpaid on receipt of 10 cents:

My Handkerchief Garden.
Accidents and Emergencies.
How to Plant a Place.
Modification of Plants by Climate.
Tuberous Begonias.
Cooking Cauliflower.
Ensilage and Silo.
Country Roads.

MARKET NOTES

MELONS.—The hot weather has made an active demand, and watermelon prices continue high. There is more than the usual complaint of small sizes. Muskmelons are very irregular in quality. Anything that can be classed as fancy brings high figures.

TOMATOES.—Large quantities of the Jersey crop are now on hand, and the few remaining receipts from the South are selling at a discount. The highest price noted is $2 per bushel box for Jersey Acme. This is excessive, and $1 to $1.50 will cover the bulk of the sales.

BUTTER EXPORTS.—Shipments to Europe during the month of June exceeded 2,300,000 pounds. This was about double the amount for the same month last year, and was a much larger business than had been looked for by the trade. This increase is partly accounted for by drought in Continental butter-producing districts. The price for extra creamery—19 to 19½ cents—was the highest that has been realized throughout June for six years.

CALIFORNIA BARTLETTS.—With the exception of the orange there is no fruit from the Far West that sells better in this market than the California Bartlett pears. They are now seen on the fruit stands and pushcarts throughout the city. The price for the best is never low, seldom under three for 10 cents, and they sometimes sell for five cents each. Many are larger than any eastern Bartletts I have seen; and, while of no better quality, they strike the market much earlier, at a time when there are no other prime pears to be had. It is very doubtful whether they could be sold at such prices a little later in the season, after nearby pears begin to arrive in barrel lots. It is quite probable that, if eastern growers would sort and pack a little more carefully, keeping the small and worthless stuff for hog feed, the better fruit might, under those conditions, sell for more than is received for both good and poor at present. It may be said that this would deprive many poor people of the fruit which they get at low prices, but it is not unlikely that this might prove a good thing, as knotty or half-decayed stuff that they get at such low prices is worse than worthless. W. W. H.

THE BEET-SUGAR EXHIBIT AT THE PAN-AMERICAN EXPOSITION.

In one of the galleries of the Agriculture Building may be found, in a prominent place, the exhibit of the beet sugar industry of the United States. It is under the personal charge of M. E. Gilmore, of Nebraska, who is prepared to answer almost any question that may be asked him by farmers and others who are interested in this subject. Almost everything pertaining to the growing of the beets, extracting the saccharine matter, the crude and refined sugars, the syrups and other by-products is shown. There is an exhibit of candies made from beet sugar. There is also a model of one of the beet sugar factories, and a practical working model of Henry Vallez's triple osmose process for extracting the sugar from the residuum molasses. Near the Government Building a plot of ground is occupied with beets in the growing state, the seed having been planted by Mr. Gilmore, and the work done under his direction or with his own hand, thus illustrating to visitors just how the beets are grown.

As much as has been said on the subject of beet sugar and its production, it may not be generally known that at least half of the sugar consumed by the people of the United States is made from beets. It is also, perhaps, new to many, that there is no difference whatever between beet sugar and that made from the cane which is in the tropics, or from sorghum, either chemically or from any other standpoint. On the contrary, it is the opinion of many that beet sugar is not of the same composition as cane sugar and is not so economical to use, and the sooner this mistake is dispelled from the minds of our people the better. Three-fifths of the sugar made in the entire world is made from beets, a large proportion of which is made in Europe. We import annually over $100,000,000 worth of sugar; in other words, we spend three-fourths of the equal of our corn crop in this way; and this is done in the face of the fact that we could grow all of this at home, and thus become exporters. The area available for beet culture in the United States is fully 20 times greater than that upon which the tropical cane can be grown from which sugar is commonly made, sorghum now having been discarded for the production of sugar, owing to its cost.

Putting it in another way; we pay for our foreign sugars $1.35 annually for every man, woman and child in the United States. Home production is one of the economic principles which we should study, and when we can produce at home more cheaply, or even as cheaply, any article, we ought to produce it rather than send our money to foreign countries to enrich them. This will provide our own people with labor, about which we are constantly crying. The farmers can make good use of their land, and thus get a profitable return from it. The salaries of experts and wages paid to laborers working in the factories also help to keep business alive. The average production of cane sugar per acre is 1.75 tons, while an acre of beets will average 1.07 tons. This is raw or unrefined sugar. A ton of cane yields on the average 150 pounds of sugar, and a ton of beets 200 pounds of the same. Taking the average production of cane sugar in the world, it costs $62 per ton, while a ton of beet sugar, taking the world into consideration, averages $53.50 per ton, which is a net saving of $8.50 per ton in cost of production. The by-products of the beets, that is, the tops and the pulp which is left after extracting the sugar, are both valuable as stock feed or for manure, while the refuse from the cane mills is of little or no value, except as fuel in some rare cases. The time has doubtless come when beet sugar will be very extensively produced within the United States, and it is quite time that our people should become enlightened upon this subject. Secretary Wilson says: "We have no more need to import sugar than to import wheat."

H. E. VAN DEMAN.

Western Water Mining.

Water mining is a new and profitable business in the Far West. While the surface of these plains is too dry to produce ordinary farm vegetation there is a large supply of underground water. The water-bearing rocks come reasonably close to the surface in some localities, and the object of "water mining" is to find just where these rocks are, so that they may be tapped. N. H. Darton, of the U. S. Geological Survey, has located most of these water-bearing rocks in the Dakotas, and is now at work in Wyoming. When these rocks are fully located wells can be drilled into them and windmills used to pump up the water for irrigation. This will change the character of thousands of acres of at present desert land. This water mining is of more true importance to the western deserts than the mining of silver or gold.

At Outlook Farm.

This morning, July 15, the binder starts in on 14 acres of wheat while your humble servant takes the mower for a field of six acres more, down on the east line. We may get our seed and some hay, but didn't the agricultural papers tell us last Fall to beware of the fly, and to fit the ground well, so that the plant would be able to withstand his attacks? This piece we fitted in fine shape and seeded at time of sowing the wheat pretty thickly with Orchard grass, Timothy and Kentucky Blue grass. The redeeming point is that the Orchard grass shows up nicely and we expect a good sheep pasture there for several years. We no longer let the sheep run with the cows; don't think the cows have a fair show. These hot days the sheep come up from their field about 6 A. M. and stay in a darkened basement till 4 P. M., when they go back. If feed gets short I give grain in their hay racks, that have a tight bottom, with loose cover 14 inches up, to keep the lambs from soiling food.

As we were greening potatoes about 10 o'clock July 16, and there is a lot of it to do this year, a whirring sound, resembling the passage of a trolley car was heard, when just above our heads went a swarm of bees pushing for some hollow tree; a loss of $5 to some neighbor not up to the times in queen wing clipping. What might well be called agricultural murder, as I look at it, is planting potatoes in land so wet that they die in the vain endeavor to get to the sunlight. If the above is a fable the obvious moral would be, "drain it!" Finished the Red clover haying July 2, and are now in the second cutting of Alfalfa (better than the first), before some have secured their clover and Timothy. Long may it wave, and we hope that the Hope Farm man will in due time be converted. P. W. C.

Onondaga Co., N. Y.

R. N.-Y.—The Hope Farm man wishes he had some good Alfalfa soil.

Wood Acids in a Chimney.

H. Stewart answers the question how to "fix a chimney troubled with creosote" in issue of July 20. It reads well, but our experience proves to us that he has not given us a remedy. We use dry wood; creosote forms, not in the chimney, but in the pipe, running out through the joints, besmearing everything with the oily liquid. In another chimney in which coal is burned, creosote forms in the chimney. We shall build the chimneys over. How shall we build to prevent this trouble? The chimneys at present are built from the garret floor up. We thought possibly building the chimney down on to the second floor would help, shortening the distance between the stove and chimney. What is the trouble? We don't know. H. E. M.

Penn Yan, N. Y.

Come to Florida.

You can say to E. L., Leeds, N. D., page 501, that the place for him and his boys is in the South. He can make a good living here with less labor than any other place in the United States. Besides making his own bread and meat, at less cost, he can add a goodly amount of the luxuries in fruits and vegetables, and if he will attend the State Fair at Jacksonville about November 20 next he will see ample manifestations of this fact, and nowhere will he find nature more generous in either beauty or bounty than here, with neither the naked prairie nor the bleak winds of the North and East, nor the hot winds of the West. So far this Summer we have had the most comfortable climate of any State. He will not find the land deserted, but very low in price. S. H. G.

McIntosh, Fla.

SCRAPS.

IT is said that sparrows have become such a nuisance in Utah that Salt Lake County has this year paid a bounty of five cents per dozen on 42,000 sparrow eggs.

IT was an old Scotchman who silenced a chronic grumbler by saying: "The crow is always looking for carrion, and he finds it, while the humming-bird is always looking for something sweet, and he finds it."

THE Argentine government has become alarmed over the spread of foot-and- mouth disease, and has issued a decree prohibiting the importation of cattle and sheep from countries where this disease is known to exist, except under certain conditions. These are the most rigid official inspection, and a quarantine of 40 days after the animals are admitted into the country.

THE Health Officer of the Port of New York is about to make war on the Staten Island mosquitoes, which, for persistence and ferocity, are thought by many people to take the lead of their Jersey relatives. A careful examination of their breeding grounds in the vicinity of Quarantine Station will be made, and mosquitoes and their larvæ taken from these places and examined in the laboratory for the presence of germs of malaria. Kerosene will be the principal agent used in doctoring the breeding places.

OILED ROADS.—It is not generally known that crude petroleum is used in some sections for settling the dust on roads. In parts of California and in other States this plan has been followed with fair success. Kerr's Reports states that "Oil is applied at about 200 degrees temperature. The road is got in proper form and compact condition. It must be well settled and dried. A harrow is run over it until the surface is thoroughly pulverized for a slight depth. Then oil is drilled in and allowed to cool and settle. If it is traveled too quickly afterwards or too much oil is put in, or rainy weather and heavy traffic follows, ruin results. After an oiled road has become settled and is made under the best conditions it is preserved from washouts, dust, ruts and inequalities. It will become the best road that is made. There are several perfect oiled roads in California, they are clean, durable and the cost of repairing is much less than the cost of sprinkling to settle the dust."

DAIRY NOTES.

LATE HAYING.—On July 15 haying was in progress, with the outlook that the crop in our immediate locality (perhaps I might include this northern New York section) will be a very satisfactory growth. Every spear, however, that stands later than July 4 has been steadily losing value. We need a revolution in our notions of haying. When we discuss feeding we place especial stress on the concentrates; what kinds to feed, how much to feed, what to buy and how and when to buy, when the hay really is the most important item, that is; where hay constitutes the bulk of the coarse food. Every observing feeder has noticed how quickly the cows responded at the pail when a change was made, either by accident or design, from poor hay to good hay, and yet we go on year after year, waiting for the grass to get "some substance" before cutting. We ought not to need the chemist to help us out. Our flow of milk always keeps up until about June 20 to 25 in this latitude, provided always that food is in abundance. The shrinkage, if it comes, does so not from lack of "substance," but from lack of pounds.

LATE CUT GRASS.—At about the time this so-called "substance" begins to show up, if the milk flow is kept at anywhere near a normal one, the concentrates must be poured in, and quite liberally, too. We have not reached perfection yet on our farms, having to cut after July 15 to finish, but the extremely late wet Spring pushed everything away from us. We made a commencement June 23, and had six days in succession without a drop of rain, perfect hay weather. We secured 75 tons of as nice clover hay as a man could wish on one farm. It won't require 10 or 12 pounds of protein food next Winter to get milk with such hay, fed with corn silage. The protein question which we have so frequently alluded to as a burning dairy problem, may be partially solved at least by a more determined effort to cut grass and not hay. It is not done by simply writing or reading about it. With the increased corn acreage over former years, and the labor involved in caring for it during the month of June every year, and this year two weeks more must be added, before the cultivators can be laid aside, there are two avenues of escape; more labor or less corn! Corn we must have.

THE LABOR PROBLEM is not always solved so easily. If the dairy farmer who buys feed will stop with his load and figure with a one-cent pencil he will soon surprise himself by finding out that a ton of bran, costing $18, and feeding 30 cows 10 days, will hire a man in haying for 10 days, or a much better plan, hire him for nearly three weeks before haying, and get other work out of the way, permitting the regular farm labor to do this haying job, which always costs more per day than other farm labor. We are therefore prepared to get in from 40 to 50 tons of early-cut hay that may lack "substance," but cows fed upon it will not only make milk, but keep in condition as well. This 40 tons of hay will, to a most obstinate farmer, be considered worth $1 a ton more, I say $2, and it can be demonstrated any time with a good dairy cow in a warm barn in midwinter. This $18 investment in labor has returned us therefore a pretty good interest.

THINK OF THIS.—The man who forgets to put in the draw-bolt never starts his load, although it is a small piece of round iron weighing not over one pound. It would be false economy to spare the money to buy this bolt under the caption of frugality. Much false economy is practiced every day on the farm, and a lack of labor at a critical time may be truly classed as one form. Some days a man can earn $1.50 if we are only wise enough to have him ready on the right day. We have never been stingy with labor; in fact, it has been a friendly neighborly criticism that we hired twice the men necessary, and if one were looking for extra men he would no doubt find them at Cook's, and sure enough I have wondered where they all got their pay, but while it has been a hard rub the machine still runs. It is too late to cut hay in June this year; I only hope that every dairy farmer who reads this will begin a careful study of hay values, and study from now until next June on how to get the farm word dovetailed, and haying for northern latitudes out of the way before we celebrate our independence. One point more. The clover stands large enough as I write to cut a small swath upon the early-cut field, and with occasional showers will again cut a fine crop in September of one ton of cured fodder to the acre, and with abundant rains must exceed this amount. Do you know of anything better in the Fall months than second-growth clover and grasses, which are always worth more on a dairy farm to feed than for manure and mulch? The ordinary pasturing of meadows as practiced is no more or less than criminal farm practice, but the feeding of a fine second growth is a good business proposition, and we practice it.

GRAIN AND GRASS.—With the heavy growth of green forage crops I was quite determined not to feed any grain feeds this Summer, feeding not only liberally but lavishly of oats and peas, but the cows could not eat enough of it. We have therefore commenced with a grain ration of four pounds a day, two pounds middlings, one pound ground oats, and one pound dried brewers' grains. This small ration seemed to fill a demand. The milk shrinkage was checked and a slight gain recorded, not quite enough to pay for the extra food. Before feeding oats and peas Alfalfa and other clover was fed for two weeks. When the change was made a noticeable shrinkage took place. The oats and peas are so very rank that it is a physical impossibility for a cow to get dry matter enough out of them. It is dry matter she must have, provided it comes in the right form. The smaller growth of Alfalfa gave more dry matter and probably a little more protein. We shall soon change back from oats and peas to the second cutting of Alfalfa. We shall then be able to give results again. Enough dry matter in an easily digestible form we must have. The short pasture grasses are concentrated goodness. The oats and peas do not contain as much easily-digested dry matter, hence the animal demands the extra grain ration.

GERM LIFE is now in its most active growth. Every source of contamination needs attention. A fruitful medium is found in the low, wet, marshy places where cows are wont to stand these hot days. Stagnant water and animal excreta combine to make a most favorable breeding ground. Every handler of milk is familiar with the barnyard flavor, so called. The germ gets on to the flanks and udders. The udder appears clean, and the milker soon has germs and milk combined. The very rapid development causes trouble the next day. This is one of the germ flavors we find so difficult to destroy with lactic acid. It will still remain in cheese after curing as pronounced as when first developed in the curd. A double furrow through the center of a swampy place, and then one furrow plowed in the subsoil, will drain out these objectionable places, and do away with the trouble, and more, the cows will not drink this stagnant water, which is detrimental to health. I do not think the effect will be noticeable in the milk to such a degree as we have been wont to believe, the trouble being an external one, by open contact.

MILK TROUBLES.—The troubles with milk occasioned by food and water are rare. The troubles arising from germ contact after milking are not rare. I know of no way from a business standpoint to deal with these problems but to put milk at a temperature where the germs will not develop. It is gratifying to note the change of sentiment from Pasteurization instead of towards it—obtaining the same or more satisfactory results by refrigeration and sanitation. We might cite the great interest and spreading activity for farm separators in the creamery sections. I believe this system is well grounded upon a right principle, viz., that of reducing at once the volume of corruptible matter and placing the comparatively small amount of cream at once under low temperatures. It seems to me that the success must depend upon this idea as a foundation principle. The great milk-shipping interests of New York fully understand the necessity of getting the milk into cold water at once after milking. I have studied the care given to milk for New York shipment, and the attention given to milk peddled in our small villages with the firm conviction, backed up by drinking milk in New York and nearly every town in our State, that New Yorkers get better milk than the small country towns and cities, although transported from 100 to nearly 400 miles. Immediate refrigeration is responsible. I am earnestly looking forward to the time when milk for cheese making will receive the same treatment accorded to milk for long shipment. This may in part answer a question from a friend in the cheese section of western New York to give some rules for care of milk for cheese making. Briefly, after milking cool the milk as rapidly as possible to 60 degrees, and keep it there until the maker gets it. If this is done, the morning's milk may go unmixed, without cooling at all. H. E. COOK.

Crimson Clover Hay for Horses.

Is Crimson clover hay a safe feed for live stock, especially horses? When is the best time to cut and cure it? H. C. C. M.

A number of cases are reported from Delaware where horses were killed by eating Crimson clover hay. This hay was too ripe before it was cut. When over-ripe the long head of Crimson is covered with hard sharp hooks or spines. In the cases mentioned, large hard balls were found in the stomachs of the horses, and it is supposed that they were formed around these over-ripe clover heads. We have fed the hay to horses without injury, but would prefer to feed it to cows. We prefer to cut the clover just before the bloom is at its best. Crimson clover is not very satisfactory as a hay crop, for it must be cut at a time when we are pretty sure to have rain.

Send $1.25 for trial package, postage paid. Cans $12.50 and $6.50; packages $2.50. State number, age, condition, food of hogs. *Special advice free.* 25 years experience. "Hogology" pamphlet and testimonials free.
JOS. HAAS, V. S., Indianapolis, Ind.

NOTES ON DAIRY WORK.

In dairy work there are three very important things; brushes and plenty of clean white dish and wiping towels (not rags), scalding water and sal soda. The virtue contained in a pinch of sal soda cannot be estimated. It does not take very long to run hems in towels for dairy work. There is nothing better than flour and salt sacks; they are soft and pliable, also easy to wash. Have several dishcloths; don't use one for all the dairy work; one for separator, another for the butter utensils, and still another for milk pails.

Many farmers and dairymen have not the conveniences for ripening cream properly, and therefore cannot make a first-class article, and also lose much butter fat in the buttermilk. Keep the cream sweet and frequently stirred up to 24 hours before churning; put on the stove a boiler of water as early in the morning as possible. When hot take your washtub (or tubs if you have several cans) and place cream cans in, filling around with the hot water. We used shot-gun cans for cream, and three would sit in a tub. We had a stirrer made of sheet tin, just a little smaller around than the cans, with long rod for handle, this could remain in the cans and be lifted from one to the other when stirring. A dairy thermometer is used, and constant stirring until the cream reaches from 86 to 88 degrees, when the cans are taken from the water and placed where as even a temperature as possible could be maintained. Stir frequently, and by the next morning it will be thick and velvety. Do not fill the churn too full, as often this is done to hurry matters, when it is a loss in the long run. By salting butter in the churn no mottled butter will be had. When the butter is the size of wheat kernels stop churning, draw off buttermilk, put in pail of brine, which cuts the buttermilk out, and the butter does not have to be worked to get it out. Draw off and put on clean water until no milky water appears; drain and salt, working it in the churn until in large lumps, the principal working being done in the churn. When taken on to the worker or in bowl, only work or press enough to get the water out, and get in shape for printing or packing, as the case may be. Two-thirds of the creamery butter is overworked, the grain is spoiled and it is salvy, but it is *creamery butter*. We have bought creamery butter in New York, Colorado, Nebraska and Missouri, and from noted creameries, but we find good country butter made on creamery principles is usually the best. MRS. FRED. C. JOHNSON.

Missouri.

Milk Producers are Gaining.

The problem of producing milk at a loss, and being at the mercy of the dealers, is being very satisfactorily solved by organization and coöperation. One year ago last February a meeting was called and preliminary steps taken for building a plant for manufacturing and shipping our milk, and on April 1 all the milk but that from three or four small dairies was received at the farmers' plant, built by those jointly interested by taking stock amounting to $3,000. From then till now we have manufactured but one month's milk. With this exception it has been sold for periods of six months at a time at a fixed price each month, so that we are well satisfied, and better prices have been the result. Smyrna, four miles south, constructed a plant at the same time, making two in this section, upon the same plan as the one here, and with equally as good results.

Last Winter another was built and equipped at Poolville for making cheese, which has been very successful in producing a prime article selling for top prices; still another at Lebanon, a few miles west, which commenced manufacturing the milk June 1. Another plant was bought at Sherburne Four Corners, making five plants now owned and managed by ourselves within 18 months. Both Smyrna and Earlville receive about 22,000 pounds each daily. The success attending these plants is stirring other towns around to action, and several more are to be built during the coming Winter. One object gained is that the surplus milk in the market can be controlled and turned to our profit by making up at home. The flow of milk this season has been large, and continues good; pastures supplying a good amount of feed for stock. We are now in the midst of securing our hay crop, which is considerably larger than for two years past. Wheat and oats look well. Pea picking is also in progress and yielding well. W. F. JAQUITH.

Secretary F. S. M. P. A.

Air Blast Churns.

Readers are sending us circulars of churns which are said to operate by forcing a blast of air through the cream while the churning is going on. These churns vary in construction somewhat, but the principle of blowing air into the cream is about the same, and great things are claimed for it. One of these churns was brought to the Missouri Experiment Station for test recently, and after careful trial a report containing the following was printed:

The arrangement of air pipes does without doubt force air through the cream, especially at the start, but it is not at all certain that this aids in the churning. This might help to take out bad odors if the cream contained such. But the revolving dash in the center of a stationery vessel fails to agitate all parts alike, and requires a longer time than a box or barrel churn, as shown by the above test.

The machine does not meet the true scientific requirements of the best churning apparatus, and is exorbitant in price compared with small-size barrel churns, and cannot be recommended to the farmer. While it is no doubt true, as claimed by the inventor, that butter can be churned in this machine in from one to five minutes, this fact is no less true of any ordinary box or barrel churn under the same conditions. By raising the temperature of the cream high enough, butter may be produced in this short time by almost any churn. But what kind of butter results, when using temperatures of 75 degrees, or even 80 and 90 degrees? Anyone who knows the elements of dairying is acquainted with the fact that such high temperatures will produce butter of poor quality, soft and salvy, weak-bodied and without proper grain. This one mistake of too high temperature is one of the greatest causes to-day of poor quality in butter made on the farm.

Live Stock Notes.

I have been trying, during several years, to raise turkeys. As so many died I tried to find the cause by opening them; various organs might be affected, but the liver invariably was. In the younger ones there were yellowish ulcers, and in larger ones the bile was coagulated in the liver. This caused the conjecture that the food was the cause. The turkey hen, in her wild life, must depend on insects, seeds and some kinds of green stuff. So, last Summer I penned the mother with her brood into a yard where I gave her hemp seed, millet seed, etc. By this means I raised three out of 15; one tom weighed 16½ pounds at Thanksgiving. Of a later hatching of 10 only two lived. I find one-fifth of hatched turkeys good results in raising them. How does this compare with the experience of others?

PIGS.—Some one wrote in THE R. N.-Y. about wheat bran as a feed for pigs. I have a fine sow which I was told was too fat for breeding purposes. I gave her three quarts of bran twice each day last Winter, and in March a butcher wanted her to kill for pork, but she had her family in April. Six quarts of bran weigh four pounds, which can be bought for five cents; hence, a 250-pound sow can be kept on the price of one glass of beer each day! I have generally weighed sucking pigs during the first four weeks, and find that they weigh about eight pounds when two weeks old and 14 to 16 pounds when four weeks old. These results for a litter of eight or fewer pigs, the mother being one year old. A. C.

Nassau Co., N. Y.

Water Gas Tar for Flies.

Several readers have asked H. G. Manchester to tell more about the use of water-gas tar on cattle for killing flies.

In reply to E. S. K., the material we use for a fly repellant on cows is water-gas tar, which is a by-product obtained in purifying gas that is made from water and coal, with other substances. It is unlike ordinary coal tar in that it is thin and watery, and can easily be sprayed with an atomizer sprayer. Only a very slight spraying is necessary. We should be afraid to use coal tar, as it is thick, and a great absorbent of heat. A spot of it on the hand held in strong sunlight will burn the hand quite severely. It would be apt to injure skin of cows and take off the hair. We presume the material we use can be obtained wherever water gas is made. We buy it for not over $1 per barrel, but have to return the barrel. Coal tar might work satisfactorily if it were very much reduced with water and a little kerosene. We should never apply any of the fly repellants with a swab, as too thick a coating will be used. Atomizers do satisfactory work. H. G. M.

Death in the Silo.

In THE R. N.-Y., July 6, R. H. M., Lakeville, N. Y., asks about painting a silo on the inside, and the suggestion is offered to use gas tar put on hot. I cannot give the particulars about the painting of the inside of a silo, but I can give you the *result* of one, which was a very sad one indeed. Ballard Bros., of Niles, Mich., painted their silo (and with gas tar, I think); when they began to fill it one of the sons went into the silo to tread down the fodder, and was overcome with the foul air. A second son went to his assistance, and was likewise overcome. A third man went in hastily, put a rope around the second son, and he was drawn out and revived, but the first one overcome lost his life. While there may be ways of painting with gas tar, and no evil result from its use, yet knowing what I do I should hesitate about using it. H.

R. N.-Y.—We have had several reports of death in the silo, and followed one up closely to see what caused the trouble. The silo was airtight—being built of stone and brick. Several people went down into it in the morning before the filling for the day had begun. They were overcome, and it was found that carbonic acid gas had formed during the night. This being heavier than air sank to the bottom, and was strong enough to kill a man. In the average stave silo this foul gas would have drained out. A few moments' work with the cutter in delivering more silage into the silo would have stirred up the air and gas together, so that there would have been no danger. Also, if the silo doors had been open the gas would have passed away. We do not believe the fumes of the gas tar caused the trouble in the case mentioned. No one should go down deep into an airtight silo while it is being filled without making sure that the gas has drained out. Men have been killed by this gas by going down into deep wells.

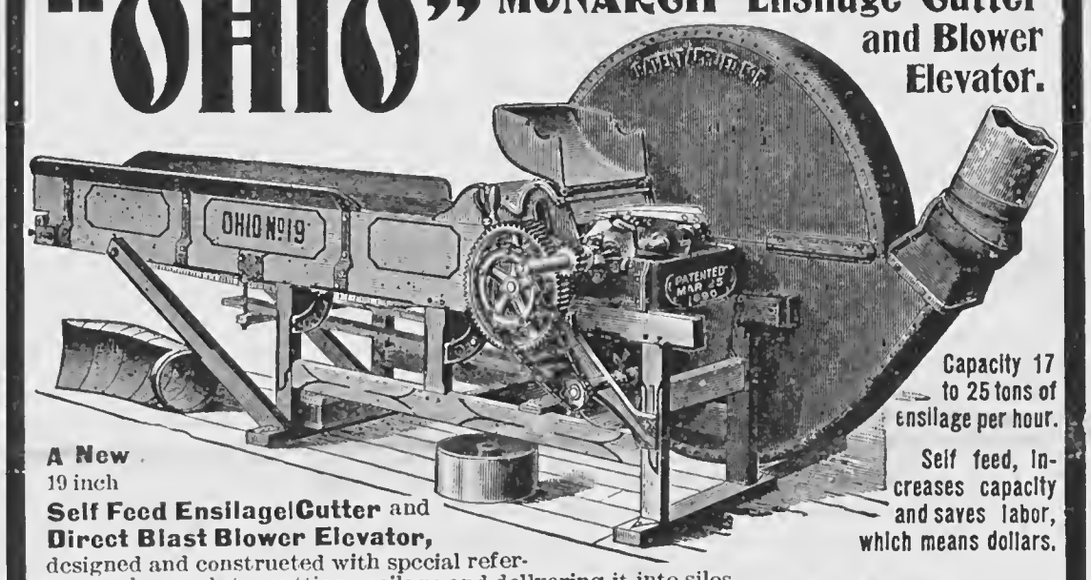
"OHIO" MONARCH Ensilage Cutter and Blower Elevator.



Capacity 17 to 25 tons of ensilage per hour.
Self feed, increases capacity and saves labor, which means dollars.
A New 19 inch Self Feed Ensilage Cutter and Direct Blast Blower Elevator, designed and constructed with special reference to heavy duty, cutting ensilage and delivering it into silos.
THE CUTTER is larger, stronger and has greater capacity than machines formerly made for this work. The knife shaft is heavier and the shaft bearings are longer and stronger. The knife cylinder is larger diameter, which better enables the cut ensilage to clear the cylinder.
BLOWER ELEVATOR. A large capacity, properly and substantially constructed steel fan case with agitator and conveyor at the inlet which make sure that the cut ensilage will get into it, and a swivel joint for the steel pipe at the outlet. The combined fly wheel and fan is mounted on the cylinder shaft and the Blower, while traveling at normal speed—600 revolutions—will elevate the ensilage into any ordinary silo as fast as it comes from the cutter and it is safe. Sizes No. 13, 16 and 18 Self Feed Cutters are also made with this kind of an elevator. Send at once for New Illustrated Catalogue. Manufactured by
THE SILVER MFG. CO., SALEM, OHIO, U. S. A.

QUICK CORN CUTTING
which saves the crop at its best, saves it from the frost, saves all the ears, saves time, saves labor and hence saves money.
THE SCIENTIFIC CORN HARVESTER
does all these things. Cuts any desired height. Safety shafts protect horse. Safety seats protect men. So low in price every farmer can afford to own one. Send for free catalogue, R

KEEP THE MONEY
that you intend to spend for a drill until you inquire into the merits of our
Improved Low-Down Pennsylvania Force Feed Fertilizer Grain Drill.
Sows all kinds of grain, corn and peas in any quantity per acre. Puts on any kind of phosphate, damp or dry, 60 to 700 lbs. per acre. Sows timothy, clover and other grass seeds either in front or behind hoes. Low down—easy to load. Easiest draft known to drills. Send for Farm Machinery, Engine, Saw Mill and Threshing Machinery Catalog—Free.
A. B. FARQUHAR CO., Ltd., York, Pa.

THE SPANGLER Low Down Grain and Fertilizer Drill

Is made with EITHER WOOD OR STEEL FRAME. Force feed as to grain, grass seed and fertilizer. Being low-down it is easy to fill, easy on the wheels and easy to handle. Sows all grain perfectly in any quantity desired. Stagger and lift lever. Raising hoes shuts off all feed. Land, grain, grass seed and fertilizer measures all tested and correct. Pin or spring hoes. The easiest draft known. Don't buy a grain drill of any kind until you know more about this one. General farm machinery catalog FREE.

A YEAR FROM THE START. FIG. 237.

THE BRIARCLIFF MANOR SCHOOL.

WHAT THE STUDENTS ARE DOING.

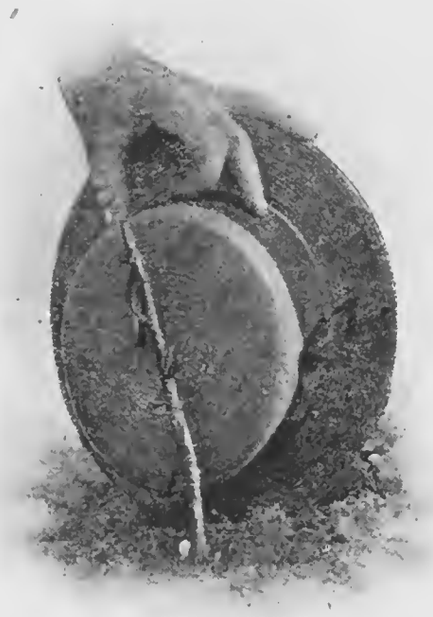
How It Differs from Other Institutions.

After phenomenal success in its unique method of teaching agriculture, the Briarcliff Manor School, situated in the central part of Westchester County, N. Y., is about to complete its first year of active work. It was founded as a private enterprise by a wealthy New Yorker, and thus far has more than come up to his expectations. There are now 27 students registered at the school, two of whom are women. The latter do practically the same work as the men, which consists of putting everything they learn to practical tests in the field. A remarkable fact in regard to the class of students at Briarcliff is that all but one are city bred, such cities as Boston, Philadelphia, Brooklyn, Pittsburg and New York being represented at the school. Students are also enrolled from the Hawaiian Islands, and Amsterdam, Holland, as well as from other distant countries. There are two general types of students at the school; those of considerable wealth who are studying agriculture with the idea of becoming competent in controlling agricultural land, and students who expect to make their livelihood from the practice of agriculture by becoming farm managers or experts in some particular line.

The school was designed with the idea of meeting the growing demand of city-bred people for rural life and rural pursuits, and of instilling into students a greater love for nature and the occupations of the more sparsely-settled country. In its methods of teaching, the school differs from Cornell and other agricultural colleges, by limiting its scope exclusively to the practical, and giving less advanced work in the sciences as well as other studies. The school endeavors to give the student the same experiences in its work that it would encounter in the outside world. During the Summer the instruction is devoted to field work, the instructors and students laboring together. The women students of necessity engage only in the lighter forms of labor, although they study the work quite as thoroughly as the men. The afternoon is spent in the class room where the fundamental sciences, such as chemistry and botany, are taught, and the practical work of the morning is discussed at length by instructors and students. Much time is also spent in the study of business methods as applied to commercial agriculture. This branch of study is recognized as one of prime importance, and one of the chief objects of the teaching is to impress the student with the need of accuracy and minute care in all his or her undertakings. It has become recognized that for success in agriculture, more than in any other commercial pursuit, great care must be taken with details.

In answer to a question as to the cause for the growing demand for women as farm managers and horticulturists, George T. Powell, the principal of the school, said: "Women are more painstaking in small details than the men, and in horticulture this is of prime importance. I think in the future horticulture will be a great field of employment for women." As an illustration of the kind of work accomplished by women, Mr. Powell pointed out work in hand cultivation in the field, which had been done by women students. The contrast between that and the work done by the men was quite marked, the former showing more painstaking effort. During the past year there has been a woman student at the school, from Honolulu. She has taken special work in flower culture with the idea of soon returning to her native country, where she intends to engage in the raising of flowers as a commercial enterprise.

Of the 65 acres making up the school grounds all are under close cultivation, the labor being done entirely by the students. The practice of tile drainage is followed quite extensively, and intensive methods are practiced in all the processes of cultivation. The soil is treated heavily with commercial fertilizers. These the students mix themselves, following formulas which have been found by experiment to be the best for the particular soil for which the fertilizer is intended. By this method the soil which had become poor from former neglect now furnishes astonishing-



THE START OF A PEACH TREE. FIG. 238.

ly large crops. A small peach orchard but two years from the bud had in many cases over 100 well-set peaches to each tree. These were nearly all removed, a large crop being anticipated for next year. Considerable space on the farm is devoted to experimental truck gardening, in which the students show great interest. About 50 varieties of potatoes are being grown in one plot, also a number of varieties of strawberries, and all the common garden vegetables are being experimented with in others.

That this educational venture will prove a success is assured; already a large enrollment of students for next year is promised. Such a school fills a need which no other institution has yet ventured to cope with. It is neither a charitable institution, nor an institution limited to a certain few, but a school where all youth interested in nature and rural pursuits may get what is wanted by going directly to the soil for knowledge. That a student should go to the Briarcliff School rather than to a State institution, where there is no tuition and consequently less expense, argues well for the success of the school.

In explanation of the pictures we would say that Fig. 238 is a peach tree as they were when planted out in May, 1900. They were cut down to from 16 to 20 inches tall. Fig. 237 shows the same trees 14 months later. They are between six and 7½ feet tall, and from four to five feet through. All of them set peaches, some of them carrying as many as 120 to 139 perfect fruits. As it is not intended to permit these to carry fruit until next year, they were thinned so that from one to three peaches are left on each tree to see if the variety is true to name. The soil is a gravelly knoll, and this part of the field was considered to be the poorest part of the farm. The whole farm has been let out on shares for several years, until no one would take it, as it was so run down. After planting the trees the land was prepared for cantaloupes and watermelons, which were grown successfully between the trees, the watermelons giving good returns. The cantaloupes were lost by blight in August, when within seven to 10 days of being ready to market. They were an exceptionally promising lot. No arrangements were made to combat the disease. We hope to pull this year's crop through all right. Crimson clover was sown in between the melons, which was left on the ground all last Winter as a cover crop, and plowed in this Spring. Varieties of peaches on trial are Studley, Niagara, Crawford's Late, Clifton Park, Fitzgerald and Champion.

Fig. 239 shows students scoring dairy cattle. In the Winter months practical work is taken in the cattle barns of Mr. Law, the students cleaning and milking the cows. In the picture a party is discussing the merits of two individual cows from a dairy standpoint, and scoring them for their points. The score cards are handed in to the professor in charge, who goes over the animals with the students, ascertaining their reasons for giving the various scores, and at the same time making criticisms.

Fig. 240 represents a party of students working in the greenhouse with violets and carnations, while Fig. 241 shows the dormitory building as it was when opened April, 1901. Since then the grounds surrounding the building have been graded and made ready for laying down as a lawn. A. F. B.

GRASS SEEDED WITHOUT GRAIN.

The "Clark" System of Grass Culture.

PART II.

How often does Mr. Clark work the ground?

From 15 to 25 times. As was stated last week, he uses a digging or lifting harrow, which tosses up and airs the soil instead of turning it over as a plow would do.

Why does he object to a plow?

Because he says it turns the soil over, leaving the top at the bottom. Subsequent tillage is at the surface. Thus the roots and seeds of weeds and foul grass are not disturbed; they are simply planted deeper. They live at the bottom of the furrow and grow again later, along with the new grass. When a Cutaway or spring-tooth is used this packing and burying cannot occur, for the soil is tossed or shaken up, and the sun and air destroy the weeds and poor grass. Many of these cannot be killed until the roots are cut off and exposed.

SCORING DAIRY CATTLE. FIG. 239.

Do you believe in this theory?

Yes, I feel quite sure that it is sound. I have tried preparing grass land with a smoothing harrow like the Acme. We used this tool again and again, until the upper surface was fine and smooth. It seemed like a perfect seed bed, yet, the first Spring after seeding, the field was well filled with weeds and coarse grass. I think the seeds and roots of this foul stuff were down below the working depth of the Acme, and thus were not destroyed. I feel sure that a Cutaway or spring-tooth would have dug them up and killed most of them.

But do not farmers obtain good grass with the ordinary methods?

Yes, I know of crops nearly equal to Mr. Clark's where the ground was merely plowed and harrowed once before seeding.

How do you account for that?

Such grass usually follows a crop like potatoes, berries or onions, where the most careful culture was given during the growing season. Thus the crop was kept free from weeds, and the soil thoroughly stirred. All this culture helped fit the soil for the grass. We must remember that Mr. Clark is talking chiefly about old meadows or stubble fields on which there are sure to be a great many weeds. He says that if we grow corn and potatoes for five years we would be obliged to work the soil six times at least each year. When we seed land down to grass for five years, and work it 25 times, we do much the same amount of cultivating that we would if the ground were to be in hoed crops. Under the Clark system the land is supposed to remain seeded down for years. Therefore he works it again and again with the Cutaway—going up and down, back and forth and around, until it has all been tossed and turned up to the air and sun. Mr. Clark also insists that the land must be level and well graded.

Do you consider this so important?

Yes, I feel sure that it pays to put reasonable time with a scraper in smoothing and filling up the holes and low places. They hold water, and in time of flood the sand and stones wash into them and kill out the grass. Mr. Clark's field is very smooth, and grades about like the cement floor in a stable, so that there is no heavy wash. On most of my own fields it would be impossible to grade the land in this way, but most mowing lands can be made smoother and more even with a little careful work. I firmly believe that most of us fail to work the grass seeding lands half as much as we should.

Did you say that Mr. Clark does not use stable manure on the grass?

He uses only chemical fertilizer.

Why?

He gives a dozen reasons for his practice. The manure, he says, brings weed seeds to the land. Weeds are more out of place in grass than in any other crop, because you can cultivate or hoe them out of the hill or drill, while there is no way of getting them out of grass without tearing it all up. Manure should go on a cultivated crop, and by its habit of growth and late season corn is best adapted to take care of the manure. A mulch on the grass is just what you do not want, and the fertility in manure is usually too slow to bring out the grass quickly. Soluble fertilizers scattered evenly over the grass will feed it well.

What fertilizer does Mr. Clark use?

This year he tells me that he used a mixture of one-third each nitrate of soda, muriate of potash and fine ground bone. This is a somewhat new combination for him, but in this wet season it gave good returns.

How much did he use?

He put on 800 pounds of the mixture per acre. This is a much heavier dressing than most of us use. I have heard farmers say that in a very wet season grass needs but little fertilizer, provided it has plenty of moisture. Mr. Clark says that if this wet season has demonstrated any one thing it is that grass needs something more than water—the things needful are sunshine and soluble plant food. I think some experiments with this Clark system have failed, because the heavy seeding gave twice as many grass plants to the acre, while no more fertilizer than usual was put on. I will try to speak of seeding next week.

H. W. C.

SPRAYING AND POISONED STOCK.—Regarding poisoning stock by spraying, I have sprayed trees for more than 50 different people, and have yet to learn of the first case of poisoning by the use of either insecticide or fungicide. Eight years ago, when I commenced to spray, people were very timid about the use of Paris-green, and refused to have trees sprayed which stood near the house, or in land where grass was to be cut. To dispel this fear I tied a four-months' calf under my apple trees within 10 minutes after spraying the trees with Paris-green, one pound to 150 gallons of water. I sprayed four times, and tied the calf under different trees each time, and I saw no bad effect whatever from so doing. People here have no more fear now of poisoning their stock from spraying their trees than they have of eating potatoes whose tops have been sprayed with Paris-green for destroying the Potato bug. S. R. W.

North Leominster, Mass.

NO RETURNS FROM SPRAYING POTATOES.

C. E. Chapman is right about spraying potatoes for blight. I only tried it one season, but have talked with careful men who have sprayed three seasons and then admitted that they did not know positively that it did any good. They were up-to-date, and experiment stations said spray, so they sprayed. I have seen a 10-acre field of potatoes sprayed six times, all except eight rows, first when plants were six inches high, and kept "whitewashed" till blight struck them about August 12. The eight rows unsprayed were just as good, yielded as well, and there was not a particle of gain from all the labor and expense for material. I don't say that no one ever got good results, but there are conditions affecting blight that no man understands. Usually blight does not attack a crop until about the time blossoms fall, and ordinarily if blight is prevalent, it does attack at about that stage of growth, whether vines have been sprayed or not.

AT WORK IN THE GREENHOUSE. Fig. 240.

The average farmer who attempts to bother with Bordeaux when haying (and this year hoeing, too) is driving will soon get enough of it. I say, prepare your ground thoroughly, and fertilize abundantly, if chemicals are used, not less than a ton per acre. Use the best of seed, plant at the right time, and rush them from start to finish. Don't let bugs or weeds get the advantage, and you won't be beaten by your neighbor because he sprays and you don't.

Massachusetts. E. D. GIBSON.

I have not yet commenced spraying potatoes for the reason that, growing for seed purposes exclusively, I plant very late (this season July 9), believing I can thus produce seed of higher vitality and vigor. I shall continue spraying for the reason that I dare not do otherwise, but of its utility I am not fully satisfied. I have more faith in the disease-resisting qualities of certain young vigorous varieties, and thus far am discarding varieties at the first hint of weakness. I am dreading the time when Carman No. 3 and Sir Walter fail me, and will give next year $100 for one bushel of a new variety that excels the former. Last season my Uncle Sam blighted in spite of spraying, while none of my other varieties seem

DORMITORY AT THE BRIARCLIFF SCHOOL. Fig. 241.

to need it. During period of active growth I think potatoes should be sprayed at least once weekly. Commence as soon as necessary to use poison for the bugs. E. A. HILL.

Greene Co., N. Y.

About here the blight or rust does not usually strike our potatoes until somewhere from August 10 to 20. I have not sprayed yet, but expect to a little later. Very few farmers use Bordeaux Mixture. I have used it for two years, and am fully convinced that it pays to do so. As the Bordeaux is a preventive rather than a cure, one does not always hit right, but one year with another it certainly pays. Last year the potatoes through this section were terribly affected with blight. I used the following mixture, and got a good crop: Four pounds lime, four pounds copper sulphate and one pound Paris-green to a barrel of water. On one piece where we made only one application of Bordeaux we worked from each outside toward the center. As we ran out of the mixture before the center was reached there was a narrow strip left. This was indeed an object lesson, the tops being completely dead two weeks or more before the others. It happened that the dividing line was near the center of the Clark's No. 1. There was so much difference in yield that I measured the product and computed for an acre. This showed a difference of 79.4 bushels per acre in favor of the sprayed plot.

Colebrook, N. H. B. A. C.

FARMING IN A WET SEASON.

Early and constant rain upset my plans, and I find all of my calculations transposed. Corn was planted before the long May rain, but did not come up until after the rain ceased. It looked so backward and yellow that I feared the silo would not be filled this Fall; but when the hot weather came on, and we gave the ground good tillage, how it did turn dark and grow! It is uneven, but I think will be ready for the silo by the middle of September.

Some of my mistakes look so large to me that I hope I shall not make them again, but of course shall make others. My worst one the past season was in not seeding all bare land to rye last Fall. Two of my best fields have no crop this season to bring income as a result of such failure. Had I seeded to rye I could have harvested 13 acres of good grain. I have one field plowed, and am seeding to Canada peas and oats to-day (July 29). I am asked whether I shall get a crop. I don't know. They may be too late to harvest, even as a fodder crop, but at 95 cents per bushel for Canada peas I think they will pay to plow under. The other field had millet after hay last season, and I put manure on it, expecting to plow and plant to late cabbage, but I believed in the advice of the Hope Farm man and took care of what we had planted rather than neglecting them and putting in more, so that manure is now forcing a rank growth of ragweeds and other weeds and grass. I shall plow this under within a few days and sow to rye. This, I think, should grow good potatoes next year. Through all of this the cows have kept right on doing their duty. Give me the cow, silo and soiling; less acres of planted crops, better manured and best of tillage. I think I shall make no mistake in this. How much better to take nature's workings, good-naturedly adapting ourselves to conditions!

Ontario Co., N. Y. C. R. WHITE.

EXPERIENCE WITH "CLARK" GRASS.

NOT A FAIR SHOW.—Last year I had about three acres of good ground that was seeded to oats in September, 1900. I looked the piece over, and came to the conclusion that there was not much of a seeding, so I went around one-half of the piece, intending to plow the whole, but it was dry and hard, and the ground plowed up in lumps, so that I did not finish. This was in August; in September I undertook to harrow the ground, but with all of the machinery I had I could not get the lumps pulverized, and had to let the piece go until the first week in October, after a rain; then I finished fitting the piece, and sowed 12 quarts of Timothy seed to acre, and 10 quarts clover, eight quarts Red and two quarts Alsike. I finished cutting the crop last week. I got three loads on the piece I left and did not plow, and one load on the part sown after the Clark plan, so you see the old way is ahead. The Clark grass seems to be thick on the ground, and if nothing happens will cut a big crop another year.

Cortland Co., N. Y. HOMER J. BROWN.

R. N.-Y.—This was hardly a fair test for the "Clark" system. The seed was put in too late and the ground was nowhere near as fine as Mr. Clark makes it. We feel sure that grass will make a better showing next year.

SUCCESS IN PENNSYLVANIA.—The grass seed which I sowed last Fall by the Clark method turned out well. It stood as thick on the ground on most of the field as a person could wish. It was stalk ground plowed down in the Spring with Crimson clover; worked it through the season to keep down the weeds. After harvest I worked it again, and drilled some good fertilizer on the piece; then sowed 12 quarts Timothy seed to acre with Cyclone seeder; covered with the weeder by going across drill marks and then rolling it down. Most of the seed came up in the drill marks where the fertilizer was put. I cut three big two-horse loads to acre, excepting along a piece of woodland. It was cut after oats and was commencing to get ripe. This is certainly the way to get fine hay. All through the season it was a dark green color and looked like wheat at a little distance. Several heavy rains put it down flat, but it was mostly standing up when cut. Part of the field on the slope was badly washed by rains before it had taken root, and some at bottom of hill was covered with mud. Where a farmer has a level field that does not wash I think this is an ideal way to get grass. Where a hillside is liable to wash in Winter I think by sowing oats it would hold the ground until Spring. I may try some that way this Fall. J. H. T.

Avondale, Pa.

WHEN TO FERTILIZE ASPARAGUS.

The Feeding of Deep-Rooting Plants.

On page 502 I find an inquiry from H. C. C. M. as to fertilizing asparagus in Fall, which, with the reply there printed, moves me to make some remarks. I grow asparagus in a limited way—about three-quarters of an acre—and the question of proper time to fertilize has been given considerable attention, theoretically and practically. I had supposed that plant food taken through the roots had to undergo a change—a sort of digestive or assimilative process in the leaves—before it could be utilized by the plant in making tissue. If I am correct in this, it follows that fertilizer applied to asparagus in Spring can assist growth but little so long as the young shoots are kept closely cut, as the plant carries no foliage by which to elaborate the tissue from the crude food. I think all plants other than annuals store up in roots or bulbs a supply of nourishment for producing growth the following Spring, and the first growth is made by the expenditure of this stored-up food already prepared the previous season. Watching the growth of shrubs and trees in Spring I have noticed how rapidly the young shoots push at first, but soon they come to a standstill, and after a short rest resume growth. I suppose the first growth is from stored-up food, then a pause until the new leaves prepare more food, when growth begins again. Asparagus has very large heavy roots, which hold stored, ready prepared, much material for growth. It is at the expense of this material that the asparagus harvest is produced. Reasoning thus I have applied in Spring a fertilizer containing potash and phosphoric acid, with some nitrogen; and when the cutting season is over I give a good dressing of nitrate of soda. Once in three or four years a dressing of stable manure in Autumn over the rows is used to keep up the supply of humus, and to keep the soil light. Such has been my practice, and my reasons for it, and my success has been such that no better "grass" goes into market.

In your remarks replying to H. C. C. M., you speak of asparagus being a deep-rooting plant and time being needed to get the fertilizer down to the roots. Did it ever occur to you that the great roots away down in the earth gather little if any food, but act as storehouses and coiduits for food gathered by the little feeding rootlets with their mouths near the surface? Such I think is the fact. My experience has led me to the conclusion that no plants gather much food in common soils at a depth of more than 12 inches from the surface. I have dug holes two or more feet deep, filling the bottoms with manure and compost, and set in them grapevines, and within 10 feet of them set other vines, only making a hole large enough to put the roots in, and one did no better than the other. I once plowed in a heavy dressing of manure, 10 inches or more deep, and never could see much benefit from it until it was plowed up again two or three years after. The roots of trees run sometimes many feet into the ground, but I do not think they go there for food; they go for anchorage and water. When building my present dwelling house I had occasion to excavate a dry gravelly knoll to a depth of six to seven feet. Roots of elm trees growing near spread near the surface with their fine rootlets. Occasionally I found a branch starting from the underside of a larger root and going perpendicularly downward. Those roots were straight stems, almost without branches. At one place, 70 feet from the nearest tree, I traced such a root six feet down, and at that point it was about five-eighths inch in diameter, not much less than where it left the horizontal root near surface. When cut at six feet depth water oozed from the part left, but the time was dry, and surface roots showed no such moisture. Is it not a fair inference that the function of that root was to get drink? Several years since our farmers' club assigned subjects to the different members for investigation. To one man was given the question at what depth to place fertilizer to grow sugar beets with best results. It was placed at varying depths from surface to eight or 10 inches down, and the nearer the surface the better the result. By surface I do not mean *on* the surface, but worked into it. From all my experience and observation I have concluded that plants feed only where air circulates and moisture is present, and that the supposition that deep rooting plants bring fertility to the surface from the subsoil is erroneous. Manure, to be of value to the plant, should be near the surface. M. MORSE.

Massachusetts.

R. N.-Y.—The experience of a practical man is worth any amount of theory, but it should be borne in mind that stable manure requires an appreciable interval of contact with the soil before the plant food is rendered available. If applied when cutting ceases, and prolonged dry weather should ensue, the chances are that much valuable time would be lost. While Mr. Morse's contention that plants feed chiefly by means of their surface rootlets is undoubtedly correct, the fact remains that asparagus is comparatively a deep-rooting plant, not sending its feeding roots as near the surface as most others. If soluble chemicals like nitrate of soda are used it is good judgment to make the application at the beginning of active growth, when the cutting season closes. As the cutting season for asparagus has been practically shortened one-half by the advent of the rust the matter becomes of less importance than heretofore. New Jersey growers of long experience prefer to haul their manure on the beds when the ground is frozen, as the work is easier and the beds less cut up.

THE FARMERS' MUTUAL TELEPHONE.

How to Start in Business.

A RURAL SYSTEM.—We are just completing a mutual telephone system in our town and the surrounding country for five miles out. I often receive letters of inquiry as to the best method of procedure. Farmers are more self-helping than formerly. They take contracts for bridge and pike construction and other work. In telephone construction they are bothered by technicalities of legal procedure, and forms and regulations. In many places, however, they are learning to build telephone systems, and are saving a heavy amount (near 40 per cent) on their money. At the rate systems are being installed it will not be 10 years before almost every enterprising community will be using the 'phone. We have figured it out this way: If stockholders will associate together and take $20 stock each, buy their own instrument and put up and maintain the plant at cost, they will have a permanent investment of $30 or $40, which will bring them a free 'phone service. We find that our system will cost us about $100 a mile besides the cost of the instruments. In the rural lines we shall have about four to the mile, and the thicker-settled town subscribers will average it to about five to the mile of line. The line is put up of White cedar poles with a good switchboard, and the system will be as perfect as the Bell lines. Our 'phones cost $13 each and it is expected that a farmer can talk with ease to Chicago or Cincinnati.

PAYING EXPENSES.—Our sources of income are three. First, we shall charge toll of 10 cents for everyone using the line if not a subscriber, even if one's nearest neighbor. It is fair, since he is out nothing for the line or instrument. One subscriber objected, and said that if his neighbor should want to call the doctor he would go clear to town for him if necessary. We said that that was no reason why the man should not pay 10 cents for a service worth perhaps $1, and if you are so generous you can pay the 10 cents for him, or let the 'phone stand and go to town for him. We are not supposed to be interested in the friend; let him pay for the service. Second, we receive a rebate of 25 per cent on all matter going out from our switchboard to outside points over the New 'Phone Company's lines. Third, we shall charge a rent of $12 a year on all 'phones furnished to those not subscribers, and $6 a year for all non-subscribers who buy their own instruments. These three sources of income will, we think, pay all expenses and let the stockholder have a free service for his investment.

HOW TO START.—A few of us had seen something of the work elsewhere; met several times and prepared articles of association. These must contain certain conditions described in "An act concerning the organization and perpetuity of voluntary associations," which will be sent by the Secretary of State on application. These articles of association should be written on good paper, large enough to hold the names of all stockholders. A copy should be kept, since the original will be filed at the office of the Secretary of State. They must give the name of the corporation, the amount of capital stock of the same, the number of shares into which it is divided and the amount of each share, the object of the association and its plan of work, the name and address and amount of stock of each stockholder, the principal place of business, the term of life, the description of the corporate seal, the manner of election of directors and their number, together with the names of those who will manage its affairs the first year. After writing out the above articles we secured subscribers up to $1,000, and then called a stockholders' meeting and organized and proceeded to elect five directors. We also designated what lines should be built. The directors must organize within 10 days and elect a president, who may be superintendent, and a secretary and treasurer; both offices may be filled by one man. As soon as our stockholders' meeting adjourned we had the said articles acknowledged by seven stockholders before a notary, and forwarded them at once to the Secretary of State for filing.

WHY ORGANIZE.—I would not advise organization by association merely, because the advantages of incorporating are considerable. First, it gives business method and recognition and credit. Second, it relieves one of any liability for damages or debts which shall exceed twice the amount of stock. That is, if I have $20 stock I cannot be hurt more than $40 at most. We had an example in this State where farmers associated and each put up his native poles and his own wire. After a while the poles became sap-rotten and the wire came down, and the system was worthless. A wire got across the highway and jerked off a buggy top, causing a runaway. This was followed by a suit which resulted in $800 damage. Not being incorporated, each one was liable for the whole damage, with no relief. Had they been incorporated the line would not have been everybody's business, and would have been valuable and safe, and the liabilities would have been small.

The system cost a little more than we estimated, but we also used a little better material. We paid $150 for a 100-drop switchboard with 40 drops installed, when we expected at first to secure one much cheaper. E. H. COLLINS.

Central Indiana.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

The Arctic Apple.

W. F. C., Turner, Me.—Can you give me a correct description of the Arctic apple?

ANS.—The Arctic apple is of medium size, flat, dark or bright red, of fair flavor when fully ripe and keeps until late Winter in the Northern States with proper care. It is such a newly-introduced variety that little is known of it outside a few places in New York and the New England States. H. E. V. D.

Pruning Questions.

G. A. B., Germantown, Pa.—1. Is it ever proper to prune or cut back grafts? In March, 1900, I grafted a fine new pear on an Anjou. This tree is 11 years old, about 14 feet high, and 3½ inches diameter; a remarkably strong tree, but has never borne but once, and then had only two pears on it. The graft, now 16 months old, is about the thickness of a lead pencil, but is four feet 10 inches long. Should it be cut back? 2. I have two cherry trees 10 years old standing 18 feet apart. The Bigarreau is a rank grower, with leaves so dense as to exclude both sun and air. My gardener pruned it in March, cutting away one-third of the inner limbs, but it failed to bear. Entirely new growth, suckering from the limbs, has in several instances attained a length of 30 inches. Four grafts on this tree last March all grew nicely. The California cherry is a much more feeble grower, and it was loaded with cherries, but of four grafts on it, not one grew. What would you advise me to do with the Bigarreau? Would it not be advisable severely to prune the California, and if so, when?

ANS.—1. Yes, cut back this or any other graft when it does not grow properly. A graft is the same as any other part of a tree, and should be treated accordingly. It is a good plan to pinch back grafts the same year they are set, if they grow too tall and spindling, thus causing them to branch out and take better forms. 2. Cherry trees rarely need much pruning. They usually bear when they attain proper age, if conditions are favorable, and I would think these trees ought to bear at 10 years old. I would be patient with the strong growing one and enrich the other. Then if they do not bear properly I would graft the former and regraft the other.

H. E. V. D.

An Orchard on Long Island.

A. R., Brooklyn, N. Y.—Early last December I had planted at St. James, L. I., an orchard of Fall Pippin, Maiden Blush, Baldwin, Ben Davis, Bottle Greening and Tompkins King apples; Bartlett, Kieffer and Seckel pears; crab apples; Crawford Late, Elberta and Champion peaches; raspberries, blackberries, currants, Fay and Cherry, and gooseberries, Red Jacket and Chautauqua—about 1,750 in all. The soil is a sandy loam with a gravel subsoil. The trees were bought from a first-class house in Rochester, but they have not done at all well up to the present, owing to disappointment in not being able to get anyone to work in the Spring. The trees were not cut back at all. Should I leave them until next Spring, or would it do any damage to cut them back the first week of August, when I shall be able to see to it myself? They have not had any fertilizer, but I have had the ground plowed and am going to sow Crimson clover between the rows to plow in next May. We have had Peach curl, leaf rust on the apple leaves, and the buds on the cherries after opening into leaf seemed to turn brown and shrivel up. Should I sow the clover right up to the trees, or keep it a few feet away?

ANS.—It is probable that the varieties planted will do quite well on Long Island. The matters of cultivation, pruning, etc., are essential to success, and it is useless to continue keeping the farm with an idea of profit under any other conditions than the best of care will provide. In my opinion, August is a little late for pruning, but if it is not done too severely no damage is likely to result. In all probability a good fertilizer would benefit the trees greatly, and it would be well to apply it with the Crimson clover seed this Summer. It will do no harm to sow it close to the trees, if it is plowed down next Spring

H. E. V. D.

Lime or Wood Ashes for Strawberries.

What has been your experience with lime or wood ashes used on strawberries? Experiments seem to show that where the soil is quite sour, lime is helpful, but that when the soil is not sour little benefit is observed.

ANS.—I have applied wood ashes at the rate of two tons to the acre upon strawberries with the very best of results. My soil is a gravelly loam upon a clay subsoil, and in some portions of the farm what would be known as hardpan. There is more or less of acidity in this soil. I am satisfied that the lime in the ashes has particular value, and I intend to apply lime direct to the soil. I have found it of late almost impossible to plant cherry trees with any certainty of their growing beyond one year. Such varieties as Robert's Red Heart and the Elkhorn are among the most valuable of all our cherries, as also the Black Tartarian. It has been with great difficulty that I can get any of these varieties to grow of late years. I am going to plant again of all of these kinds, but shall first give a liberal application of lime before planting the trees. I shall then use wood ashes as the one form of potash to be applied, sow Crimson clover to give such nitrogen to the soil as will be needed, and get the soil in a good mechanical condition, as well as increase its ability to hold moisture. I have been exceedingly well satisfied with the effect of wood ashes, not only upon strawberries, but upon all kinds of tree fruits. There has not only been a fine growth of foliage, but the fruit has been of excellent quality, as the result of both lime and potash contained in the ashes. I believe that potash in wood ashes is in the best possible form for fruit, and where the ashes can be purchased at a reasonable price my own advice would be to use them freely. I believe there is value in wood ashes beyond the mere commercial value of the potash they contain. Good Canada hardwood ashes contain about 30 per cent of lime in the form of carbonate of lime. Soils are far more acid than they are supposed to be, and moderate applications of lime made annually are of greater value than heavy applications made once in three or four years.

GEO. T. POWELL.

What to Do With a Small Farm.

R. B. C., Easthampton, Mass.—Will you tell me what would be the best crops to raise on a 40-acre farm in New Hampshire? I am told that there is no stone on the place, and the farm is level. It is 1½ mile from the railway station. If I could obtain a market for my produce in Boston, would it be wise for me to raise small fruits and vegetables, and ship them to the city? Also, do you think that poultry for eggs and broilers would pay? I am employed in a factory at present, but have worked some on farms.

ANS.—It would be worse than guessing to try to answer these questions. Neither of us has seen the farm. We do not know what the soil is, how the roads are, how much cleared land there is, or anything definite about it. In our experience the best crops for an inexperienced man to start with are grass, corn and potatoes. All these require great care and skill, but the beginner can do better with them than with most other crops, and can thus learn something about working the soil. We would not, of course, plow up any good grass land to begin with. We would start a good flock of poultry at once, and increase it to reasonable size as fast as we could afford comfortable houses and provide food. We have found that currants pay about as well as any small fruit for the beginner. They can usually be sold in bulk, and there is less rush about picking and shipping than there is with other small fruits. We would advise you to go slow with most fruits and vegetables. Great skill is required to raise them properly, and you will need some years of hard work before you can make them pay. You will have to be satisfied with small returns until you learn how to handle your farm.

Clipping the Alfalfa.

J. F. L., Clifford, N. Y.—I sowed a small piece of ground to Alfalfa about May 20. The weeds have got the start of the Alfalfa. Will it answer to put the mowing machine on and cut as high from the ground as five or six inches, and rake the weeds and Alfalfa off? I think it would be good for the cows.

ANS.—Yes, we would by all means clip off the weeds. This is usually done by good farmers. Sometimes it is necessary to do it twice the first year. It pays—giving the Alfalfa a show and keeping down the weeds. It sometimes pays to clip off the young clover in the same way.

Spraying the Resin-Lime Mixture.

J. V. B., East Setauket, N. Y.—Last year Hope Farm Notes described means of killing the worms on cabbages. Was the resin-lime mixture used? Was there any trouble in spraying it? I used Paris-green dry on mine, but it did no good, as my crop was a total failure.

ANS.—This resin-lime mixture is thick and sticky—hard to force through the ordinary nozzle. A strong force pump is required. The cheaper class of pumps would clog and probably prove useless. Spraying this mixture is hard work. For the benefit of those who have not kept back issues of THE R. N.-Y. we repeat the formula: Five pounds of pulverized resin, one pound of concentrated lye, one pint of fish oil, five gallons of water. The oil is used to soften or dissolve the resin. Boil the oil, resin and water in an iron kettle. When the resin is softened add the lye—first dissolving it in water. Stir this well and then add four gallons more of hot water. Boil all this until you have a clear, amber-colored liquid which unites with cold water. This makes a "liquid soap" which when put with the Paris-green and water will make it stick well to leaf and stem. When you add the potash and water you must let the kettle cool slightly. If this is not done the whole mass may boil over and the oil and resin will take fire.

Disk Harrows; Brome Grass.

J. M., Grantsville, Md.—Can the disk or Cutaway harrows be used successfully on stony or rocky ground? Do you recommend the new grass (Bromus inermis) for culture in the East in preference to Timothy or other well-known grasses?

ANS.—In our experience such harrows are not at their best on soil covered with flat stones or with large rocks. The disks are chipped and broken, and cannot toss and throw the soil as they should. Where the stones are small and round these tools do better. The best harrow for stony fields is the spring-tooth. We advise only an experiment with Bromus inermis or Awnless brome grass. It appears to give good satisfaction on the dry plains of the West—being reported superior to Timothy in Nebraska or Dakota. For the more humid climate of the Eastern States we prefer our common grasses and corn.

Yields of Asparagus and Rhubarb.

W. W. W., Tyrone, Pa.—How many pounds ought an asparagus bed to yield to the acre under the highest culture? How much does dark-forced rhubarb yield compared with that grown naturally?

ANS.—The following answer to first query by a most experienced grower, Edwin Beekman, will be found of interest:

"My old bed of Conover Colossal at seven and eight years (the prime condition) cut 3,000 2½-pound bunches per acre. At that time rust was unknown. I am informed that the Palmetto, before the advent of rust, in its prime (six to nine years) would cut 2,000 bunches, 2½ pounds, per acre, but of course this would be mostly all No. 1, only a small percentage of cull shoots. Since the rust it takes a good bed of Palmetto to cut 1,000 bunches in a season, and very few here this year cut that many."

We have not been able to get authoritative yields of forced rhubarb as compared with field plants, but our own experience, extending over several seasons, implies that nearly the same weight may be cut from forced as outdoor plants, though the roots are practically destroyed in the process.

PAINT SAVES MONEY. It protects your property and improves its appearance. Buildings kept well painted last longer; without protection from weather and sun they will soon decay.

In painting, labor is two thirds of the cost. It is a waste of money to put anything but the best paint on your buildings.

The best paint is Pure White Lead (see list of brands which are genuine) and Pure Linseed Oil. This will protect your buildings longer and better than any other known paint material.

For any color or shade required, use NATIONAL LEAD COMPANY'S Pure White Lead Tinting Colors. Pamphlet sent free upon application.

National Lead Co., 100 William Street, New York.

The New Horticulture

BY H. M. STRINGFELLOW.

We do not hesitate to say that this is one of the most interesting books on horticulture that ever was printed. Most reading farmers have heard of the now famous "Stringfellow Method" of planting trees, but few understand clearly what it is. This book tells the whole story in clear-cut, forcible style, which all can understand. Not only is the theory of close root-pruning carefully explained, but the general principles of gardening and fruit-growing are discussed. Mr. Stringfellow is a practical gardener, and he gives his own experience. We commend the book to all without reserve. New Edition, paper covers, 50 cents.

THE RURAL NEW-YORKER, New York.

DRILLING FERTILIZER WITH WHEAT.

Has it been your experience that drilling fertilizers in with the seed has had any injurious effect on grain? We have reports that where superphosphates are used in this way, especially in very dry weather, the grain fails to sprout well.

With the ordinary amount (200 to 300 pounds per acre) of commercial fertilizers added for wheat, there is very little danger due to the application of the fertilizer in the drill at time of seeding. Wheat fertilizers do not usually contain large percentages of potash or other salts, the substances that are commonly injurious to young grain. In our own practice, we use the drill in applying fertilizers, not only for wheat, but for other drilled crops, as oats and peas, millets, Kaffir corn, cow peas, etc., and use very considerably larger amounts of superphosphate and potash than are applied by the average farmer, and have yet to find any serious difficulty. Where the purpose is to bring up poor land, and heavier applications are made, then I should recommend that part of the fertilizer be applied broadcast.

N. J. Exp. Station. E. B. VOORHEES.

I have always had a theory that a heavy application of fertilizer on grain would be better sown broadcast and harrowed in, but last Fall I had my faith in that theory shaken. With an old drill I undertook to drill about 400 pounds to the acre with the seed, but two of the spouts ran about three times as much fertilizer as they should, and I fully expected it to injure the seed, but as we could not stop it we went on that way. When the wheat came up those drills immediately grew away ahead of the others, and still showed a great advantage when the wheat started in the Spring. I think they probably lost their lead later, as the neighboring rows discovered the storehouse; at least I noticed no difference after the wheat had reached a good size. With a cheap acid phosphate I should feel shy of using it heavily in a drill, but I cannot say anything positively about it from experience, as I have never used any such.

THOMAS R. HUNT.

Hunterdon Co., N. J.

FLAX STRAW FOR CATTLE.

One of our readers in Illinois says that he sowed flaxseed with his oats this year and, on account of the dry weather, the flax did better than the oats, so that the stand was about half and half. He cut this combination and made hay of it, and is feeding it out to his cows. The increase in milk is satisfactory, but some of his neighbors say that the flax will cause abortion in the cows. Is it not safe to feed flax hay or straw in this way, or is it likely to cause trouble with the cows?

The question as to results will hinge on the proportions of the flax and straw, and on the amount of the same fed daily. Also on the degree of the advancement in ripeness when the crop was cut. If the quantity of flaxseed fed is excessive it will eventually cloy the appetites of the cows and may tend to produce butter overmuch oily. If the proportion of the flax straw fed is large, and if, moreover, it was pretty ripe when cut, then there may be some danger that the fiber of the same will impact in the stomach and cause trouble. If the crop was cut a little underripe, and if fed in moderation, the presence of the flax should be altogether helpful. I see no reason why feeding flax should cause abortion any further than through some derangement of the system brought about by feeding it excessively or improperly.

[Prof.] THOS. SHAW.

St. Anthony Park, Minn.

It is true that the opinion that flaxseed will produce abortion in cows or other farm stock is quite prevalent. Some cases of this kind have been attributed to the use of flax straw containing only a small amount of the seed. It is probable, however, that much of this fear is not well grounded. A feeding experiment was conducted at this Station to determine first, the relative nutritive value of flaxseed and oil meal, and second, the effect of using a liberal allowance of ground flaxseed. Ten cows were used in the experiment. Five of them were fed ground flaxseed in addition to corn and corn fodder. They were put on to the ration gradually, and the flaxseed increased until at the end of about 60 days they were getting eight pounds per head daily. No injurious results whatever could be attributed to the flaxseed. The flaxseed was ground. Whether or not the results would be the same on unground flaxseed I cannot say. It is not likely that digestion would be as complete with the unground seed. I know of no data concerning the use of the kind of product mentioned in the inquiry, but judging from the results of the experiment referred to, I would not anticipate any injury provided it is fed in moderate quantities, and cows are put on to it very gradually. C. F. CURTISS.

Iowa Exp. Station.

EVERYBODY'S GARDEN.

THINGS TO REMEMBER.—It requires as much soil fertility to grow a worse than useless crop of weeds as it does to grow a useful crop of vegetables. The weeds that are growing here and there, either in the crops or elsewhere, are robbers, simply robbing the soil, and heaping up wrath for the gardener in the future. It is far easier to destroy one weed this year than a thousand of its offspring next year.

COVER CROPS.—As in most localities, but few crops will be put in during August, it is a convenient time to look ahead to the work of the Winter and early Spring. Of necessity much of the ground will not carry any crop of vegetables at least, through the Winter, and it is wise so to arrange that the ground may be provided with cover crops. The cost of the seed is but a small item, and the condition of the land will be so much bettered by the protection of a cover crop through the Winter that it is very poor economy to leave the ground uncovered. The cost of seed for oats, rye, turnips or rape would not exceed $1 per acre, and will be returned many times in the destruction of weeds, gathering of nitrogen, and preventing the wash and exposure of the ground during the Winter. It is, of course, argued by many that Fall plowing of the ground is advantageous in destroying the worms and insects, but I prefer the cover crops, trusting to the lime, ashes and salt for the insects. There is nothing which will so effectually hold the chickweed in check as a heavy cover or smother crop. That is a Winter growing weed, and will be very little affected by Fall plowing unless done very late in the season. While any or all of the above-mentioned crops are good used as cover crops, circumstances will, of course, have to determine which is most available. Oats will do well on the earlier vacated ground, but, of course, should be sown so as to give the largest possible growth before killed by the heavy frosts. Rye may follow the late sweet corn or any other crop which will permit working the seed thoroughly into the ground. Turnips may be advantageously sown any time during August right in the standing corn, and many will mature sufficiently before danger of freezing to sell or feed to the stock. Rape will make growth until late in the Fall, and may be drilled in among almost all the late crops. The benefits from these crops will amply justify the small expense of labor and seed, and the small garden will be benefited in the same proportion as larger areas.

PROFIT IN THE TOP.—By this I mean that the profit in any crop is whatever is left over and above the actual expense of producing it, and it follows that the heavier the top above the cost line, the larger will be the profit. In these days of unmerciful competition it is useless to expect or look for success in mediocrity, either in quantity or quality. The profits are always found in the maximum, and not in the average or minimum crop. The only hope then is to strive for the very best results both in quality and quantity. Fancy vegetables tastily put up, will always sell even in the face of an oversupply. True, some dealers as well as many private customers are unwilling to pay the price of painstaking on the part of the producer, but there are plenty who are willing to do so, and those are the customers to hunt up and stay by when found. I have found it not at all difficult to sell to certain classes of grocers and private customers also, at double the prices my neighbors were realizing in the open market. Of course, the stock had to be gilt-edge, but one can afford to make it that for double prices. Excellence then, in quantity, quality and prices obtained are the essentials to profitable returns for labor bestowed.

DARK FORCED RHUBARB.—In "A Winter Job," page 419, the profits of Winter rhubarb were to some extent discussed. This, however, was from the commercial standpoint, and in no sense was adapting the work to the everyday wants of the family. Now briefly, let us see what it is from the standpoint of a home supply. If the general reports of the fruit outlook are at all reliable then the apple supply, especially of Winter sorts, will be very short, and high prices will inevitably rule. No Winter-grown vegetable yet produced will so nearly supply the place of apples as will the dark-forced rhubarb. I make the distinction "dark-forced" for the reason that rhubarb grown under glass can from no point of view ever compare with that grown in the dark. Growing it under glass will, everything considered, be more costly than forcing it in the dark. It can be so easily and cheaply grown, either in large or small quantities that in the home the shortage of apples may be largely compensated for, and growing for the market will be all the more remunerative if high prices rule the apple market. From now on, give the rhubarb plants thorough cultivation and a liberal supply of manure to invigorate the plants as much as possible. Late in the Fall dig out the roots and leave them until thoroughly frozen. Exposure will not injure them, so they may be safely left as turned out until they freeze entirely through, when they may be set into the forcing place and grown fast or slow, just according to the degree of heat supplied. Any place will answer for forcing in small quantities. A corner of the cellar, a vacant storeroom or shed, or even a large box may be utilized. If the soil adheres well to the roots when brought in, they may be set close together with no soil placed below them or between the clumps. If well loaded with soil when set in they will grow nicely with little or no watering. I mention this fact for the reason that many might not have available room other than a storeroom or a large box placed in the kitchen even, and in this case watering to any great extent might be objectionable. As before remarked, it will grow in any place where the light is excluded and sufficient heat supplied to cause growth. This so simplifies the work that every family may be supplied the entire Winter through, as a very few roots will furnish a constant supply for an ordinary family. It is believed that trying in a small way will induce many to go into larger operations and ere long find profitable Winter work. J. E. MORSE.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

SOME NEW BERRIES.—Fig. 242, on page 547, is a fair representation of Burbank's leeberg blackberry as fruiting on the Rural Grounds. The plants were set last year, and naturally cannot produce a full crop this season, but the density of the clusters, of which two are shown in the cut, indicate it to be very prolific. The berries are of good size and of a very attractive translucent amber tint, so light as to justify the name of white. The flavor is not particularly pleasant, however, though it is the best of its type. There is some mawkish astringency even in well-ripened specimens. One can imagine these handsome berries sought after for garnishing and decoration, but not for their table quality. They are firm and handle well, but a bruise is soon followed by a brownish discoloration which mars their transparency. Iceberg is said to result from a cross of Lawton with the well-known old Crystal White, and is certainly an immense improvement on that variety in size and productiveness. Many white and light-colored blackberries have been introduced from time to time, but none has been found valuable except as curiosities, though there seems to be a place for Iceberg. The canes are vigorous and came through the past severe Winter without harm. The white blackberries, according to Profs. Bailey and Card, form a distinct variety of the common wild long-cluster blackberry of the East, Rubus nigrobaccus, and are found sparingly growing in mountain regions. A fine type of this class, bearing coral red berries, was found by the writer in Tennessee and transferred to cultivation. It is a beautiful fruit with a particularly agreeable sweet flavor,but is not sufficiently hardy in the North.

SOME CULTIVATED DEWBERRIES.—Everybody knows the common creeping blackberries of pastures and waste lands. The fruiting varieties are quite generally known as dewberries, while the sterile or pistillate forms are often called catbriers from their scratching propensities, and locally, in the expressive language of the bare-legged boy, as "rip-shins." The berries are generally liked even better than those of the high-bush sorts, and coming earlier, are heartily welcomed when enough can be had. The fruiting plants, however, usually are found in small proportion to the barren ones, which spring up in great profusion in the most unpromising places. Several species are described by botanists, those found in the West and South being quite distinct from the eastern forms. All are procumbent or trailing in habit, and root so freely from the tips that there is little need to produce fruits with their accompanying seeds to insure propagation. However, an occasional plant is found with perfect inflorescence, bearing profuse crops of fine berries. A number of such superior varieties have been transferred to cultivation, and have proven more or less successful. A few are still in commerce and are known to most horticulturists. Lucretia, which was found in West Virginia during the Civil War, and Mayes or Austin, which was found in Texas about 1880, are undoubtedly the best examples. Plants of these varieties received last season from Wm. F. Allen, Salisbury, Md., made a fine growth, and fruited heavily this year. They both belong to the common eastern species, Rubus villosus, and there is much resemblance in growth and appearance of plant. Lucretia produced the largest and best-flavored berries and Mayes the firmest and most perfect specimens, while it was by far the most productive. Lucretia is about a week earlier, and the more rampant grower. It evidently does not pollinate its blooms as well as Mayes, as a much larger percentage of imperfect berries was found. Of the excellent table quality of these native berries there is little difference of opinion. Everyone seems to like them, and they can be put to all uses of which a blackberry is capable. They come in with the red raspberries, and fill a useful chink between currants and bush blackberries. It is some trouble to handle the viciously thorny canes, but it looks as though the result would warrant the trouble. Notwithstanding the long time Lucretia has been before the public it has made little headway in popular esteem; mainly, we think, because plants of ordinary pistillate varieties were sent out in place of the true one. Unless care is taken to root tips from actual bearing plants it is easy to get hold of common wild ones, which are sure to spring up under cover of the cultivated plants.

MANATEE, from Reasoner Bros., Oneco, Fla., winterkilled badly, and only produced a few imperfect berries of good flavor. It belongs to the southern species, R. trivialis, and is a selected strain from the Florida woods.

CALIFORNIA MAMMOTH, from James Waters, Watsonville, Cal., is a supposed cross between Rubus vitifolius, the western dewberry, a most unproductive plant in its natural state, and a bush blackberry from Texas. It originated with Judge J. H. Logan about the same time as the Loganberry, which had the same dewberry for the seed plant, but was pollinated with an European red raspberry. Mammoth endured the Winter perfectly, the unprotected plants coming through rather better than the covered ones. They bloomed profusely and ripened a considerable crop of long, well-flavored berries, which, however, did not reach the great size figured in California specimens. It is a handsome plant with broad leaves like the Loganberry, but a more erect habit. The canes trail and root freely at their tips. We think this distinct variety will do better another season, and will have more to say about it in the future.

THE RATHBUN is again the best bush blackberry we have under trial, excelling all others in size, productiveness, color, firmness, and when thoroughly ripe, in flavor. It is entirely hardy here, and has not yielded to the Orange rust or other disease during a four years' trial. Mersereau is an improved Snyder, larger, more productive and holds color better, but does not come up to Rathbun for real utility. The older blackberries do not succeed well in this immediate locality, though they were much planted in former years.

CUMBERLAND and Kansas blackcap raspberries take the lead among their type, with a preference for the former as larger and more vigorous.

MILLER RED and Cuthbert are the preferred red varieties. Cardinal, A. H. Griesa, Lawrence, Kas., is disappointing in size and color as fruited this season. The berries are firmer than Shaffer or even Columbian, and are very freely produced, but they are much smaller in size, about like Cumberland, and rather dull purple when ripe. There is not much cardinal color about them when ready for the table, though the red tint is bright enough just before they are ready to pick. The flavor is acid, but of the usual agreeable quality of the purple-cane type, now considered to be made up of natural hybrids between species producing red and blackcap berries. Many intentional crosses have been made between black and red-fruited raspberries, and something like the purple-cane type generally results, but none has proven of value. Cardinal makes a splendid plant of strong upright growth, and roots easily from the tips. Shaffer is too tender, though the great size and excellent quality of the berries make it a favorite in many gardens. Columbian is hardy enough, but entirely too dull in color for market purposes, though it is liked for drying. We have trouble on the Rural Grounds owing to exposed location, with the young canes of purple and blackcap varieties twisting off with the wind. Columbian is usually badly wrecked before the new growths harden by easterly storms, but our Cardinal plants are of such sturdy, erect habit as not to be affected. They passed last Winter without harm from cold.

W. V. F.

Stringfellow's Method of Planting.

A. C. Worth, of Bergen Co., N. J., says that he has tried the Stringfellow plan of cutting roots of transplanted fruit trees back to a mere stub, and that the experiment has been highly successful. When asked whether he followed Mr. Stringfellow's plan of avoiding culture entirely, he said:

"I must admit that I did not carry out Mr. Stringfellow's method, except as to cutting away all the roots and cutting back the top of both trees and plants to a stick not over two-thirds of the former length. I have cultivated all trees, just as though they were corn, and kept shrubs well worked with hoe and rake. In one case, where I received a lot of plum trees in May, in full leaf, I cut back both roots and tops, and every tree lived and made a fine growth this, the second season. The more I study the matter the plainer it is to me that the new root growth, by this method, is far better than the old way of saving as many roots as possible, especially in the case of trees which have to be transported any distance. I shall try some peach trees this Fall, set in holes made with a crowbar, and will only cultivate to keep down the weeds and grass."

EARLY VEGETABLES.—How is this for a late season? New potatoes ,June 9; peas, June 6; strawberries, June 4; beets, June 9; carrots, June 9; cauliflower, very fine, May 16. Tomatoes are now turning red;will pick next week, and lots of nice early Wakefield cabbage. I forgot to say we picked new beans July 2, Marvel of Paris. Refugee was planted two weeks earlier, and only now coming in.

F. R. T.

Long Island.

THE MANAGER'S SHARE.—As to the wages due the fruit manager on page 533, a person capable of properly superintending the planting of 2,500 apple and 2,500 peach trees, on 50 acres of land, and managing the work of caring for them for the first five years, ought to be worth $1.50 per day without board. If really expert in managing men and caring for trees he would be worth more than that. I don't see how one could make an intelligent estimate of the amount of time it would be necessary for him to put in at it, especially as nothing is said of the nature of the land or the methods of planting and culture. I think a manager should have at least $100 and perhaps double that amount. If they have good crops of peaches to market (as they should have) it would be no small job to attend to that. It seems to me that the business-like way is for them to agree on the value of the manager's time, and his partner pay him one-half of said value, for every day he puts in attending to their mutual interest.

Hope Farm Notes

CROP OUTLOOK.—The first of August finds a farmer pretty well in sight of his Summer's crop. While August may settle the corn and the apples for good or bad most of us know by this time about what we can expect. It is a good time to view the situation and see how we stand. It is hard sometimes to be quite fair with our own crops and property. We can view our neighbor's farm with a critic's eye, but it is hard to be quite so just with our own.

FODDER.—We are going to have a fair supply. One of the "Clark" grass fields was much better than we expected, and is greening up for a good second growth. Mr. Clark writes me that he does not think the Timothy will come in later unless we sow more seed. He says he is trying a new tool for doing this. It is a large cylinder with 72 sharp saw-like teeth on it to rip and turn up the sod. After this has been run over the ground he thinks we can sow Timothy and roll with a fair chance of getting a "catch" and still leaving enough Red-top. . . . Our oats were rather better than oats usually are in this country. There was no smut where the formalin was used. They were all cut for hay. I have told of one field at the back of the farm where last year we had corn with corn fertilizer broadcast. We put oats there this year with no fertilizer and had a fair crop. . . . I am much pleased with the looks of the clover and Orchard grass which we put in with oats last Spring. There is every appearance now of a good late crop—mostly clover. While most of our hay was wet more or less it is all suitable for fodder, but not for sale.

CORN.—Our crop was planted late, and the long wet season has held it back, but it is jumping hard just now. The color on part of the field is too light to suit us. We have put on fertilizer and shall keep working it as long as we can get through it without injury. On the whole, I do not think our chances are good for a heavy crop of grain. With us the stalk is nearly as important as the ear. We are still planting sweet corn on the hill tops, and should the frost hold off as late as it did last season we shall have ears on it. The sowed corn fodder looks well—and it will all be needed.

POTATOES.—I have never known a season when it was so hard to make a fair estimate of the potato crop. The tops may be all right, but when you come to pull up some big, fat fellow you find that he is all top—with few suitable tubers. I figure on a light crop, though the vines are still growing. Where we put on the nitrate of soda and sulphate of potash the vines certainly "show their oats" in the way they spread and climb. The Junior Pride is ahead of everything else in our field for earliness. June Eating must take a back seat for earliness, though I am not yet convinced that the Junior is a more profitable potato, when all points are considered. Most of the Juniors could have been dug and sold by August 1, but I believe this year it will pay to let our potatoes stay in the ground until they are fully grown. Some years it pays to dig when the tubers are two-thirds grown, and thus get the dollar-a-bushel price. This year I shall wait for full size. If we were to judge from the appearance of the vines alone the second-crop seed of both Junior Pride and June Eating is better than the late northern-grown. From the start the second-crop seed vines have been more vigorous. From the way they have grown I quite expect to find more large potatoes in their hills, but digging only will determine. Last year at digging many of our potatoes were alive with weeds. It is a fact that we had to go in with the mower and cut many weeds down. This year there is hardly a weed to be found. We planted in hills and worked both ways with the cultivator, and the children took the job of hand pulling when the weeds were small.

APPLES.—Our Greenings are well laden with fine fruit. They really ought to be thinned. The early apples looked well, but are dropping badly. Within a few days the ground was nearly covered with fine apples—not quite ready to pick. There will be a fair crop left, however. We are utilizing the fallen fruit better than in former years, since we have more pigs and better facilities for feeding. One of our neighbors, a Salvation Army officer, has a great crowd of "fresh-air" or slum children on his farm. Hugh says these young folks are like sheep in an orchard, ready to catch an apple before it strikes the ground. We are glad to have them fill up on all the windfalls they can pick. We may be responsible for a great harvest of stomach ache, but that is soon over with the young. Old Frank got more than his share of apples the other day, and enjoyed a good case of colic. It does hurt my feelings to see so many of those windfall apples going to the pigs—or worse—while poor folks in town and city are unable to buy apples even for cooking. Last year I tried to sell windfalls, but there were too many in the market. They may do better this year.

POULTRY.—The first run of the incubator was a dead failure. Later runs did better, and the sitting hens helped out, so that we have 196 chickens. We have eaten some of the old hens, and shall devour others later. As soon as the young roosters are large enough they get right into the frying pan. There is no use in keeping them longer. People argue about the most profitable time for egg production. Right now in our country would be the best time. The county is full of Summer boarders and fresh eggs will bring three cents each. As we all know, there is no time in the year when the natural egg food, such as insects and green crops, are more abundant than in August. Yet the hens demand a vacation, and want to do the bulk of their work in March and April! We hope to make them lay in August and September this year—not eggs but celery! Philip is a good celery grower, and we will give him a chance to show his skill. He has put the year's accumulation of chicken manure in the bottoms of his trenches. Thus the hens will lay celery during the lazy months.

ODD CROPS.—Our rye went to the barn in good condition. We shall have it thrashed late in August. The bundles of straw will be carefully tied, and I expect to sell it all. Can a farmer afford to bed his stock with $18 rye straw when he can buy planer shaving at $1 a load? I do not think so, and I shall sell all the rye straw I can. I would also sell Timothy hay at the usual selling price in our locality and buy bright corn-stalks at the price which farmers charge for them. I could run the stalks through my shredder and make it nearly equal, ton for ton, the higher-priced hay. . . . . Turnips are making a fine growth this year. We have usually had 200 or more bushels of small potatoes to feed to the stock each season, but I believe such potatoes will sell this year for more than the hogs will pay. We are sowing turnips and rape at intervals whenever we get a piece of land clear. The yellow turnips are up and doing well. Now is a good time to sow the Cowhorn turnips. . . . The cabbage did well, though later than usual. The price is low. As for late cabbage the country seems to be full of it, and if the weather is at all favorable I do not see how the price can help being low. It is true that when the potato crop is short all such crops as turnips, cabbage and beets are likely to be used as substitutes, but I thought so poorly of the cabbage outlook that I set out less than 3,000, against 12,000 last year.

LIVE STOCK.—The pigs have paid us well. We have sold $30 worth thus far, with more to go. At present the cost of feeding the pigs is very little. They have all the apples, turnips, cabbage and weeds they will eat, and have little room left for grain. Of all grain to be fed with so much green stuff I prefer corn. The little pigs that run with the chickens will pick up cracked corn as easily as a bird. I know farmers who use cornmeal as a medicine when the cows get to the orchard and eat too many apples. What a mistake it is to keep the pigs, and especially the idle sows, penned up at this season, and fed chiefly on expensive grain. It seems to me that the chief profit in the pig business on our eastern farms is to be found in turning what we cannot sell in the market into pork. . . . Our lively colt is growing fast. Charlie has already put a halter on her, and we purpose to have her grow up with the idea that halter and harness are as much a part of her as head and tail. I begin to think I would like to keep that colt for my own driving some day, but I hope she will grow into something a little too nervy and stylish for a plain farmer! It used to make me smile to hear farmers tell about their fine stock, and unwind a yard or more of pedigree. Now I catch the same smile on the faces of others when I get started on the relatives of our black Berkshire lady and Maria, the colt. Well, after all, it is a good thing for a farmer to show his confidence in his stock or farm—provided he doesn't blow his horn too hard.

H. W. C.

New Use for Fair-Ground Buildings.

The fresh-air camp is located on the fair grounds near where I live. The children occupy the big halls, and a right good place it makes for them, too. The great city of Cleveland pours out a vast swarm of its poorer class of children every Summer to enjoy the country air and scenery, and they appreciate the opportunity to its fullest extent. The children brought out at one time are allowed to stay two weeks, when they are returned to the city and a fresh supply of eager ones take their places. Church societies take turns in supplying food for them for one week at a time. Recently one of my neighbors passed among the children. He was dressed in overalls and work clothes. One of the girls, as soon as she spied him, cried out, "Oh! here's a farmer, here's a farmer! Oh, how I wish I was a farmer, for then I'd have all the fresh eggs, and milk, and butter that I wanted to eat." How much that meant, none can know except those who are deprived of these good things of life. Fresh eggs, good milk, and sweet, wholesome butter! There's meat and drink for you of the very best kind, and crowned with a luxury that none may know, who eat the counterfeit oleo. A. R. PHILLIPS.

Chagrin Falls, O.

NOISE IN WATER PIPES.—Your Hope Farm man, some time back, mentioned in his Notes that the Madame is quite annoyed by the pounding and racket caused by the pipe connection from his windmill with his range in the kitchen. I have not noticed anyone giving him a remedy. What is wanted is a deadening expansion joint. A piece of piping is taken out anywhere along the line; if a foot long only it will do, or it might be four to five feet. Then a piece of rubber hose is slipped over the piping on each side from which the joint has been removed, this is then tightened with clamps and the whole business is done.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, AUGUST 10, 1901.

To January 1, 1902, for 25 Cents

The time for subscription work is again with us. During August and September we shall send THE R. N.-Y. every week for the remainder of the year for 25 cents. You can get up a little club in your neighborhood. Do what you can. Keep 10 cents and send us 15 cents with each name. If you can send a club of 10, keep 15 cents for each, and send us 10 cents with each name—the 10 for $1. Experience has taught us that it is the small clubs of this kind sent by our old friends that are most valuable. If you want samples, blanks or other supplies, write for them. They will be sent promptly and gladly. The sooner you send now the more papers your neighbors will get before January 1. Act as soon as possible.

*

THE New York State Fair, to be held at Syracuse, September 9-14, promises to be one of the best ever held. It was feared at one time that there might be some conflict with the Pan-American Exposition over the exhibits of live stock. The matter has now been fully arranged, and a fine show is guaranteed. With ample funds to back them the commissioners have made abundant arrangements for entertaining a great crowd, and it is to be hoped that the grounds will be crowded.

*

A FIELD meeting of the New York State Fruit Growers' Association will be held at Olcott, Niagara Co., on August 14. The principal address will be made by Hon. W. H. Blodgett, of Worcester, Mass., on "Fruit Packing and Marketing." This will be a good meeting. All farmers who can do so should attend. It pays to rub elbows with your fellows. Coöperation ought to fatten on "elbow-grease," and now as never before do New York State farmers need a strong organization.

*

THE fearful heat which swept over the West blasted the meadows and pastures as by fire. In some cases it is reported that Timothy and similar grasses have been destroyed, root and stem, so that reseeding will be necessary. Here and there, green amid these dead meadows, are patches of Alfalfa still alive and ready to grow at the first fair rain. This wonderful plant needs just such a trying time properly to advertise itself. It sends its long roots deep into the soil, following the water level as it retreats before the sun, and keeps on pumping water, while the shallow-rooted plants are dying. Great is Alfalfa—where the soil suits it.

*

THE Borough of Brooklyn, City of New York, obtains a good share of its water from wells driven in various nearby parts of Long Island. Water is pumped from these wells, and so much is taken that the farms have been sucked dry, and crops are ruined. Farmers have brought suit against the city for damages and have usually won. The principle is clear that an outsider cannot deprive a farmer of the surface water that runs over his farm. The underground water is of even more importance. A farmer owning a farm worth $6,500 recently claimed damages for $75,000. Justice Marean, of the State Supreme Court, says that no farm land on Long Island, with or without water, is worth for its annual use, more than five per cent of its sale value! What nonsense that is when we reflect that the farm represents the farmer's capital, which is to give him a job, pay his bills, provide for his family and give him any possible profit. A merchant with $10,000 may be forced to do a trade of six or seven times that amount in a year in order to pay his expenses and develop his business. The loss of the water ruins the farm, throws the farmer out of a job and destroys his earning capacity on that spot.

*

No sooner was the drought broken in Kansas and Missouri than the farmers hurried to town and began buying seeds for forage crops. Turnips, sorghum and rye will be largely planted. They have ceased to sell off their stock, and in spite of all the pessimistic reports we have received, the drought-stricken States are very far from agricultural ruin. One of the most encouraging features is the attitude of the farmers themselves. They do not sit down to lament the hardships of the season, but take hold willingly to fill up the gaps in their ordinary farm practice. This year will see a good many very practical experiments in fall forage crops.

*

WE should judge that the Summer boarder crop is growing well this year. On the farms within 30 miles of New York and many other cities, the business of fattening a city family pays better than putting flesh on the ribs of a middleman. These people with brick and stone in their pedigree may not know much about farming, but they usually have remarkably healthy appetities. They make good customers for milk, chickens, fruits and vegetables, and if a farmer knew how to handle them he can make the crop pay. It is a job, though. The man who taketh a city is said to be great, but he is a dwarf beside the man who can take a reef in his patience in the face of the questions of the city man and the pranks of his children!

*

ON one of the tables of the fruit exhibit of the State of Washington at Buffalo we found the following written notice conspicuously displayed:

As the children of Lebanon passed through the land on that day, they saw the fruit, but according to the law of the land they ate it not.

And the Lord said unto Moses: Thou mayst behold the land, but thou shalt not enter therein, nor shalt thou eat the fruit thereof.

The last quotation does not strike us as a very strong immigration document, but it is a good hint to the people who seem to consider the fruit on an exhibition table and in a farmer's orchard as common property. Why not try one of these texts on a board as an orchard sign?

*

WE are having quite a little discussion over the wisdom of spraying potatoes with Bordeaux Mixture. Thus far the discussion has been confined to the practical men. After all, such questions must finally be settled to suit the conditions of the man with only one team and one pair of hands. In our own experience we have found that the use of copper on the vines will pay, provided you can get it on at the right time. The trouble is to apply it just when it is needed. We can see how a field or a plot at an experiment station can be kept "copper-plated." Where a man is growing potatoes as a great special crop, with few others to interfere, he ought to be able to use the Bordeaux in time. The average farmer often has too much on his hands, with hay or corn or grain all demanding immediate attention.

*

LAST week we referred to the statements made by Dr. Koch, the great German scientist. He says that bovine tuberculosis is not transmissible to humans. Dairymen are hailing this statement with great joy, for they have long felt that much of the warfare made against the cow by inspectors and radical scientists was unjust. While this statement by Dr. Koch will probably do much to stop the so-called testing and "stamping out," there is another side to the matter that should be remembered. This quotation from the New York Journal gives the opinions of many consumers:

The theory of Professor Koch that consumption cannot be transmitted from animals to human beings is cheering, but its publication at this time is perhaps a little indiscreet. Even Professor Koch is not infallible. Lord Lister and other distinguished experts disagree with him. His views do not meet with favor from the majority of the members of the Congress of Tuberculosis. But his name is quite sufficient to confirm unscrupulous dairymen in working off diseased milk upon the public. Such conscience as they may have would be put to sleep very readily by his authority. And he will naturally secure disciples among health officials, who will accordingly relax the rigor of their inspection. If, after all that, it should turn out that Dr. Koch was wrong—as many distinguished specialists vehemently assert he is—what irreparable damage might be done! And how painful the situation would be for Dr. Koch!

Such city people fear that in some way the milk will be more dangerous, and that sanitary inspection will be relaxed. Nothing of the sort will happen. Farmers understand that the city's consumption of milk ought to be doubled, but that it cannot be until city people are convinced that it is pure and healthy. There will be no backward step in consequence of this new argument in favor of the cow as our great National wet nurse. It will, in time, save the dairyman much trouble and annoyance, but there will be a rapid and steady improvement in the methods of making and handling milk. The middleman does far more damage to the milk than the old cow ever did.

*

MUCH is said about getting down to the common people in speaking and writing, and some seem to think that this means to talk or write about only the most simple or childish things. Just the reverse is true. A man not versed in Latin or Greek does not enjoy a discussion peppered with words of this class, but no mystery of nature is too deep for him to enjoy if presented in understandable language. Those who talk to audiences of children sometimes make the fatal mistake of thinking that they must be childish in their talk. A look of disgust may be seen on the faces of the bright small boys, when they are obliged to listen to wishy-washy baby talk indulged in by the speaker under the impression that he must do this to interest the children. He ought rather to pick out some topic big enough to appeal to grown people, and talk about it, leaving out unnecessarily big words. Then both old and young would be interested.

*

THERE has been a long contest in New York State over the right to transfer to a second or third party the unused part of a railroad ticket. Laws were passed prohibiting the sale of such tickets, but the Court of Appeals has declared the last law unconstitutional. Here is the pith of it:

It is evident that whatever may be the nature of the arrangement which is evidenced by the ticket, whether it be a token or prima facie evidence of a contract, when the ticket is sold it belongs to the person who buys it, and unless its use is in some way limited it has the same quality as every other kind of property.

In other words, suppose I buy a ticket which entitles me to a ride from New York to Syracuse and return. When I reach Syracuse for some reason I do not wish to return. I have paid for the return ride and unless I have made some special agreement I have a perfect right to sell or give away that ticket. It seems to us that this decision may be regarded as good law and good sense.

*

BREVITIES.

Just take your good old mother, boy, and put her side by side
With neighbor Johnson's daughter, whom you hope to make your bride.
The work-worn, faded mother and the girl all fresh and bright—
No doubt the younger woman is more comely to your sight.
We wouldn't have it otherwise—yet here's a thought, young man;
Old neighbor Johnson's daughter never did and never can
Do for you what your mother did long years and years ago;
A note is written on your heart that you will always owe.
Of course, a man should give first place and honor to his wife;
That's right, my son, make that resolve the rudder of your life.
But give the good old mother, too, a corner in your heart;
Your wife will never miss the space for mother set apart.

LET the potatoes ripen this year!

YOUR lot is not the hardest in the world!

IN April the hen lays often—in August she lays off.

WHAT shall we do for Winter apples? Force rhubarb.

BURN wood, and as little of it as possible this hot weather.

GOES without saying—the fellow who minds his own business.

THEORY is a thing that should not be purebred. Cross it with practice.

IT is not likely that a growing season will follow the growing season this year!

THE way to get favors is to give them to others. "He that humbleth himself shall be exalted."

WHEN does life become not worth the living? When there is nothing that you are willing to toil and deny yourself for.

How many farmers who do not like the experiment station bulletins have ever written the directors telling what they want?

DR. BORDEAUX MIXTURE does not pretend that he can cure sick plants. He can prevent disease if you let him get ahead of it.

THERE seems to be some controversy about the merits of the various moth traps on the market. We would like to have readers who have tried them tell us what insects they catch, and whether they are worth buying.

ACCORDING to the census returns of Alabama, the colored voters of that State have gained 7.3 per cent in educational progress, while the whites have advanced only 2.1 per cent. This speaks well for the influence of Tuskegee Institute.

FARM laborers seem to be learning how to strike. On an Indiana melon farm the pickers and haulers struck for fair wages. The county was scoured for other workmen without avail, and the strikers got their price. Suppose the farmers of the land were to strike for a year!

Events of the Week.

DOMESTIC.—A Hindoo stoker on the German steamer Hohenfels, which arrived at New York July 22, developed bubonic plague. The ship was quarantined and thoroughly disinfected. . . . . July 25, a fire at Davenport, Iowa, caused damage amounting to $700,000. An area equal to 20 city blocks was burned over, destroying residences and factories. Long drought had made the buildings as dry as tinder, and the intense heat caused many prostrations. At least 100 families were rendered homeless. . . . . A flood which left destruction in its wake coursed over 50 miles of territory in Colorado, July 27, starting at the head of West Four Mile Creek by a cloudburst and extending through the valley to a point below Canyon City. The damage will reach over $40,000, including the loss to ranches, stock, growing crops and country roads in Fremont, Park and Teller counties. Many ranches are entirely swept away and a number of people are reported to be homeless. Heavy rains made worse by a cloudburst are the cause of the flood. No fatalities have been reported. . . . . The Federal Government has begun suits in New York and New Jersey looking to the recovery of a part of the $2,250,000 alleged to have been embezzled by Oberlin M. Carter, late captain of the Engineer Corps, United States Army. Receivers have been appointed for property in both States held by Carter's uncle and brother for the benefit of Carter while he is serving out his sentence in prison. . . . . George H. Phillips, of the Chicago Board of Trade, reported to the postal authorities, July 30, his discovery that the country had been flooded with circulars emanating from New York asking for subscriptions to a $2,000,000 fictitious pool for a deal in September corn.

CUBA.—The government has offered a reward of $1,000 for the capture, dead or alive, of Lino Lima, a bandit, who has been operating in the Matanzas and Havana provinces. There has been for the last three months a standing reward of $500 for Lima's head. July 26, the bandit sent word to the authorities that he would surrender for $500, provided he were allowed to leave the Island. Upon receipt of this offer the authorities doubled the reward and sent urgent instructions to General Rodriguez of the Rural Guard to capture Lima.

GENERAL FOREIGN NEWS.—An explosion of petroleum on the American schooner Louise Adelaide, Captain Orr, which left Philadelphia April 24 for Stockholm, which occurred in the harbor there July 23, resulted in the deaths of Captain Orr, 10 members of the schooner's crew and four Swedish customs officials. Only two of the crew were saved. The explosion set the schooner afire, and the blazing petroleum enveloped the vessel and those on board. . . . . The new German tariff, if enforced, would be found particularly severe on Russia, Austria and the United States, but it is thought at Berlin, according to a special cablegram, that the Bundesrath will not confirm it. . . . . George Kennan, the American author and journalist, has been expelled from Russia. This was due to his severe criticism, several years ago, of the Siberian exile system.

FARM AND GARDEN.—The Pennsylvania State Forestry Commission has purchased land at Carlisle for the purpose of establishing a college of forestry.

The Denver National Live Stock Association has issued a warning against hasty acceptance of the Koch tuberculosis theory.

Arrangements have been perfected whereby a large exhibit of wool will be made at the Pan-American Exposition during the time of the sheep show, from September 23 to October 5. The classification will be a purely commercial one for clothing, combing and carpet wools, and the jury will make the awards on the standard known to the trade. Entry blanks will be furnished upon application to F. A. Converse, Superintendent of Live Stock, Agricultural Building, Pan-American Exposition.

The special Summer meeting of the American Forestry Association for this year will be held at Denver, Col., August 27-29, in affiliation with the American Association for the Advancement of Science. This meeting will be a distinctively western one. It will deal with the forest problems before the Western States—fires, grazing, relation of forests to water supply, etc. The Federal Government, more than 10 years ago, recognized the importance of the preservation of the forests in protecting the timber resources and conserving the water supply, and there have now been established in the States and Territories west of the Mississippi 40 forest reserves, containing nearly 47,000,000 acres.

The twenty-fifth annual session and exhibition of the Georgia State Horticultural Society was held at Milledgeville, August 7 and 8. P. J. Berckmans is president and L. A. Berckmans treasurer.

The Canadian tariff imposes a duty of three cents on each budded or improved fruit or shade tree imported, and an ad valorem duty of 20 per cent on shrubbery from the United States; but seedling stocks for grafting and florists' stock in general are admitted free of duty.

Two of the largest hogs ever shipped to this country were received at the United States Cattle Quarantine, Garfield, N. J., July 26. They are consigned to George W. Vanderbilt, at Biltmore, N. C. One weighs 800 and the other 740 pounds. After a 15 days' quarantine they will be sent to Biltmore.

Up to July 20 the four bee inspectors of the New York State Board of Agriculture examined 416 apiaries, embracing 13,393 colonies. Of this number 229 apiaries were found more or less infected with black or foul brood, and 1,834 colonies were condemned to destruction, or to be treated with such remedies as have been effective. The Department has prepared a small bulletin on bee diseases, which gives approved methods of treatment, a copy of which will be sent to applicants. It is a source of gratification that those apiarists who followed the instructions given by the inspectors have been very successful in the care of their apiaries.

Immediately after the rain, which fell in Kansas July 27, farmers began to buy seed for forage crops. Heavy purchases of sorghum, turnip and rye seed were made. Farmers in the Leavenworth section will sow large fields in turnips. They make good pastures until late in the season, and then the turnips can be used for stock during the Winter. Some farmers report there will be considerable late corn and the rain will make fodder. Farmers will make no further efforts to sell their stock. Several varieties of vegetables will be replanted. The rain was timely for apples and pears. The wind blew a little fruit from the trees, but the damage was light.

The first Summer meeting of the Wayne County (N. Y.) Fruit Growers' Association will be held at the Case fruit farm, Sodus, N. Y., on Saturday, August 17. The speakers will be Prof. M. V. Slingerland, of Cornell University, and H. W. Collingwood.

WHEAT AND HESSIAN FLY.

The Hessian fly has not bothered this locality any this season. The wheat is an extra good crop here this year. The fly took all the wheat here last season. The only variety that withstood its attack at all was the Mealy, and that partly succumbed to it, but the other varieties were a total failure. The variety you mention, Dawson's Golden Chaff, has never been raised here to my knowledge. H. G. H.

Delightful, O.

The wheat crop is unusually good this season. The fly has done practically no damage. Farmers sow after September 15 to avoid the fly, and a great deal more Golden Chaff wheat is grown now than before. We do not know why it does better than other kinds; probably it is less susceptible. The different varieties are known by local names, generally named after the man who first introduced it into a certain locality. D. D. B.

Ringtown, Pa.

There has been but little damage done by the Hessian fly, and that was last Fall. All varieties met about the same fate. As to some kinds doing better than others, such is the case, but that is attributed to soil and locality. The Dawson's Golden Chaff is comparatively new here, and not tested enough to determine its merits. The varieties raised are Fultz, Pool and Michigan Amber. The yield has been from 18 to 30 bushels per acre, and the quality very good, some weighing 62 pounds per bushel.

Rockville, Ind. H. B. B.

Two of my neighbors have one 20, the other 10 acres adjoining, of what is known as Democrat, a bearded very white straw red wheat. This looks as though it would yield 30 bushels per acre, with very little effect of the fly. One man has a field of another variety that will not yield five bushels per acre. The only good wheat in this neighborhood is Democrat which, I think, is generally fair. Many fields will not return their seed. My wheat, known as Bullion, will not yield 10 bushels, scarcely enough to pay for harvesting. Hay is a good crop, but not much that will be salable; too much rain during the harvest. Corn backward; barley and oats good except on low land. J. E. D.

Junius, N. Y.

CROP PROSPECTS.

JULY 22.—Potatoes are not sprayed with the Bordeaux Mixture in this vicinity. In my own case I have tried to ward off the blight by selecting my seed at digging time from hills with healthy strong vines that remained green until frost. In this way I have been able to grow healthy plants. The present outlook for potatoes is not very encouraging, especially late planted. The weather is scorchingly hot, and potatoes are suffering from the heat. Wheat, oats and barley are good, though the hot weather is pushing them along too fast. Corn is doing well. L. N. N.

Laney, Wis.

JULY 25.—As to early vegetables, we had none in this section except asparagus, the others didn't get planted in season on account of rain. Peas were fit to pick about the same length of time after planting as usual, but very poor in quality, as is all fruit picked up to this time. Apples are very scarce and inferior. Potatoes are not as large as hen's eggs, even those planted reasonably early. A. D. G.

Arlington, N. Y.

JULY 23.—I am sure nearly all vegetables here ripened about one week later than other years; tomatoes about two or three weeks later. They are scarce yet and worth about two for five cents. Yesterday was the hottest day known around here; it was 111 degrees in the shade. Everything is suffering from heat and drought. It has not rained here for a month. The market gardeners around here practice mixed farming; they raise their own feed for horses and cows, raise garden truck and onion sets from their own seed, and some have onion seed for sale. The dry weather has not injured the onion crop. Large onions are ripe, early sets ready to dig next week. I have four acres of nice yellow seed ready to cut the end of this week. The onion crop is quite as early as in other years. J. P. D.

Madison, Ind.

JULY 27.—It is almost impossible to give you any reliable data on the apple crop at this time. The weather is very dry and hot throughout the apple section, and if it remains so long will have a disastrous effect. It already affects size of Summer fruit; some of the latter is actually cooked upon the tree before it matures. Temperature 110 degrees in the shade. Some of the older trees (20 years of age and upwards), are loaded with fruit; young orchards as a rule have but little, and they comprise the larger acreage. Orchards of 10 to 15 years of age are a mixed proposition. Some have no fruit at all, while others have a sprinkling of fruit throughout. In other orchards some of the trees are loaded while others have little or no fruit. On the whole, I would say about 40 per cent of a good crop would be a generous estimate under present conditions; Ben Davis light.

Savoy, Ill. H. M. D.

JULY 29.—I think we never have a reason when *all* crops are good. Something is a complete or partial failure every year. This year the hay and wheat crop were phenomenally large. The prospect for peaches was never better. Corn is not over three-fourths of a crop. Many farmers will be disappointed at silo-filling time. Oats are hardly up to the average, and late potatoes are very late, with only a small acreage. We are looking for high prices next Winter and Spring. He who has, will doubtless do well to hold. Apples are not over one-fourth crop, and the best Winter varieties are scarcest of all. Rains are plentiful, pastures and meadows are green and fresh. We have had no drought this Summer, and no temperature above 98 degrees at my home. Oat harvest has just begun (last of July), and we are having a catching time of it, owing to the frequency of the blessed rains. A. R. P.

Chagrin Falls, O.

JULY 27.—A very small crop of apples in Maine this year. In spite of continuous rainy weather at blossoming time apple trees that bear cider apples and some others set fairly well. Hay in this section more than doubled that of last year; throughout the State it will average about 50 per cent more. My own fields cut three times more than in 1900. Some old fields in this section cut no more. There is an increase in the number of acres of silage corn each year, and although late it is now of good color and growing well. We have thought the Leaming best suited to our climate, but have experimented this year with three other varieties. J. H. R.

Portland, Me.

JULY 30.—We have had an unusually wet season. Nearly all crops have suffered from the cold wet Spring. Wheat is nearly a failure and the crop has been largely abandoned. Potatoes were planted late and largely in compact wet soil, and they will require most favorable conditions if an average crop is secured. Many were not planted till late in June. Our late planted potatoes we usually spray two or three times, beginning when the vines are suitable size. Our early potatoes are a very encouraging sight at this writing, fast closing up the rows, full of health and vigor. We gave them an application of 800 pounds per acre of nitrate of soda, acid phosphate and muriate of potash. C. W. B.

Phelps, N. Y.

Crop and Weather Report.

Conditions in Kansas and Nebraska have improved, rains having come in time to help the late corn. The drought is still serious in the Ohio Valley, where corn is in a most critical condition. Winter wheat harvest is in progress in Washington, and the yield is fully equal to expectations. Spring wheat is being cut in the Red River Valley. Both quality and yield are below the average on account of excessively early ripening. The last of the oats in the extreme North are being harvested. The crop in the North Atlantic States is generally light. The cotton prospect has improved, clean fields and good growth being reported over a large part of the belt. In the Ohio Valley and Tennessee the tobacco plant is suffering from the dry weather. In New England and the Middle Atlantic States it is making a fine growth. There is no improvement in the apple outlook. Secretary of Agriculture Wilson is making a personal investigation of the drought damage in the West.

The Potato Crop.

In central northern Ohio potatoes will be short. Early potatoes do best planted about April 15, but this year they are no better than those planted in May. The cause is a very wet Spring followed by very hot weather. From June 24 to July 17 inclusive we had 15 days with mercury at 90 or above. Of course, this extremely hot weather was too much for the early potatoes, and early-planted late potatoes are not doing well. Owing to help being hard to get the Potato bugs have done much damage. Our late potatoes do best planted about the middle of June, and it is too early to tell much about the crop, only that most farmers got a poor stand, seed rotting very badly. Only those who planted small tubers whole have a good stand. W. W.

Cut and Shredded.

It is reported that 3,000 cases of California dried peaches which were shipped to Seattle, Wash., were condemned by the fruit inspector there as wormy and unfit for use.

The English wheat harvest began the third week in July. This was earlier than usual, having been hastened by the hot weather. Mark Lane Express says that on five per cent of the area sown the quality and quantity of the grain will be fine; 25 per cent will be a fair average, and 70 per cent below average. The straw crop will be the shortest in eight years.

The Pacific coast lumbermen have submitted to the western railroads their estimate of the number of cars they will need to handle their output for the next four months as follows: Lumber, 10,400 cars; shingles, 10,600. The heavy wheat crop in the Northwest will tax the carrying capacity of the roads greatly for the next few months, and they are getting extra equipment as rapidly as possible.

GRANGE FIRE INSURANCE.—Having been a director for 20 years in the Farmers' Reliance Fire Insurance Company of West Jersey, I thought some of your readers would be interested to know how we are getting along. Our company was organized over 21 years ago, composed wholly of those who belong to the Grange, comprising several counties, each county having two directors. We insure for one-half of one per cent, it being perpetual as long as the assessments are paid. The assessments for 21 years amount to two cents and three mills on a dollar, and we now have $12,000 in the treasury. We have over $5,000,000 worth of property insured against fire or lightning. We have no bills to pay for advertising; being a benevolent institution we are not taxed as other insurance companies are; no salaries except the treasurer, who gets $25 a year; no costly insurance offices; the directors have $1 for taking risks; the secretary 50 cents for making out the certificate of insurance. Grangers are the better class of farmers, and having a company of their own they are more careful of fire than people in general. If farmers do not hang together they will hang separately, as Franklin said at the time of the formation of our Government.

Vineland, N. J. J. W.

Woman and Home

From Day to Day.

HOSS-HAIR SNAKES.

Sile sez it's so, an' Sile he knows;
  Fer he knows ev'ry thing.
Why Sile he growed th' apple-tree
  Down where us fellers swing!
He sez he 'members jes' ez well,
  More'n twenty year ago
He dug a hole an' put it in,
  An' he jes' *knowed* 'twould grow.

An' Sile sez 'at he knows it's true;
  His gran'pap tol' him so;
He's seen it, too, jes' heaps o' times—
  Onct not long ago.
Th' hoss-hairs must be long an' white
  Ter make th' bestes' ones.
Y'u put 'em in th' bar'l where
  Th' rainin' water runs.

An' shore ez fate, Sile sez it's true,
  Nine days is all it takes
A-soakin' in that bar'l thar
  Ter make them hoss-hairs *snakes!*
Sile sez thar's lots o' crank idees;
  He's hearn folks tell jes' loads;
But two things shore is hoss-hair snakes
  An' gittin' warts from toads.
—Frank Leslie's Popular Monthly.

*

A FRIEND asks us what is gumbo fillet powder, used by Creole cooks in certain soups and stews. It is a powder made from the young leaves of the sassafras, which are dried in a cool, shady place, rubbed to a fine powder, passed through a hair sieve, and then stored away where the powder will keep dry.

*

ONE of the most satisfactory inexpensive covers for the dining table is made from plain art denim in any dark shade. Two breadths are required, which should be seamed together on the sewing machine, and pressed smooth. A deep hem is turned up on the outside, and this may be worked with white rope linen floss, if desired.

*

WE are asked how to pickle corn. We have never seen corn pickled alone, but it is mixed with cabbage as follows: Cut the kernels from 12 large ears of corn, add as much chopped cabbage as there is cut corn, one large sweet pepper freed from seeds and chopped, one cupful of brown sugar, two tablespoonfuls of salt, one-half tablespoonful of ground mustard and one quart of vinegar. Bring all to a boil and then can.

*

WE often hear of fathers whose experience, after educating their sons, is rather like that of the old man who thus described his troubles:

"It's a queer world when you come to look it over," said the old man. "You know I eddicated Jim fer a lawyer."

"Yes."

"An' Bill fer a preacher."

"Exactly."

"An' Tom fer one of them literary fellers."

"Yes."

"An' Dick fer a doctor."

"Yes."

"Well, now, what do you reckon I'm a doin' of?"

"Can't say."

"Well, sir, you might not believe it, but I'm a-supportin' of Jim an' Bill an' Tom an' Dick, an' it keeps me a-goin' from daylight to dark."

*

MISS Eleanor A. Ormerod, the distinguished English entomologist, botanist and meterologist, died after a short illness July 19. Miss Ormerod began, in 1868, to make a special study of agricultural and horticultural entomology. She was the consulting entomologist of the Royal Agricultural Society, and a member of the Royal Meterological Society. She was one of the highest authorities in her special branch of science, and was the only woman upon whom the University of Edinburgh has ever bestowed the honorary degree of LL.D. Miss Ormerod devoted herself to entomology from pure love of science, and it is gratifying to note that full recognition of her talents was given during her lifetime.

THE most comfortable collar to wear with a shirt waist is the stock tie, made from a strip of white nainsook or dimity, 1½ yard long and four inches wide. The center should be rounded slightly, using a good collar opening at the back for pattern, this being for the purpose of fitting at the front of the neck. With a bias strip of colored lawn one inch wide bind the entire tie, sewing one edge of the strip to the edge of tie, folding it in the center, and stitching down the other edge over the first seam. Bindings of light blue, rose

3860 Seven Gored Skirt, 22 to 32 waist.

or black are very pretty. These ties are worn without any other collar, being put around the neck, crossed in the back, and tied in the front with either a butterfly bow or four-in-hand. The crush stocks are made of two thicknesses of white piqué, stitched along the edges, with the addition of a colored tie, either a small bow or four-in-hand, but very often the crush stock is so very crushy in effect as to look distinctly untidy. The misguided men who have taken to crush stocks this Summer, as a correct finish to their shirt waists are a solemn warning against them. The first of these seen were plain white piqué stocks encircled by a colored tie, and were quite unobjectionable, though it was evident that many of the wearers had not acquired the art of pinning them down securely in the back. These were followed by large stock ties of colored cheviot or madras, which are crossed in the back, the ends being brought forward to form a large Ascot. The thick swathing of colored material, rising above a man's coat, is not attractive, and it brings back visions of the worsted comforter which the old-fashioned boy used to wind about his neck in wintry weather. On the whole, we think the Summer man would do well to stick to collars.

The Rural Patterns.

The seven-gored skirt has certain distinct advantages over every other skirt. Its numerous seams provide vertical lines that give an effect of height. It is fitted without hip darts. Withal it is economical, as it requires less material than the models which include wider gores. The excellent model shown is cut on the latest lines and has the advantage of including the popular band flounce, that can be used or omitted as desired. As illustrated, the material is light-weight cheviot, in soft tan color, but any wool or silk material is appropriate, as the narrow gores lend themselves to narrow fabrics with singular effect. The skirt fits with perfect smoothness over the hips, and is laid in an inverted pleat at the back, but widens toward the bottom. To cut this skirt for a woman of medium size, 9¼ yards of material 21 inches wide, 5½ yards 27 inches wide, 5¼ yards 32 inches wide, or 5 yards 44 inches wide, will be required without the flounce; 12¾ yards 21 inches wide, 8⅜ yards 27 inches wide, 8¼ yards 32 inches wide, or 6⅝ yards 44 inches wide, when the flounce is used. The pattern No. 3860 is cut in sizes for a 22, 24, 26, 28, 30 and 32-inch waist measure; price 10 cents from this office.

The simple sailor waist, with contrasting shield and stock, is a marked favorite of the season, and possesses the merit of suiting many styles and materials. As shown, it is of ox blood mercerized chambray, with stitched bands of a darker shade, collar and shield of white all-over tucked lawn, and is designed for wear with odd skirts; but the model is admirable for the popular shirt waist suits of chambray, linen and the like, and all shirting materials are suitable for the separate waist. The back is smooth across the shoulders and is drawn down in gathers at the waist line. The fronts are plain at the upper portion, but full at the waist, where they blouse slightly, and the neck is finished with the sailor collar that terminates in points. The shield of white is joined to the stock, then stitched to the right front, beneath the collar, and hooked or buttoned into place on the left. A sailor knot of the material adds a finishing touch. The sleeves are in bishop style with straight cuffs. To make this waist for a woman of medium size, four yards of material 21 inches wide, 3¼ yards 27 inches wide, 2⅝ yards 32 inches wide, or two yards 44 inches wide will be required. The pattern No. 3872 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure; price 10 cents.

Fruit Juices.

At this season, when fruit is cheap and plenty, it seems a pity that more country housekeepers do not realize the value of fruit juices. In the average rural kitchen there is wasted every year the finest part of the fruit from lack of time or knowledge of the value of the delicious juices left from canning. Many and many a time have I seen busy women who pride themselves on being economical throw away quarts of juice, all unconscious of the wastefulness of it. Never throw away a bottle large or small, but as soon as the medicine or extract is all gone, carefully clean and store in a dry place in the pantry, where they can be made ready by a few minutes' soaking in hot water for the syrup. Of course no one would think of using bottles that had held poison or dangerous strong medicines, but only those that have held harmless liquids.

3872 Shirt Waist, 32 to 40 bust.

It takes only a minute or two after the cans are filled to strain the surplus juice through a jelly bag and put it back in the kettle with about half its weight in sugar. Tastes differ, and only practice will teach you how sweet or sour your family like the syrup, though half the weight in sugar is a good safe rule. Boil down about one-third, fill the bottles, and seal the small cavity after the cork is pushed well down with paraffin. When paraffin comes more generally into use as a sealing wax, the burdens of the housekeeper will be lightened very much. It is cheap, clean and convenient, can be used again and again, and effectually keeps out the air.

The uses of these homemade fruit syrups are so many and varied that it seems impossible to name them. Three or four tablespoonfuls of it added to pudding sauce flavors and enriches it as no extract can, or the plain syrup is often used for sauce for almost every kind of pudding. In making ice cream it is invaluable, and does away with the danger of poisonous adulterated extracts. One large cupful strawberry, grape, currant, cherry or blackberry juice added to a gallon of ice cream gives it a delicious flavor and delicate color. Compare ice cream made in this way with that colored with drug-store coloring and see whether you do not prefer the former for your children. In hot weather one of the best drinks, as well as one of the wholesomest, is made by adding one tablespoonful of fruit syrup to ordinary lemonade, omitting the sugar. The best way is to fill the glasses and then add the spoonful of juice to each tumbler, stirring well. The same amount of juice added to pure cold, not ice, water is delicious, and is liked by many better than if the lemon is used.

No family where there are little children can afford to be without blackberry syrup during the Summer months, and even the older people will find it helpful in cases of cholera morbus. Its prompt use will check Summer complaint and it will be relished by the little ones when medicine is despised. Pure grape juice is also of great medicinal value and is strictly temperance because not fermented. These are but a few ways in which the syrups may be used, and every housekeeper could find dozens more if her pantry shelves held a good supply of the clear bright juices. In sickness a few spoonfuls of whipped cream flavored with fruit juice will tempt the invalid, and help win back the fickle appetite better than anything else.

The sour fruits make the best syrup, though any kind may be used with satisfactory results. Small inferior fruits, especially berries, may be profitably cooked and strained to obtain the juice, but be sure that it is perfectly ripe and sound. In making quince syrup, which has a very fine flavor, use half sour apples, and a better quality of juice will be obtained. It is a good plan to have a large stone jar that can stand out of the way on the back part of the stove or in the oven, as slow boiling is better than rapid. If you are sceptical as to the merits of fruit juices try a few bottles at least and see whether next year does not find you planning for a large supply. HILDA RICHMOND.

OUR lives hold quite as much romance as is good for us. Sometimes more.—Kipling.

Stackpole's Stump Fence.

"I don't see but what you will have to submit, Cyrus," said Colonel Bowker. "The law seems to be pretty clear on the subject. When the State grants a railroad a charter and a town grants it the right of way the railroad company can take, at a fair appraised value, any property lying in the line of its survey, provided the owner refuses to sell at an agreed price. That covers the facts in this case. You refuse to sell the company a strip on the south side of your orchard. The State says to the company, 'We give you the right to appropriate that land at our appraisal.' It's no use for the owner to protest. The law can do nothing for him. If there was a ghost of a chance to fight, Cyrus, I'd be glad to do what I could for you. But a lawyer can't do anything when there's no law on his side."

Colonel Bowker tipped his chair back and threw one leg over the corner of his littered table. An old man, trembling with impotent rage, sat in a rickety armchair on the other side of the table. His chin quivered and his thin lips kept opening and shutting as the senior village lawyer spoke.

"Then, ef the law can't do anything for me, I'll do it for myself!" cried the old man, bringing his withered fist down on the arm of the chair. "I'll see ef a man kin be robbed of what's be'n his'n for 50 year, and be'n in the family for more'n a hundred!"

"I hope you won't do anything rash, Cyrus," said the Colonel, blandly. "It's a case where the welfare of the many overrides the welfare of the individual, you see. The law provides no recourse for the individual in such a case."

"I got done with the law, I tell ye!" shouted the old man, fiercely. "I'm dependin' on myself now. I said, ef the law couldn't help me, I'd help myself. I'll see ef they kin run their consarned trains through my orchard without my permission. A man's proputty's his own. Th' ain't no law that kin knock that fact out o' the Ten Commandments."

Colonel Bowker accompanied his irate client to the door. "Better be cautious, Cyrus," he said, as the old man plunged down the steps. "Don't do anything in a hurry. Take time to think it over. And remember that I am always ready to advise you on any point that may come up."

Cyrus Stackpole drove home in a blind rage. He was one of those old men who are as set as the everlasting hills, and the fact that everything seemed to be arrayed against his will in this instance only served to make his resolve the stronger. He was bound and determined that the new railroad should not pass through his orchard. There was no particular reason why it should be denied this right of way, except that Cyrus had taken a notion not to allow it. The trees in the orchard had been set out by his father's father, and their knotted and wrinkled trunks and limbs had long since passed the age of fruit bearing. They only served to cumber the ground. But Cyrus would not cut them down and plant new ones. They were a part of the old order of things, and Cyrus was a conservative of the conservatives. A peck of bitter, worm-eaten windfalls from the old trees was more to his liking than a bushel of sound and toothsome fruit from a younger and more vigorous stock. That the pert modern railroad should desecrate his venerable orchard was not to be endured. It went against the old man's grain, and that grain was exceedingly tough.

As it happened, however, Cyrus Stackpole fell into the clutches of a severe attack of inflammatory rheumatism soon after his visit to Colonel Bowker's law office and about the time when the railroad men came to grade and prepare the roadbed across his orchard. The work was all done while the old man was groaning and fuming in bed; and by the time he got about again the ties and rails were laid through his orchard. Then the first train came along roaring triumphantly, and vomiting black smoke over what remained of the ancient apple trees.

Upon this Cyrus bestirred himself, though physical exertion still sent excruciating pains through his joints. The regular passenger train schedule had been in operation just a day, when he began to do for himself what the law could not, or would not, do for him. At 3 o'clock on a Tuesday afternoon, his wife having driven to the village, Cyrus hitched up a yoke of oxen and began to drag stumps from the stump fence on the north side of the orchard to the railroad bed. He chose the largest and soundest and toughest stumps he could find, and by 6 o'clock had a formidable fence built across the railroad on the exact boundary of his orchard. The roots of the stumps bristled in the direction from which the next train would approach—the train from Wilmington—due to pass at 8 o'clock in the evening. Should the locomotive strike those formidable roots the butt of the stump would only be driven firmer into the ground. Something would have to stop, or smash, and Cyrus felt confident that it would not be the stump.

It was several minutes past 6 when the horn blew for supper. Cyrus was glad of the extra time and glad that his field of operations was hidden from the house by a rise of land. When he came slowly up from the orchard with the tired oxen his wife met him at the back door.

"Here's a letter for you," she said. "Supper's a little mite late, but the old mare limps so I couldn't git home as soon as I planned. Better read the letter 'fore ye set down to eat, hadn't ye?"

"No," answered Cyrus, limping to the barn with the oxen. "It'll keep until after I've had a cup o' tea, I reckon."

Cyrus Stackpole ate his supper deliberately and then sank into the old padded rocker by the window and opened his letter. Hardly had he commenced to read it when, with a startling cry, he sprang to his feet again and ran stumbling to the barn. Her husband's cry and sudden leap caused Mrs. Stackpole to drop a lot of plates she was carrying to the sink; but not even the terrific crash of broken crockery elicited the slightest attention from Cyrus. The letter had fluttered from the old man's hand to the floor as he can and Mrs. Stackpole stooped and picked it up with shaking fingers. Something in that letter, she knew, had caused her husband's sudden dismay.

She turned first to the signature. It was from Frank—their own dear boy, from whom they had not heard for two years and whom they had about given up for dead since he disappeared in the Alaskan gold fields.

"Dear Father and Mother," he wrote, "I am coming home at last—a rich man! Have been out of the world, practically, since I wrote you last—living in a hut, 200 miles beyond civilization. Will tell you all when I see you. Look for me next Tuesday evening. I learn that you have a new railroad now and I can reach you by train the same evening I get to Wilmington, God bless you both! Lovingly, FRANK."

What was there in that blessed letter that could have caused her husband such distress? Mrs. Stackpole wiped the tears of joy rfom her eyes and sped out to the barn.

"Cyrus!" she cried. "What on airth air you doing?"

Cyrus was hurriedly replacing the yoke on the necks of the weary oxen. His hands trembled. His face was overspread with an ashen gray pallor.

"Git out of the way!" he shouted, as he lashed the oxen from the barn, the long chain that dangled from the yoke clattering behind. He caught a lantern from a nail and hurried after the startled and bewildered beasts.

"Where *air* you going, Cyrus?" demanded his wife, following the distracted old man, as he led the oxen over the crest of the hill to the orchard bars. Cyrus made no reply, and his wife followed him. Then she saw the bristling stump fence across the railroad, and the whole dreadful truth flashed upon her. Cyrus had built a fence to stop or wreck the next train, and that was the very train that Frank had written he should take from Wilmington!

The village station was a mile beyond the Stackpole farm. The train would not have even begun to slow down when it passed through the orchard. It was already getting dusk. It would be pitch dark by the time the train came along—in just an hour.

Cyrus Stackpole never looked at his wife, but worked with feverish haste; and she did not interrupt him, for she knew that every moment was precious. The oxen strained mightily at the great stumps, but they were so crowded together and interlocked that it was hard to get them off the track. Cyrus had performed his defiant task unfortunately well.

"Light the lantern!" cried the panting old man at last. His wife took the match he flung her and kindled the slight flame in the dusty globe. Cyrus bent and adjusted the chain anew by the candle's feeble light. Then the oxen strained together once more, but the biggest stump of all would not move. The long, tough roots were wedged between and under the rails.

"God!" groaned the old man. It was the shortest of prayers, but it was a prayer and not an impreeation.

"Hark!" cried the trembling old wife. From far off through the darkness came a faint rumbling sound. It was the evening train from Wilmington!

"Cyrus!" exclaimed the woman. "Red light'll stop 'em—I've heard so. Hain't we got anything to make a red light with? Quick!"

Cyrus disgorged the contents of all his pockets at one sweep. Among them was an old-fashioned red bandanna handkerchief. His wife seized it with a cry of joy, and, catching up the lantern, hastened down the track toward the approaching train. She turned up the wick of the lantern until it smoked furiously. Then she wrapped the red handkerchief around the globe held the lantern up in both hands and slowly swayed it to and fro.

The train was almost upon her before the engineer saw the faint red signal. But the air-brakes did their magic work, and the engine stopped within 20 feet of the last huge bristling stump of Cyrus Stackpole's fence across the railroad. Frank Stackpole was one of the first passengers to leap from the intercepted train.

"What in thunder—why! Father's old orchard!" he exclaimed. "And here—mother!" He caught a tottering gray-haired figure in his strong arms. Mrs. Stackpole like all heroines, had first accomplished her deed, and then fainted away!

The railroad company did not enter a complaint against Cyrus Stackpole. His big, black-haired, healthy son may have had something to do with that, and he may not. Very likely, the unrestricted and undisputed right of way through the old man's orchard was an inducement. At any rate, the matter was dropped, and Cyrus Stackpole proved to be so subdued in spirit that, only two days after his stump fence disappeared from the track, he rode through his own orchard on one of the detested trains, on his way to Wilmington with his son, to buy a brand-new suit of clothes and "see the sights."—James Buckham, in the New York Evening Post.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Kitchen Mathematics.

In following recipes "an egg" or "a cupful" are terms used easily, without thinking that the size of eggs and of cups differs. The Chef, of Chicago, gives this valuable table of weights:

Ten common-sized eggs weigh one pound.

Soft butter, the size of an egg, weighs one ounce.

One pint of coffee and sugar weighs 12 ounces.

One quart of sifted flour (well heaped) weighs one pound.

One pint of best brown sugar weighs 12 ounces.

Two teacupfuls (well heaped) of coffee and sugar weigh one pound.

Two teacupfuls (level) of granulated sugar weigh one pound.

Two teacupfuls soft butter (well packed) weigh one pound.

One and one-third pints of powdered sugar weigh one pound.

Two tablespoonfuls of powdered sugar or flour weigh one ounce.

One tablespoonful (well rounded) of soft butter weighs one ounce.

One pint (heaped) of granulated sugar weighs 14 ounces.

Four teaspoonfuls are equal to one tablespoonful.

Two and one-half teacupfuls (level) of the best brown sugar weigh one pound.

Two and three-fourths teacupfuls (level) of powdered sugar weigh one pound.

One tablespoonful (well heaped) of granulated or best brown sugar equals one ounce.

One generous pint of liquid, or one pint of finely chopped meat, packed solidly, weighs one pound.

No More Spoiled Fruit.

Canning made easy and sure by using my Standard Patent Self-Melting, Self-Sealing Wax Strings. Very economical and easy to apply. Valuable fruit information, and 100 Strings by mail, for 45 cents in stamps. C. C. FOUTZ, Middletown, Ohio.

BUSINESS BITS.

EVERYBODY likes strawberries and more families would have a nice bed of them if they only knew how easily they are grown. Any ground that will grow corn or potatoes will do. Write Henry A. Dreer, Philadelphia, Pa., about potted plants.

THE white form of the moccasin flower or lady-slipper orchid, Cypripedium spectabile, is as beautiful as it is rare, and makes a splendid companion with the purple flowered type. Harlan P. Kelsey, Tremont Building, Boston, Mass., has worked up a fine stock of this most desirable hardy plant, and offers them for Fall shipment.

FARMERS interested in making good roads, and in giving comfort to workmen and teams, should note the valuable improvement in the metal wheels manufactured by the Havana Metal Wheel Co., Havana, Ill. It is a patented grooved tire for metal wheels, and they make the wheels to fit any sized skein. This groove protects the ends of the spokes from wear and guards against ever wearing out. They make also a complete farm truck wagon, besides 10 styles of other truck wagons. It will pay our readers to write them for circulars of their full line, including feed grinders, shoveling-boards, steel wheelbarrows, etc.

ALFALFA ON MUCK.—As an experiment this Spring five acres of muck were seeded to Alfalfa. For a long time it seemed a question as to whether it was a success or a failure, as it rained and repeated so often that the soil was afloat most of the time, but as soon as the weather began to warm up and the sun did a few days' work the Alfalfa began to "look up," so to speak, and we soon harvested eight tons of good feed. I am somewhat skeptical as to the wintering of the roots, but am of the opinion, and decidedly so, that it will more than pay for a Spring crop each season, and let it winterkill if it wishes. Time will tell. W. E. IMES.

Michigan.

Notes on the Season.

Picked our sweet corn July 25. First string beans July 2—a little young, but as we had planted freely and expected a long yield we wished to begin early. A dry spell following, the rest (several varieties), became leathery in a day or two; as cherry picking and haying were upon us we could not stop to lug water. First peas July 2. All the rest, mostly wrinkled varieties, too hard in a few days. Beets ready for bunching, July 20. No locally-grown early potatoes to be had July 25; promise of average crop. Bugs gone and no blight. Late potatoes looking well. Our soil is clay and packs quickly, and is not early. New potatoes, southern grown, are being reshipped daily from this point to surrounding villages, and prices have advanced greatly. One year, by propagation under glass from top cuttings, we succeeded in getting some ripe tomatoes June 25. This year we grew the plants in pots till they were in blossom, and planted in rich hills without breaking sods, but it now looks as though we would not get a ripe tomato before the middle of August. Our Dahlia garden, owing to the moist Spring, began to bloom about July 4, but needs moisture now properly to develop the flowers. We had good hay weather, and the barns are full of fine hay.

Columbia Co., N. Y. J. Y. P.

I TELL you the meadows about here this year all looked as though we had followed Mr. Clark's methods of grass culture. In all my experience as a farmer I think I never cut such big grass, and so few weeds mixed in it. It makes a fellow have a sort of a comfortable feeling when he thinks about feeding his stock next Winter and Spring. A. R. P.

Ohio.

LICE ON APPLE TREES.—I see you recommend spraying for lice on apple trees; I tried that without much effect, as the curled leaf protected so many of them. I told my trouble to C. B. Wood (the venerable and successful fruit grower of Rappahannock County). He told me to try dipping the affected twigs in a bucket partly filled with tobacco water. I did so, and found it very satisfactory indeed.

Barboursville, Va. A. R. L.

A FARMER'S PICNIC.—The joint picnic of the Niagara and Orleans Farmers' Clubs at Wilson, N. Y., on July 27 was a great success. From early in the morning the roads were black with carriages, and the trains brought hundreds of people from distant points. It is impossible to make a fair estimate of the size of such a crowd, scattered as it was over a large field, but there seemed to be at least 12,000 persons present. They were all interested in farming in one way or another, and seldom can one find such a clean-looking, prosperous, happy and keen body of people. There were thousands of lunch baskets to be emptied, baseball and other sports for those who enjoy them, and speaking for those who prefer that form of entertainment. Speeches were made by H. W. Collingwood and Prof. Mills, of the Guelph (Ontario) Agricultural College. The picnic was a great success in every way. The farmers of western New York are alive. They know how to get together for business. They do not stay apart and grumble about their wrongs, but they get together and learn from one another what is wrong. Farmers seem to be generally cheerful this year, though the apple crop is short, while wheat is nearly a failure. Corn is backward. It was quite surprising to a Jerseyman with a farm as wet as a sponge from the constant rains to find such a dry country, where crops were dying from thirst.

"Stick to the bridge that carries you safe over." For more than sixty-two years Dr. D. Jayne's Expectorant has done that for thousands of sufferers from Lung and Throat troubles.—*Adv.*

My Handkerchief Garden.
Memory Training.
Accidents and Emergencies.
Canning and Preserving.

MARKET NOTES

NEW BRAND OF STRIKE.—The fruit commission merchants of San Francisco have had trouble on their hands in the shape of a strike of the teamsters handling their produce. About 800 wagon drivers quit work, and the wharves and sidewalks in front of the stores soon were piled high with fruits and vegetables. Some of the merchants and their clerks got out and drove their own teams, relieving the situation a little, but a large quantity of stuff spoiled because it could not be handled, and had to be thrown away.

BROOM CORN MATTERS.—The corn trust has obtained control of the market to such an extent that they can again absolutely dictate prices. Several weeks ago they reduced the price to such an extent that growers who were holding sold out at a low figure, and, of course, the trust quickly took all that was offered. Owing to the drought in the West, it is estimated that the shortage in the 1901 crop will be 20,000 tons, and it is not improbable that the price will go up to $200 per ton before the season closes.

DROUGHT AND LIVE STOCK.—When weather conditions in the cattle districts are such that food and water become scarce, the markets immediately feel the effects in increased receipts of live stock, for cattle men have no resort except to sell the stock that they cannot take care of. This is quite a reliable test, almost like a thermometer, for the worse the conditions the more animals are shipped. On July 10 the receipts at the Chicago cattle yards exceeded all previous records. Kansas City, however, being so much nearer the district where the drought was worst, received many more cattle proportionately than Chicago. The following figures show the amount of live stock received at Chicago, Kansas City, Omaha and St. Louis for the month ending July 20: Cattle, 510,000; hogs, 1,204,600; sheep, 466,100.

FRUIT NOTES.—Large quantities of excellent peaches are arriving. Prices at present are 25 cents per carrier above last year. The highest figure given is $1.75, but now and then an extra choice lot sells at a premium. Pears of fair size, but miserable quality, are plentiful. I saw a peddler with a wagon-load of this worthless fruit which he was selling for five cents a quart as "choice Bartletts." Doubtless he found enough people who did not know the difference to take all that he had. There is a fair supply of early apples, though but few good ones are seen. Most of them are small, and it is a wonder why they sell at all while there are so many peaches and other high-quality fruits to be had. A Summer apple at its best is but a poor substitute for its Winter relative. Watermelons are selling moderately well; also muskmelons, when of reasonably fair quality. However, there has been and is now a big surplus of muskmelons that are not good for anything, and everyone of this sort that is sold is an injury to the trade. The only way to keep the market for this product in fair shape is to ship only good fruit, and get it to the consumer as quickly as possible.

PRODUCE FOR THE WEST.—One effect of the unusually hot weather in the West is seen in the great call for vegetables and fruits, particularly lemons. It is said that during the past 15 days Philadelphia has sent over 100 cars of produce to western points, one concern having shipped 10 cars of lemons during the last week. Similar reports come from Baltimore, from which large quantities of potatoes, cabbage and tomatoes have been shipped. Cabbage in Baltimore has advanced 25 cents per crate, and potatoes 75 cents to $1 a barrel. The indications are that the potato crop in many States is light, and that higher prices than last year will prevail. However, a short crop does not necessarily cause extravagant prices, as the bulk of the potato consumers substitute something else, buying fewer potatoes when prices get above a certain limit. The hot weather has also caused a big boom in ice in Chicago. The chief call has come from southern cities, where the capacity of the artificial ice plants was not sufficient to supply the increased demand. W. W. H.

SOUTHERN CANNING FACTORIES.

CANNERIES AND COTTON GINS.—Canned goods go with civilization. They sustain great armies on their march across deserts and over distant islands of the seas. Tin cans mark the farthest adventures of man towards the North Pole. They may also be found "upon the bosom of the mighty deep." Canned goods may tide a nation over a distressing famine. They are not only indispensable in great emergencies, but we find them a most valuable luxury in our every-day life. The tin can brings to our tables, every month in the year, the fine fruits and vegetables of Spring and the harvest season. When one part of a country suffers from a loss of these excellent things, due to drought, insects or other calamities. the tin can brings them in abundance from more favored sections. When a State or nation begins to make much progress in industrial development, canning factories must follow. They are coming rapidly in Texas. Wherever there is a canning factory it develops horticultural industries. It saves the loss in horticultural crops. When the price of products in the markets goes below the cost of production, the factory comes in to great advantage, and saves the crop at a profit. It gives employment to men who might otherwise be idle. It keeps the money in the town that would go out for canned goods. Instead of the boiler and house of cotton gins lying idle all the year, except during the cotton season, small canneries could be connected with them and be used during the canning season to advantage. This would greatly encourage diversified farming in cotton communities. There would not be so much fear of cotton insects, such as the boll weevil.

COST OF SMALL CANNERIES.—The boiler and house are two of the most costly items in canning outfits. These things are already found at the cotton gins. Hence, what I shall say about cost does not include the cost of the boiler and house. A cannery for 500 cans per day will cost about $150; and will employ about five hands; for 2,000 cans per day, the cost will be about $250, and will employ about 20 hands; for 5,000 cans per day, the cost will be about $600. Our small cannery cost us as completed now nearly $400. While the capacity is estimated at 5,000 cans per day, we have never tested it at its full extent. We could easily add more machinery and increase its capacity at any time. Of course, wherever good fresh water is not found it will cost something to get it. A great deal of water is needed at a canning factory, and while almost any kind can be used for washing and processing, pure water must be used to go inside of the cans.

CANNING.—Nearly all firms that sell canning machinery give full instructions for canning that go with the machinery. However, we find that we cannot follow entirely, the recommendations for canning in the North. Our products vary in sugar, water, starch and acid content, and our Summers are longer and hotter than they are in the North. Consequently, we have to process longer here. Some southern factories have had much loss by following closely instructions for the North. Then, again, some southern factories do not possess some secrets used by factories of the North. They have had trouble in putting up a white grade of corn that would compete in the markets with the northern product, though the flavor was fully as good. Sometimes salicylic acid and cream of tartar have been used to bleach the corn. Recently we have tested a method of cooling the cans in water just after processing, and have found that this method greatly improves the color and flavor of corn by stopping the cooking suddenly. It improves fruits very much in the same way. The products must be kept fresh, and be put into the cans and processed before they are discolored. This is one of the main secrets. Sometimes we hear complaints of canned goods injuring those who eat them. In nearly all cases this is due to the products having soured before they are canned up. There is no harm that can result in using canned goods that are put up in a fresh condition, and do not have any acid in them.

BY-PRODUCTS.—In canning corn and peas there is a great deal of valuable food left in the shucks and cobs of corn and the hulls and vines of peas. These materials make valuable food for stock. At Greenwood, Ind., they have been put into the silo as they came from the cannery, and they made excellent silage. The fodder from sweet corn makes excellent forage. We have found that the peach peeling makes a most excellent jelly. A large amount of coloring matter and sugar are found in the peach peeling. When the peaches are peeled by hand we have found that the peelings from one bushel of peaches make three quarts of fine jelly. It takes about 25 cents worth of sugar and five cents worth of vinegar to make this amount. These three quarts of jelly are worth about 90 cents. The peach stones are worth about 75 cents per bushel to the nurseryman. This enables one to see that there is nothing about the peach that should go to waste. Small tomatoes may be made into valuable ketchup. In fact, all the by-products about a canning factory may be used advantageously.

THE PROFITS IN CANNING.—Of course, the profit will depend upon the amount of goods canned, the cost of the raw material, the kind and quality of goods put up, and the business management of the factory. In a general way, I may state that the profits are usually very satisfactory. Last year we put up nearly 9,000 cans, and when these goods were estimated at the prevailing wholesale prices at the time, we found that we had cleared enough to pay for our entire factory, and had left $121 besides. Students, mostly, were employed, and we paid them 12½ cents per hour, which was very high. In nearly all factories, labor is paid for by the piece, which is much more satisfactory. Frequently women and children do the most satisfactory work in the cannery, and this labor usually does not cost so much. In concluding, I will state that I can see no reason why small canning factories cannot be made a success in connection with cotton gins, wherever horticultural crops can be successfully grown. On large cotton farms there is usually a number of people who might be profitably employed in a canning factory. A part of the canned goods might be sold to the laborers for work in the cannery. I am frequently asked whether it is necessary to have an expert to do the processing. I might state that it is not advisable for anyone to start running a factory without some experience. Anyone who has the capacity to learn, and is willing to do so, we can teach in our factory in four weeks. R. H. PRICE.

College Station, Texas.

Mosquitoes and Malaria.

The New York Board of Health is out against the mosquito, and has issued a circular to doctors from which we take the following:

"The organism causing malarial fever (the Plasmodium malariae) is probably a true parasite and, so far as we know at present, finds the conditions necessary for its existence only in the living human body, and in this genus of mosquito, the latter becoming infected by sucking the blood from an infected human being. The malarial organism having thus entered the stomach of the mosquito, passes through certain changes in the body of the infected insect and at the end of about 10 days reaches the poison gland. After this time, if the mosquito bites another human being the malarial organism is introduced into the circulation of the latter, and malarial fever follows. So far as we know certain localities are 'malarious' only because they furnish favorable conditions for breeding this mosquito. Malarial fever would not occur in any malarious district, unless some infected human being were in it, or came into it and infected the mosquitoes, which in turn infected other human beings."

The following sensible suggestions are made to city people:

"First, proper screening of the house to prevent the entrance of the mosquitoes, and screening of the bed at night. The chief danger of infection is at night, inasmuch as the Anopheles bite mostly at this time.

"Second, the confinement and continuous screening of persons in malarial districts who are suffering from malarial fever, so that mosquitoes may not bite them and thus become infected.

"Third, the administration of quinine in full doses to malarial patients to destroy the malarial organisms in the blood, and persistence in the use of the remedy even for a few weeks after apparent recovery.

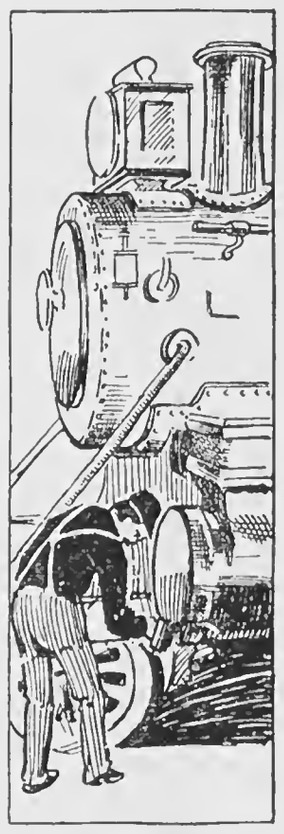
"Fourth, the removal of the breeding places of the mosquitoes through drainage, filling up of holes and surface pools, and emptying of tubs, pails, etc., which contain stagnant water. These mosquitoes particularly breed in surface rain pools and surface stagnant water, where there are no fish; also exceptionally in pails, tubs, barrels and tanks of standing water, though they seem mostly to prefer natural accumulations.

"Fifth, in pools which cannot be drained or filled the destruction of the mosquito larvæ by the use of petroleum thrown upon the surface, by the introduction of minnows and other small fish which eat the larvæ, or by both methods."

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

"Oiling Up."

Just a little oil on the engine at the right time may mean the difference between life and death to the passengers and crew. What oil is to the friction of the delicate parts of the engine, Dr. Pierce's Golden Medical Discovery is to the delicate organs of the body. It eases their labor, prevents the loss of power and waste of energy caused by friction. Many a man who was all run down, whose limbs ached when he walked, whose back ached when he laid down, who breathed with difficulty, and coughed constantly, has been perfectly cured by the use of Doctor Pierce's Golden Medical Discovery. It purifies the blood, strengthens the stomach and heals weak lungs.



Accept no substitute for "Golden Medical Discovery," nor any medicine called "just as good" by the dealer.

Mr. Chas. Hunwick, of Lenox, Macomb Co., Mich., writes: "I have never felt better in my life than I do now. I have taken Dr. Pierce's Golden Medical Discovery right along. I can now walk quite well with a cane, and hope to throw even that away before long, and as I have had to use crutches for nearly two years, I think I am doing fine. I do not cough now and I can sleep like a school boy. You must know that I have been treated in two hospitals and by three doctors besides, and received no benefit; so I think your medicine the only medicine for me."

Dr. Pierce's Medical Adviser in paper cover, is sent free on receipt of 21 one-cent stamps to pay expense of mailing *only*. Address Dr. R. V Pierce, Buffalo, N. Y.

Live Stock and Dairy

RAISING DAIRY CALVES IN WINTER.

Everyone concedes that the manner in which a calf is raised, whether it be a bull or heifer, has much to do with its value when it reaches maturity. A calf that is tied in a dark corner of a dark stable, allowed little or no exercise, fed irregularly and without care, cannot be expected to develop into the kind of cow we want in our barns. And, as a matter of fact, calves so treated, or rather maltreated, seldom if ever prove satisfactory either as milkers or sires. While all are agreed upon this, not all raise their calves after the same method, there being almost as many ways of feeding and caring for them, as there are farmers who do it. The writer does not claim that the method outlined below is the only way to raise calves successfully, or even that it is the best way, but that it has some merit is evidenced by the fact that we have been uniformly successful when employing it.

We like to start the calves some time during early Winter, so that they may pass the first few months in the barn. At this season we have more time to attend to them; they are not annoyed by flies, and seem to do much better than when started in the Spring. The calf is taken from its dam as soon after birth as possible, and put into a pen in a separate building. Calves thus removed before they have become well acquainted with their mothers are very readily taught to drink. They usually accept milk the first time it is offered, but sometimes one will be obstinate, in which case a 12-hour period of fasting and meditation usually brings about the desired result. For the first week we feed whole milk twice a day, from three pints to two quarts at a time. Some small calves are fed three times during the day, but the total quantity of milk is not increased. At the beginning of the second week half skim-milk is substituted for half of the whole milk. At the same time one-half tablespoonful of linseed meal is scalded and added to the milk for each calf. The oil meal is fed as long as the calf receives milk, the amount being gradually increased until each calf receives one-half pound daily. The proportion of skim-milk to the whole milk is gradually increased until at the end of from a week to 10 days the transition has been completed. We did not have a calf scour or get off its feed last Winter. At any time before the calf is 10 days old it is well to kill the embryo horns by applying caustic potash. This has been so often advised and described in the agricultural press that it seems hardly necessary to repeat the directions here. It is very simple, and seems to us much better than to let the horn grow, only to cut it off with a pair of clippers.

Until three months of age our calves have the run of a large basement, and here they grow and develop as calves kept tied up, or in small pens, do not. Now they are stanchioned the same as the cows and on pleasant days they have the run of a yard and large shed. We believe plenty of exercise to be an important factor in raising healthy calves. From the first, hay is kept before them, and in a short time they learn to eat a good deal of it. Bran is also fed as soon as they can be induced to eat it. Now, with the addition of milk, they are being fed much as are the cows, silage and bran night and morning, hay at noon. It is astonishing what an amount of silage and hay they eat, and what big stomachs they are developing. Some of the essentials to success in raising calves for the dairy it seems to me may be stated in the following order: Regular and careful feeding, being careful not to overfeed at any time, changing gradually from whole to skim-milk, keeping pails and troughs clean at all times; allowing them plenty of exercise and sunlight, and, in addition to the milk and grain, inducing them to eat plenty of coarse forage.

Connecticut. R. W. R.

SKIM-MILK CALVES FOR BEEF.

Prof. H. M. Cottrell, of the Kansas Experiment Station, is doing very practical work with dairy and beef cattle. Kansas feeders have thought that the average skim-milk calf will not make good gains when fed for beef. The calf that has run with the cow often sells for so much more than the skim-milk that there is more in calf suckling than in dairying. To settle this matter the Kansas Experiment Station fed 10 calves that had been hand-raised on skim-milk against 10 that had run with their dams at pasture. The result was that the skim-milk calves made an average gain of 440 pounds, while the sucklings gained 435, and consumed more hay and grain per 100 pounds of gain. Prof. Cottrell says:

We attribute the good showing made by the skim-milk calves to the fact that at weaning time they were already on grain feed; they did not worry at loss of their dams as did the other calves, and they were perfectly tame. The skim-milk calves were fed until weaning on sterilized skim-milk with a grain ration composed of equal parts of corn and Kaffir corn, with all the Alfalfa hay they would eat. They were fed in this way 22 weeks, and made an average daily gain of 1½ pound per calf. The feed to raise these calves to weaning cost $5.27 per head. As the results show, they were in good condition for feeding when weaned, and the experiment shows strongly the good feeding qualities of the skim-milk calf and the profits that can be made from it, when the calf is properly handled from birth to weaning and then pushed for baby beef. The College herd of scrub cows, bought without regard to their value for the dairy, produced in a year, at creamery prices, milk worth $37.75 per cow. The skim-milk calves which were fattened in this experiment were of mixed breeding, and were selected without regard to their value for the production of baby beef. They brought an average of $40 each when marketed at about a year old. This shows a gross income in a year from a scrub cow and a scrub calf of $77.75, when both cow and calf are pushed, the cow's milk sold, and the calf raised on skim-milk.

How Koumiss is Made.

Will you inform me how koumiss is made? I have stomach trouble and have to diet, and I thought I would try that.

South Colton, N. Y. O. H.

Koumiss was first prepared by a very old Asiatic tribe, the Kumanen, from whom it no doubt takes its name. This tribe was mentioned by Xenophon and Pliny. The Kumanen made koumiss from mare's milk, and in Russia and Asia this practice is still followed, but in this country skimmed cow's milk, to which sugar has been added, is usually used. Koumiss differs from buttermilk in having undergone alcoholic fermentation, from one to 1½ per cent of alcohol being found by the chemist in that made from cow's milk. The dietetic value of koumiss seems to be due not to the alcohol which it contains, however, but to the peptonized condition of the casein, which is thus more easily digested. The casein is in the form of a very fine floating curd.

To make koumiss take 25 pounds separator skim-milk, 10 pounds water, seven ounces granulated sugar, three ounces milk sugar and about 1½ ounce good yeast. Stir all together thoroughly and allow it to stand at a temperature of 100 degrees Fahrenheit for about 30 hours, stirring meantime at intervals of five hours. At the end of this time decant carefully into bottles, cork or stopper securely, and put into a cellar at a temperature of 55 degrees. It sours rather quickly, hence should be used within six days after making. J. A. F.

Gray Head Lice and Poultry.

The article on incubator chicks on page 366 contains some good advice, and some I disapprove of. Near the bottom of the page is a reference to the large gray louse I consider incorrect. P. H. Jacobs had gray louse on the brain years ago, but he never gave it credit for being a boring machine. I don't believe the large gray louse injures chickens in any way, provided the chick is all right to start with. I have read, raised and studied chicks for 30 years. C. W. KING.

Regarding the work of the gray head louse on ducks, a reliable poultry paper states: "If attacked by the large gray vermin in the head, though appearing well, they will turn over on their backs and die." Another paper made the same statement recently, describing in detail the operation as I gave it in THE R. N.-Y. Sister Mary told me this Spring that her little ducks mothered by hens at the Gabriel's Hennery, were greatly injured by big gray lice in the head. Personally, I have had no experience with these pests on my ducks, but after reading the articles above referred to, thought perhaps a few cases of sudden and unexplained deaths in my flock were thus accounted for. While Mr. King may be correct in his assertion that my insect is a myth I'm very confident that the leading poultrymen in the country will object to his statement that this pest "does not injure chickens in any way, provided the chicks are all right to start with." Robert H. Essex, of the Reliable Poultry Journal, writes me:

"The fact that P. H. Jacobs had gray louse on the brain years ago, is undoubtedly something in favor of Mr. Jacobs, although not so intended by Mr. King. There are two things that cause the death of the majority of poultry in this country (aside from those killed for market) and those are lice and overfeeding, and it is probable that the former are responsible for the most slaughter. Mr. King's belief that the large gray louse does not injure chickens in any way provided the chicken is all right to start with has no foundation in fact. Where a hen and chicks have range they rid themselves of lice sufficiently to make a very fair show in the struggle for life, but where they are minus the range and cooped in the fancier's yard they certainly must be attended to, or many of the chicks will doubtless go to the 'happy beyond.'"

In view of the experience of our best workers among fowls and their united verdict regarding the injury and mischief of lice it would appear that a little too much care and credulity is safer than too little.

FRANCES ELLEN WHEELER.

Curb, Splint, contracted cord, thrush, grease heel and all forms of lameness yield readily to **Tuttle's Elixir.**

Used and endorsed by Adams Express Co.

Reading Trotting Park, Mass., Aug. 31, 1899.

Dr. S. A. Tuttle, V. S.

Dear Sir:—I want to add my testimonial to your list recommending Tuttle's Elixir for cnrbs, broken tendons, thrush, and nails in the feet. I have used it on all of these cases many times, and never failed to make a cure. J. H. NAY.

Given internally it is sure cure for **Colic, Distemper, Founder, Pneumonia, etc.**

TUTTLE'S FAMILY ELIXIR cures rheumatism, sprains, bruises, etc. Kills pain instantly. Our 100-page book, "Veterinary Experience," **FREE.**

Dr. S. A. TUTTLE, 30 Beverly St., Boston, Mass.

Beware of so-called Elixirs—none genuine but Tuttle's.

Avoid all blisters; they offer only temporary relief if any.

ORR'S FLY KILLER IS THE BEST

Kills Flies and Lice on Cattle and Horses.

Gives Cows Comfort, hence more milk.
Keeps Flies off Horses, hence more work.
Purifies the Stable, hence health and safety
One gallon can $1, and Keystone Sprayer $1, **both sent express prepaid for $2.00,** to introduce it. Five-gallon can, freight prepaid, $4 00.

ORR & COOPER, 563 Liberty St., Pittsburgh, Pa.

THE FULL MILK PAIL

attests the value and is the sure result of the use of our

NEW CENTURY FLY KILLER OIL.

There is no "fly time" where it is used. Absolutely safe—harms neither man nor beast and will not taint milk. It is most evenly and cheaply applied with our **Special Sprayer.** Calves and young stock can't thrive and grow if continually fighting flies. It's equally valuable for horses. Prevents "fly nervousness" and has saved many a "run off" and "smash-up." Ask your dealer for it. If not there, send $1.00 to us for **Sprayer** and enough **Killer** to protect 250 cows or other animals. We are the sole manufacturers **and want agents everywhere.**

FLEMING BROS., Union Stock Yards, Chicago, Ill.

DAIRY AND FARM NOTES.

Labor Problem on the Farm.

LABOR WELL PAID.—The difficulties attending the labor problem account in great measure for the division and subdivision of farms, enabling the owner or occupant to perform, often with the assistance of his family, nearly or quite all of the work, doing away with much perplexity and acquiring at the same time a feeling of independence. I am willing to subscribe to the truth of this statement. I am not willing to indorse it as a necessity. One of the anomalies of American industrial life is the aggregation of interests in manufacture and a division in agriculture. After all, the causes are not deeply hidden. The impetus given to manufacture by a protective tariff gave it an opportunity to pay extravagant wages when compared with the wage schedule of the older countries. I am thankful that labor is well paid. The laboring class, it would seem from their frequent disturbance, do not appreciate it. When a farm laborer without long training or special fitness is able to earn a sack of flour daily it would seem that the purchasing power of a dollar had about reached its limit. The large salaries and immense profits realized by so very few appear to have a demoralizing effect upon the masses. Cheap reading has given the laboring man an equal chance with his more opulent neighbor; an opportunity to know all that occurs from the Gulf to the Great Lakes, and from Gotham to the Golden Gate.

WHY FARMERS FAIL.—Is it true, from careful analysis, that agrieulture has suffered from high wages paid in other industries? I do not think so. The most lavish and reckless buyers of our commodities are these same men, when working daily at a good wage. Then why are we unable fully to meet the competition, and pay wages and employ sufficient labor fully to meet our demands? They are not met, if my observation is correct, on one farm in 100. We are unable to use machinery to the same extent, and thus the producing power of a man on the farm has not kept pace with the shop. Labor is not concentrated in a small area, making a close and careful supervision more difficult, and there is also the opening up of immense tracts of the most fertile land in the Middle and Far West, with its boundless readily available fertility. I am not condemning it, however, because the scheme has made possible our great National wealth, and we are on the eve of a full appreciation of the wisdom of the scheme. The eastern farmer has suffered financially for 20 years and does not take kindly to this broad acceptance. But in the meantime he has found out the boundless mineral plant-food resources of his own farm, which, coupled with increased demand as compared with production will soon plaee him in a position of forgetfulness of the past, and success for the future. A lack of working capital is often a cause of insufficient labor. In a nutshell, which we might as well admit first as last, one lack is ability to make the labor produce a little more than its cost, which I am firmly convinced is one fault and not attributable to Government or general conditions.

LACK OF MANAGEMENT.—This last statement is not a popular one to make; farmers rarely if ever subscribe to it. Building air castles and theorizing will not make a dairy cow profitable, or cheapen and increase crop growth. Still, there lingers in my mind the possibility of application of skill and ability over larger fields and farm enterprises. It has been successfully worked out in cheese and butter making. The return to individual effort in manufaeture and sale would at once result disastrously. Do you not think that among the patrons of a well-managed creamery or milk receiving institution a man with as much skill and experience in stock feeding and handling as the butter maker has in his field of labor would result in immediate profit over cost? Even though high, $50 a month would mean $1 a patron per month, or $12 a year. Don't you think he could earn it, and don't you think that if a man had 25 cows with the conditions found in most dairy sections he could earn through that man more than quadruple his cost, in food combinations, care and breeding? I am sure of it. I would like to be a party to such a scheme, and would willingly take my chances of getting cost out of him. We have a vein of self-sufficiency running through us that presents a mighty barrier to profitable light and knowledge.

WHO SHOULD ADVISE?—Mr. Allerton says a man is not qualified to write who has not been successful. Very well; who is to be the judge? We have had years of experience in handling labor, and if years of service count for anything it has been with some degree of success. If the reader will accept my version of success it seems the cause may be briefly stated.

Preëminently first comes the necessity of keeping men interested in the work. I have never seen a man fail of earning his wages if interested in the work and business of the farm. Some men are much more rapid than others. They are not always the best men. I suppose our Connecticut friend, H. G. M., will criticise this statement as he did a similar one regarding milkers. I must confess it is not a usual occurrence. The effectual labor is the persistent labor, steady, faithful and sufficiently balanced to see a thing or two when at work. He looks carefully that his tools are kept in condition. The simple act of cleaning a shovel or hoe after use is indicative of a careful and interested disposition. There is a certain likeness running through our work; when these acts of interest are shown state your appreciation. Partners cannot work together without reciprocal confidence. The man who performs or aids in doing the labor of the farm is a partner in the business, and with the present scarcity and high cost he becomes a very important part of the business. Counsel with him. The "hired man" may by chance have the best judgment on a piece of work. Many a time I have seen men carry out their own inferior plan simply to show the man their authority. Do you think that this man will subsequently lie awake nights, or in fact, daytime either, thinking about your welfare? Doubtful!

FARMER IS BOSS.—Don't misunderstand me; a farmer who is not capable of previously arranging the system and methods of procedure, who is not master of his business, maintaining his proper dignity towards his men, can never become a profitable employer. It is surprising how quickly men see this fatal wavering in their employer, and then lose confidence in him. I find no difficulty in maintaining this dignity. (I use it for want of a better term) and at the same time meet our farm help on a level. Farm laborers have inalienable rights; they should assert them, and others should respect them. A pure clean atmosphere should be and must be maintained about the farm. Men have greater respect for their employer if he has a good clean Christian character with him six days in a week as well as on the seventh. Near manufacturing establishments, and sometimes far removed from them, men are uneasy and difficult to keep on the farm, on account of longer hours of daily service. I am inclined to think in our own locality more frequently this fault is found than any other, and I am not sure but it is well taken. The old established custom in the earlier days was from sun to sun during the Spring, Summer and Fall months. Men now grow weary of these long days, and search out employment where they know when their day's work is done. On many farms the hour of closing is a very uncertain one. We have adopted the plan of ending the day's work at 6 P. M., and it is my judgment that as much or more is accomplished. It is a rare thing to see any shirking or "resting" during working hours; even the milking is completed at this hour. In fact, this is accomplished both night and morning. Men who work by the day, who do not milk, find their day's work done at 6 P. M. After studying very carefully all sides of the hour question I am convinced by the comparative ease in getting labor that this regularity of quitting, or the satisfaction of knowing when he gets through, has been a prime cause. I have not space or time in this article to discuss the means of boarding, whether in families or houses specially provided. Where only one man is kept he necessarily must become a member of the family. Where large numbers are employed this plan may be entirely impracticable. Get as much intelligence as possible with the wages at hand. Secure interest by good treatment and prompt payment. So arrange your business, if on a dairy farm, to give employment 12 months in the year, with an opportunity to get away two weeks during slack work. Understand your business thoroughly, so that employees may feel that they are accomplishing something, and much of the labor trouble will vanish. H. E. COOK.

To Milk a Kicking Cow.

First secure the head by placing a rope about the horns, and fastening the rope to a post. If hornless place rope about the neck; this will prevent jumping forward and backward in stall or stanchion. Have a strap to buckle about the neck, with a ring on it. Buckle a strap about the left hind leg below the fetlock joint, with a ring on it. Connect the two rings with a strap, and you can pull that leg forward clear of the floor at first, if an obstinate kicker, and gradually reduce the tension till she will be willing to stand without kicking. With this harness properly adjusted the animal cannot kick. It was used by my father for years for milking kicking cows, and he also used it in the castration of bulls while standing.

Hartford, Conn. D. K.

I feel inclined to add my word of advice about kicking cows. The most effective way I ever tried is with a good strong halter to pull the cow's head up so high that she cannot bear much weight on the fore feet. She cannot kick then, and will soon give up. The worst case I ever had was cured in about two weeks so the halter could be dispensed with. I drew the halter less and less tightly as the cow learned to stand. M. MORSE.

Massachusetts.

Sharples "Tubular" Dairy Separators.

If no agent will bring you a Sharples Separator we will loan you one for trial

FREE OF COST.

They give more butter than any other separator, enough to pay big interest on the whole first cost, and they turn much easier, besides being entirely simple, safe and durable, (former capacity doubled, with less driving power.)

Improvements come fast here. We have been making superior separators for 19 years (longest in America) and are proud of them, but these new "Tubulars" discount anything either ourselves or anyone has ever made. Free Book, "Business Dairying," and Catalogue No. 153.

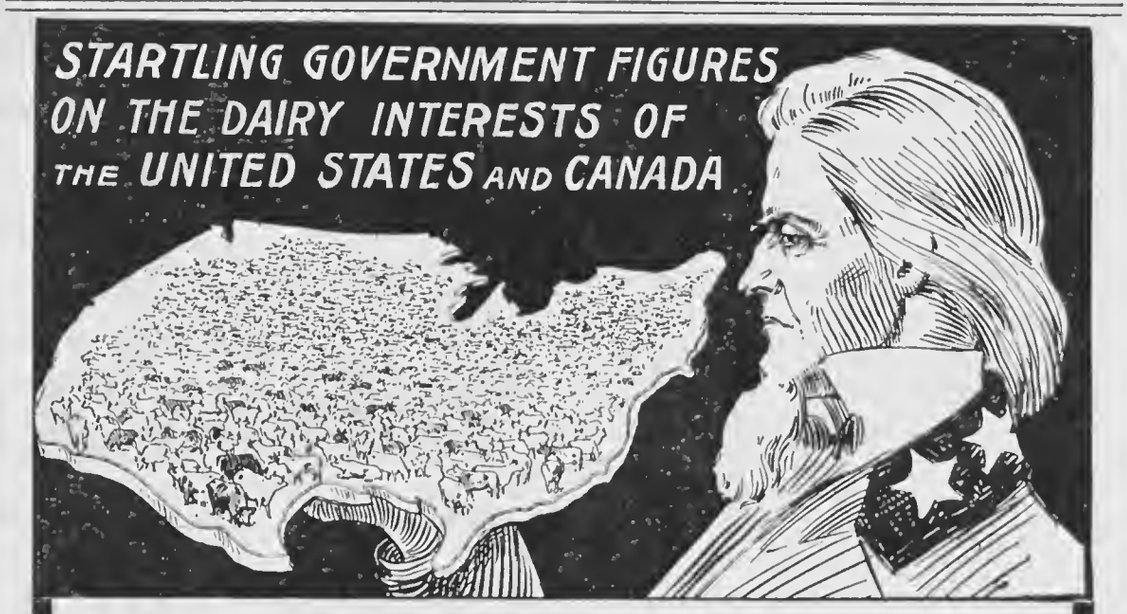
VT. FARM MACHINE CO., BELLOWS FALLS, VT



Twenty Per Cent. on 500 Million Dollars

A recent government report says that "there is in the United States and Canada one dairy cow for every four persons, or in other words 20,000,000 cows; and that the annual milk production is worth 500 million dollars. The dairy industry is fast becoming an exact science and over two billion of dollars is invested therein."

Two billion dollars invested and an annual output of half a billion (500 million) dollars worth of milk! Think for a moment and try to realize what a tremendous investment this is, and then think what a gain of 20 per cent will make to everyone interested in the industry. By the use of

CHILDS' SO-BOS-SO KILFLY

Cows will Give from 15% to 20% More Milk

and better milk if protected from flies by its use.

It is a thorough fly-killer and germicide, it destroys all bacterial germs, insuring healthy growth, strength and vigor to the animals; allays their nervousness, and expedites the work of the milkman. It is easily and rapidly applied with Child's Electric Sprayer and a herd of from 30 to 50 cows can be sprayed in a few minutes. SO-BOS-SO KILFLY is absolutely harmless to man and beast. It allays nervousness in horses as well as cows and keeps both in better general condition by the comfort it gives. As an antiseptic and for scours in calves, hog cholera, swine plague and foul in cattles' feet it is unequaled and may be used either in the stable, cow shed, chicken house or pig pen. Abortion in cows, which is caused by a germ- propagated by unsanitary conditions—can be prevented by the use of SO-BOS-SO KILFLY.

Sold only in gallon cans. Ask your dealer, or send $2.00 for one gal. can and Electric Sprayer complete, securely packed and express paid to any point east of Mississippi river except the state of Maine. The sprayer can also be used for spraying potato vines, bushes, trees, etc. Beware of imitations.

CONVENIENT, CHEAP, PRACTICAL. Thousands are in use in America, Canada and Mexico. Shipments have begun to Cuba, the Philippines, So. America and Australia.

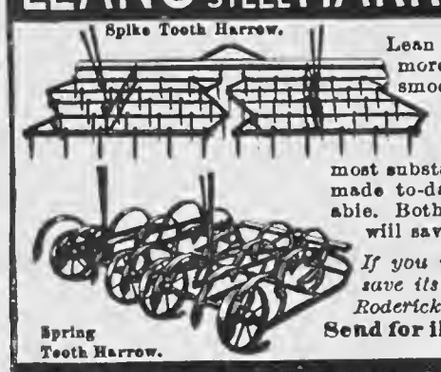
LEAN'S ALL STEEL HARROWS AND LAND ROLLERS.
Spike Tooth Harrow.


Lean harrows make fat harvests. They do more work and do it more efficiently than any other harrow. They tear up the ground, smooth it for sowing, harrow in the seed, kill the weeds after the crop comes up. The teeth are adjusted to suit any condition of the soil. By a touch of a lever they are instantly cleared of trash without stopping the team. The most substantial and finest finished farm implements made to-day. Made entirely of steel, light and durable. Both the spiked tooth and spring tooth harrow will save enough in a year to pay for itself.
If you want a Land Roller that will save its price in a single season, get a Roderick Lean Steel Land Roller.
Send for illustrated catalogue to-day.
Steel Land Roller

Spring Tooth Harrow.

THE
RURAL NEW-YORKER
A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2690. NEW YORK, AUGUST 17, 1901. $1 PER YEAR.

RYE IN EASTERN NEW YORK.

The Need of Potash.

The farmers of Columbia Co., N. Y., grow rye in the following manner: The first crop to be taken from the soil is either corn or potatoes. The following Spring oats are sown, and as soon as the oats are harvested the soil is prepared for rye, which is sown either the last of August, or the first of September. It is grown only once on the same piece of land in this rotation. Most of us drill it in, using some of the fertilizers at the same time. In this way it gets right with the grain roots at the start, giving it a quick start and a better growth. A fair crop of grain per acre is 20 bushels, and one ton of straw. It is a good crop to seed after sowing Timothy in the Fall, and clover the following Spring. The usual amount of seed per acre is 1½ to two bushels; it depends largely on the strength of the soil. I think the reason the straw is so weak and flimsy is the lack of potash in the soil.

Last Fall I drew a number of loads of weeds, briars, bushes and old hay, spread it thin on the land, burned it before sowing the rye. This year, wherever this refuse was burned, a very large growth of stiff straw was grown, and this was on land where there would have been nothing, scarcely, only for the ashes from this refuse. This straw stood right up, and wherever there are ashes clover will grow a heavy crop. The heads of the rye were much larger and better filled on these pieces. I put this refuse in different places on purpose to see whether any good resulted from it, and I found it paid well for the labor expended. G. W. H.

Columbia Co., N. Y.

The Story of Rye Culture.

Rye in Columbia Co., N. Y., has for many years been a most important crop. It began to supersede wheat early in the nineteenth century. The abundance of rye straw in this section made a pioneer local industry, manufacturing straw paper, a success. The ready market found for the farmers' straw in those days was doubtless their main reason for growing rye so extensively at an early date in this county, and it became really *the* monied crop of the times. Here rye comes into our rotation every three, four or five years, depending upon circumstances, corn on well-manured sod ground following the next year with oats, then rye with seeding of one or two succeeding years to clover and Timothy proving most satisfactory. Some seasons, when the grass seeding fails to catch well, rye follows one or two seasons of pasture, or it may follow Timothy after mowing for hay by plowing the sod under after harvest; when this is done two crops of rye are usually taken off the land before reseeding to grass again. Best results as a whole, however, have been obtained where the rotation stated above was adhered to, and such farming seems to keep the land in prime condition. If possible, all knolls, or places where the soil is thin, should be topdressed with barnyard manure before harrowing. In addition, at times, the whole field is treated with from 100 to 200 pounds of commercial fertilizer. The amount of straw and grain produced per acre varies from 1,200 pounds of straw and 11 or 12 bushels of grain to 3,500 pounds of straw and 30 bushels of rye.

We pronounce it a poor crop when we cannot obtain an average of 2,000 pounds of straw and 18 or 20 bushels of grain per acre for a season's product. Where followed in the regular rotation after corn and oats, the corn having been well manured, rye is an excellent crop with which to seed both clover and Timothy, the latter being seeded with rye in the Fall and clover the following Spring. For many years we have tried to select our seed rye as carefully as our corn, endeavoring to secure a large, plump, white kernel. Desiring to improve either straw or grain, we should aim at perfecting the grain, as the straw will grow to a great length and stand up well where the land is just right and suited to the crop, if the grain be not too thickly sown. Rye growing to a height of six or seven feet is apt to be injured and tangled by high winds and rainstorms, often causing great loss with much added labor in harvesting. This crop as a whole stands up best when sown thinly on a fairly good soil, or on moderately poor land well fertilized. We have seen 32 spears of rye grow from one seed. Rye stools out best, other things being equal, when sown early in the Fall. We prefer to have all of our rye sown in September, and by the 15th or 16th of the month at the latest. The amount sown per acre varies; on some grounds, rich and in good order, 1½ bushel of

A FIELD OF IMPROVED RYE. FIG. 245.

seed proves sufficient if drilled in, while land that is poor requires one bushel and three pecks. Some farmers use more, and we have done so, but topdressing the land, best results were obtained with the amount named. It never pays to pasture rye in the Fall unless it is early sown, and not then unless the ground is frozen, when it may be pastured with safety to a moderate extent. JOHN D. TOMPKINS.

Columbia Co., N. Y.

R. N.-Y.—The picture at Fig. 245 shows a field of rye grown by E. L. Clarkson, of Dutchess Co., N. Y. Mr. Clarkson has for several years been trying to improve a variety or strain of rye by careful selection. As a result he has developed a grain which seems to be a distinct improvement. It gives a heavy yield of grain and produces a long stiff straw which stands up well and gives a heavy yield per acre. The straw of rye is usually more valuable than the grain, especially where it can be handled and sold in bundles without baling. In northern New Jersey rye is the favorite small grain, for while it gives a smaller average yield than wheat, the straw can be sold from the wagon to the stablemen in the larger cities, and frequently brings $20 per ton. The old Dutch farmers believed that rye heads would clean the bots from the stomach of a horse. The heads were chopped, mixed with the ground feed and moistened. The belief was that the thick spines or "horns" on the rye heads scratched away the bots as they clung to the stomach wall. Many farmers still believe this and feed these heads in February or March. The grain of rye is not considered equal to wheat for stock feeding. While poultry will eat the whole grain they do not thrive on it. In New Jersey the grain is usually ground with corn in about equal proportions and fed to horses or hogs. Some dairymen believe that rye meal makes a poor quality of butter. It is, however, excellent for hog feed. The chief value of the crop lies in the straw. Formerly thrashing was done by hand, so as to keep the straw straight and unbroken. Now the thrashing machines have a special attachment for handling rye, so that the straw is held straight and can be bound into bundles the same as when it is thrashed by hand. The invention of this machine did much to stimulate the production of rye in the East. Wheat dropped in price, while rye straw was quoted at high figures. As a result many farmers in Monmouth and Middlesex counties, N. J., dropped wheat out of their rotation and substituted rye. Most of them have now gone back to wheat, but they find their farms well seeded to rye, so that the wheat is quite badly mixed. Most farmers who have tried both grains say that rye is the better crop for seeding to grass and clover. There may not be much difference in regard to this, but popular belief favors rye. The rye is less likely to be injured by insects, and will make a fair growth on poor land, being hardier and more of a hustler than wheat. It can also be seeded quite late in the season, and still make a fair crop. We sowed rye in early November last year, which produced good crops of straw and grain this year. It is often a great convenience to delay grain sowing until late in the Fall in order to take care of other crops first. It is often difficult, in a season like the present one, to get the potatoes out of the ground in time for wheat, but it is usually possible to fit potato ground for rye. This crop is often suggested for green manuring. It answers quite well for this purpose when plowed under while quite green. If we wait until the heads are well formed, the stalks usually become so tough and woody that they decay very slowly in the ground, and are not of much value to the season's crop. Some melon and tomato growers use rye in preference to clover, as they believe that cutworms and other insects which do much damage in a clover sod will not trouble the rye. Dairymen who follow the soiling system of feeding cut green fodder to their cows depend on rye to give them the first green food of the year. This early green feed comes in ahead of wheat, and while the rye is tender supplies the cows with a profitable "bite." This early rye grows very fast, and soon becomes hard and tough, so that the stock will refuse it. We have for several years cut considerable rye for hay, but it does not make very acceptable fodder. The horses eat it quite well, but it is best fed when run through the cutter or shredder in connection with cornstalks. Wheat makes a much better hay than does rye, yet, if the latter is cut early and well cured, it may be used as a Winter feed for horses in order to save Timothy.

THERE seems to be a complete upset in the laws of supply and demand when with the biggest wheat crop on record wheat bran mounts up in price.

GRASS SEEDED WITHOUT GRAIN.

The "Clark" System of Grass Culture.

PART III.

Why not use manure for the grass?

Some farmers do, and it must be said that they raise good crops of grass when the manure is plowed or harrowed in and well mixed with the soil. Mr. Clark objects to manure for grass, and stoutly advises chemicals for this crop. He would use manure only on a cultivated crop that is to precede grass.

When does he seed?

As soon after September 1 as the ground and weather are fit. There is not much use in putting fine seed into perfectly dry dust, for it will not sprout. If possible the seed might well be sown just before a gentle rain. That would make nearly ideal conditions for grass. The best time for sowing grass seed is at the natural season—that is, when the plant, left to itself, would mature and drop its seed. With Timothy, that would be in late August or early September, so that this time is about right if we would imitate nature.

Mr. Clark, we understand, does not use small grains in seeding.

No—he believes in sowing to grass alone.

Is not that contrary to the usual practice of most farmers?

Yes, for the greater part of grass seed is put in with wheat, rye or oats. It is argued that the little grass plants need a "nurse" crop in order to protect them from the freezing of the cold Winter and the heat of the first Spring.

What arguments does Mr. Clark put up against that?

At least a dozen good ones. He says that grass is the toughest and most enduring plant in the world. It will live and thrive if you give it a chance. It does not need any "nurse"; in fact, the growing and feeding habits of small grain and grass are quite distinct, so that when put together the grain will be more likely to take advantage of the grass than to "nurse" it. The space occupied by the grain plants will represent nearly one-third of the surface of the field, and when the grain is harvested these spaces are left bare, for the grass does not spread and cover them. Thus we lose the use of a good proportion of the ground. When the grass seed is used alone as Mr. Clark uses it, every square inch of the soil is covered with grass. Thus the entire field is utilized, it is possible to produce more grass per acre, and weeds and foul trash are less likely to work in. I have noticed this in my own fields. On the fields seeded after the Clark method there are comparatively few weeds, most of those which appear being deep rooted, with life below the reach of the Acme harrow. Following the grain-seeded fields there are always more weeds, which mostly start in the bare places left when the grain is cut. Mr. Clark claims, and I think with much reason, that it will usually pay better to grow a crop of grain alone, if grain is desired. and then work up the ground again and sow grass alone. This will give a crop each of grain and grass in two years with a better chance for each.

Is that true of all situations?

I do not think so. On light and level ground, or where the farmer does not have other crops to handle, the extra plowing and fitting will probably pay. There are some situations where this extra Fall plowing would hardly be possible. On tough, hilly soil, or in the class of farming which demands a great deal of extra work in August and September, the extra plowing and harrowing might cost more than the extra grass would be worth. This wet season would not permit us to work our soil properly. I can readily see that there may be cases where the Clark method would not be practicable. I think, however, that where the ground is suitable and the farmer has time and tools with which to fit the ground, and money to spend for fertilizers, this system is the right one for producing a large crop of grass.

But it must require more seed than when grain is sown.

It does—this heavy seeding is one point on which Mr. Clark lays great stress. When sowing with grain many farmers use only six or eight quarts of Timothy seed per acre, with about the same quantity of Red clover seed in the Spring. Very few of them, I think, ever use Red-top seed with the Timothy. Mr. Clark advises the use of 14 quarts each of Timothy and Red-top seed, and he makes a feature of putting this seed on a little at a time, so as to have it scattered evenly. After it is scattered he works the ground several times in different directions, so as still further to scatter and distribute the seed. One thing that is sometimes neglected is the surface of the field before seeding. Some farmers put the seed on the rough furrows or on the little ridges left by Cutaway or spring-tooth. This is a mistake, for the seed will settle into the little hollows, and cannot be scattered evenly with any tool—as wheat, oats or rye can be. Before seeding it pays to run over the ground with weeder, fine-tooth harrow or brush drag, so as to get a level surface.

Why does Mr. Clark sow Red-top?

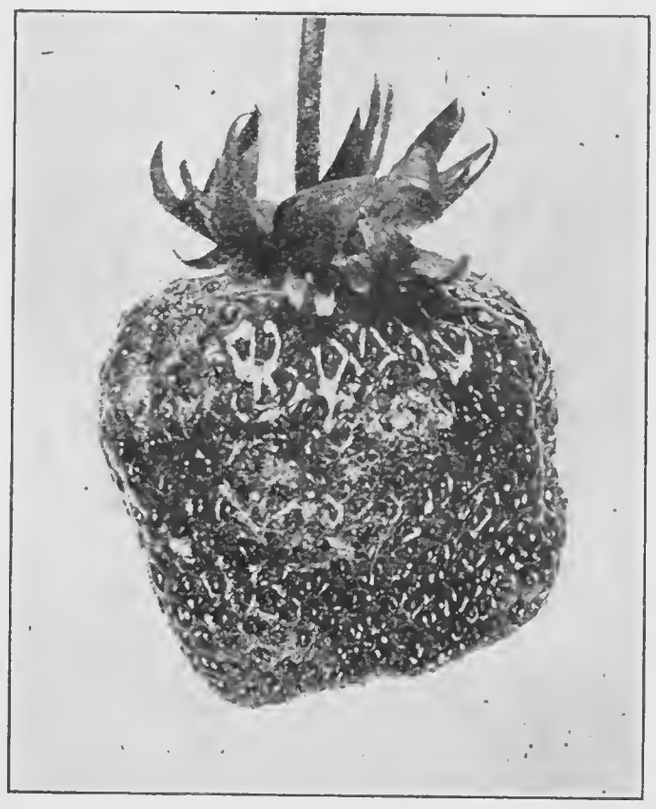
He says it will add from a ton to a ton and a half of hay per acre, which could not be obtained in any other way. The Red-top is a slender grass which will crowd in among the Timothy. It also helps out the stand as the meadow grows older. A field of pure Timothy runs out after a few years, but with a heavy seeding of Red-top the latter comes in more and more and keeps out the weeds and foul stuff. It must be remembered that this "Clark" method of seeding is intended to make a permanent meadow—that is, one that will cut good grass for a good many years—not one to serve in a rotation and be plowed in two or three seasons. H. W. C.

MORE ABOUT CRANBERRY CULTURE.

Uses of Land; Meadows.

In previous articles about cranberry culture, I have tried to describe in plain language the process of building a cranberry bog. To the prospective cranberry grower of limited means, who cannot afford to pay for the services of an expert, I would say go slowly. Read carefully the articles that have appeared in THE R. N.-Y., and then if you are not exactly sure you can grow them at a profit, experiment a little. Put in a rod or two of bog according to directions, and watch it for a season or two. If it looks promising, try some more, and by your experience you will learn something about the business. Many a good swamp has been spoiled in the making, and the owners have lost money where they should have made it.

We have read much about people converting swamp land into valuable meadow land, but in most cases it would be far more valuable if it were properly made into cranberry bog. The old way of building cranberry bogs was to get them done with as little expense as possible and then harvest the crop, if there was any, by hand. But in cranberry bogs as well as in other things, the old order changeth, and to-day bogs are made to suit the new method of harvesting. In this new method of building a bog, sand plays a most important part. The uses of sand on a bog are not fully understood by everyone, and I have been asked many questions in regard to it. It is used not only to keep down the weeds, but also to keep the vines from growing too rank. It also serves to keep the sun from drying up the moisture in the bottom, and at the same time gives a dry surface to work on. A correspondent from Maine asks the following questions about sand:



THE LINDENWALD STRAWBERRY. FIG. 246.

How far does it pay to haul sand to prepare a bog?

An acre of good bog properly cared for will produce an average yearly yield of 100 barrels of fruit; and in view of this fact it seems as though one could afford to go quite a distance. A bog of 200 acres was prepared under my supervision in Lower Canada, where the sand was hauled 20 miles on flat cars. It was not necessary to go so far to get it, but the cost of opening sand pits near the bog was greater than hauling it on cars from a cut in the railroad where the sand was of good quality and handy to load.

How can I test sand to see whether it is free from injurious substances?

Sand is liable to contain lime or "alkali," either of which is very injurious, if not fatal to cranberry vines. An expert could instantly detect the presence of either, but a simple way to test it to see whether it contains lime is to wet a small quantity and let it dry in the sun. If it cakes up there is lime in it, and it should not be used. To test for "alkali," put a tablespoonful of sand in a dipper of drinking water, stir it well, and when it settles, taste some of the water. If there is any alkali there, it can be easily detected. In the Eastern States, there is not much danger of finding anything injurious in sand except a mixture of clay or loam. Under no circumstances should clay be put on a bog.

If sand contains a trace of loam, could it not be washed and so made suitable?

For just a trace of loam, it would scarcely pay to go to the expense of washing it, as it would hardly do much damage to the bog except to promote the growth of weeds. It would be easier to pull out the weeds until the vines covered the surface of the bog than it would be to wash the sand. If the sand contains much loam it is not fit for use, for even if the weeds were kept out, the vines would grow too rank.

Describe a good arrangement for washing sand where running water from a stream is available.

If the sand was thrown through a coarse screen into running water the loam would probably be washed away, leaving the sand to settle on the bottom. It would also take out the stones in it. We are not sure, however, that it would pay to wash it for a bog of any size. It seems as though sand ought to be found in any locality entirely free from loam if one dug deep enough.

How many cords of sand does it take to sand one acre of bog?

In ordinary cases sand should be put on at least three inches deep. At this rate it would take 85 cords to sand an acre of bog. The same correspondent also asks how deep a bog should be flowed in Winter in his locality (Maine). It should be flowed deep enough so that ice cannot form among the vines. This rule will apply to any locality.

A correspondent from Connectieut asks about making swamp meadow land into cranberry bog. My experience has been that any piece of land that is well rooted with grass makes very poor bog unless the grass roots can be entirely eliminated. It will not do simply to turn the grass sods upside down and sand over them. The grass must be entirely killed out, and this is a very expensive thing to do, as anyone knows who has tried to do it. We know of swamps where wild cranberry vines were growing among the grass, and the owners thought that it would be a good place for cultivated berries, but it was not. The old grass came up through the sand, and in a year or two it was the same as before. The more wood there is on a swamp the better bog it makes. Of course it is more expensive to make it into a bog, but it pays in the end. A man from New York writes about a three-acre piece of peat bottom swamp where the peat was dug out 30 years ago, and has since filled up again. He wishes to know whether it will make good bog. If the swamp can be properly drained and has enough peat left to make a bottom with an average depth of 12 inches or more we think it would. At any rate, it would do no harm to experiment a little and see if it looks promising at the end of a year. F. A. MAKEPEACE.

Massachusetts.

WHAT THE "CORN BREEDERS" ARE DOING.

As some of our readers doubtless know, there is an organization in Illinois known as the Corn Breeders' Association. Its object is to improve the varieties of corn now in cultivation. This is to be done by selecting the best ears for seed purposes—making a standard and picking out ears as close to this as possible. The poorer plants are cut out, or the tassels are cut from them, so that only the finest specimens will be left for pollenizing. The following notes show what is being done this year:

We are more interested in the drought question than most men, having planted corn selected to a point nearly filling the revised score card of the Corn Growers' Association, and of high value as demonstrated by a chemical analysis of each and every ear, on ground especially prepared for developing a high grade of corn. We have given it thorough cultivation, and are watching the effect of this long siege of hot weather (with lack of moisture) upon it. In the meantime we are removing the tassels from all barren or inferior stalks, and are trying to agree upon some plan of seed houses in which the corn may be wintered in such a way that every grain may grow next year. Detasseling is important, because corn cannot be perfect if fertilized from pollen of barren or imperfect stalks. Fortunately, nature has provided pollen in abundance and to spare, and if one-third of all tassels are destroyed no harm will result to the crop. When all the points of breeding corn are as carefully studied and as long practiced as have been the points in stock breeding, the results will be as great. Our labor in advancing the breeding of corn may be nearly lost this year, by this drought, but be assured that the Corn Breeders will not give up beaten because of discouragements. E. E. CHESTER.

Champaign, Ill.

All of the members of our Association are engaged in the breeding of corn more or less as they can spare the ground and time. Breeding seed has been selected

by the director and chemist of the Agricultural Experiment Station, Urbana. A branch experiment station has been established on this farm, two advanced students in agriculture are in charge and have about 75 breeding plots of three varieties of corn. In addition the writer has plots of high and low protein corn and six plots of second-year breeding of Riley's Favorite yellow corn. All the plots are isolated; suckers, imperfect stalks and especially barren stalks have been pulled out. All our corn looked very fine until the recent hot and dry weather came, and now the outlook is not encouraging. Much of the corn in the fields is what is called "*fired*" (lower leaves dead and stalk turning red), and when it is at that point, later favorable conditions cannot possibly bring a good crop. In this corn belt we have had no rain since July 3, and hot sun and winds since. Corn on Fall plowing yet looks well mornings, on Spring plowing it is badly wilted, and only partially recovers nights. In examining my breeding plots I see that my second-year breeding shows a larger and stronger growth, and is less affected by drought than the one-year breeding plot on the same ground and conditions side by side. It would seem from that fact that breeding has a tendency to produce a stronger vitality.

Sibley, Ill. F. A. WARNER.

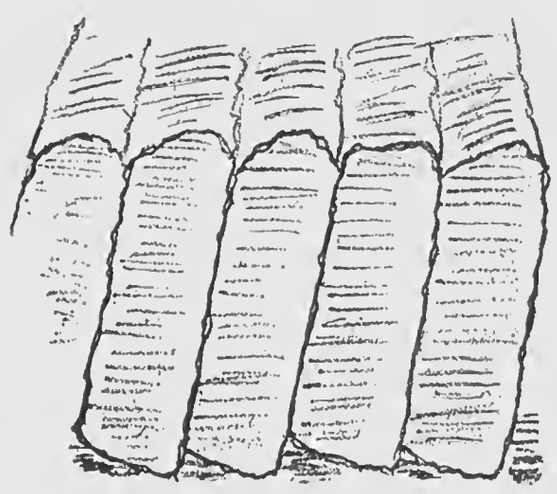
"FAIR AND SQUARE" CONNECTICUT GRASS

On page 515 we printed an article in which farm values of land in eastern Connecticut were well discussed. S. Marvin, who wrote the article, has since sent us samples of his corn and grass to show what can be done on this "abandoned" New England soil. The samples were astonishing. The corn, received July 26, stood nine feet eight inches high, with big stalks and an abundance of leaves. One sample of grass sown September 1, 1900, after a Summer fallow, without grain, contained stalks of Timothy 51 inches long, with Red-top 40 inches in length. Another sample of Timothy sown alone on October 1 measured 48 inches, and another mixture of Timothy and Red-top without grain, sown at the same time, measured 47 inches. This grass seems to be about as high as that grown by Mr. Clark, but is probably not so thick on the ground. Mr. Marvin tells his own story regarding this remarkable grass:

"The samples I send you are fair and square, as near an average as I could get. I sowed 12 acres with grass alone last Fall, ranging from the last week in August to October 1. The sample of Timothy was sown after potatoes; it came up finely, but the Winter was cold, and the ground bare of snow, and in February it turned brown and looked as though it would die out, so we gave it a heavy top dressing of stable manure which covered and protected it, and in the Spring went over it with a weeder to fine and break the lumps. It is to-day as handsome a piece of grass as you ever saw. I use the same fertilizer that Mr. Clark does, about 300 pounds per acre. I will tell you how I prepare my land for seeding to grass: We manure sod ground very heavily for corn, and are very particular not to have a weed go to seed, as potatoes follow the corn. The next Spring the corn hills are split cornerways, the corn having been planted 3½ feet square, which almost plows it. It is left for a few days to warm and dry, when it is harrowed down, and manured very heavily, no fertilizer being used on the potatoes, which are planted as soon as possible. No weeds being allowed to seed in the corn, there are very few in the potatoes, and they are easily kept clean. We dig our potatoes with a double moldboard plow, which about plows the ground and turns them nearly all out; the few remaining are easily and quickly uncovered with hooks. After the potatoes are all out every stone is picked from the field, for by so much working they are nearly all on top. The Cutaway harrow is started and with twice harrowing, the soil is as mellow as an ash heap. I sow my fertilizer, and then with a weeder mix it with and level the ground. The grass seed is sown each way, about 10 quarts each of Timothy and Red-top if sown together; if Timothy alone one-half bushel per acre. It is gone over once with a weeder to cover the seed, and bushed down level with six long straight cedars in a head about six feet long. I have no trouble in getting a splendid catch and a fine yield. In parts of the field that I send you samples of it is much larger, and is lodged and nearly flat."

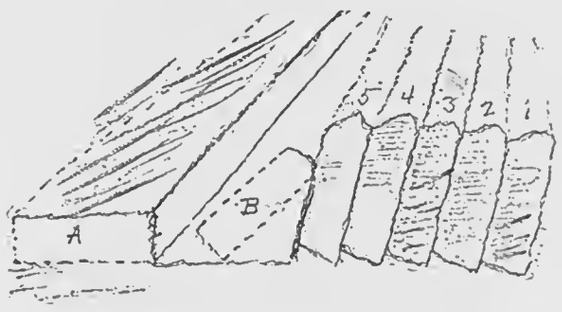
PLOWS AND PLOWING.

Much has been written from time to time as to why ground should be plowed, and how plowing should be done, to secure best results. Many sketches have been made showing the relative size, angle and lap of the average plow furrow, but these sketches seldom give a correct picture of the actual furrows, as made by the average plow. Fig. 247 is a copy I have made of a sketch of the cross section of some plow furrows, illustrated in a recent issue of an agricultural paper. This was intended to show how some plows turned a furrow at too steep an angle. In reality, no plow turns such a steep furrow, in actual use. It is impossible to turn such furrows in ordinary plowing, and the sketch is simply a monstrosity, or freak of the imagination of the writer or artist. Stiff June grass sod can be turned up to almost stand on edge, as Fig. 247 indicates, provided the plow is adjusted to cut a narrow, deep furrow. But the sketch shows a shallow, wide furrow, and no farmer ever owned a plow that could "perform" that way, and no such plowing was ever "performed." I have made Fig. 248 to show how such plowing, as shown in Fig. 247, would "work out," if any plowman attempted the feat. Granted that the first five furrows actually stand as shown in Fig. 247. The next furrow, A, of



THEORETICAL PLOWING. Fig. 247.

the same relative width and depth, is turned up and over by the plow, adjusted to cut and turn furrows of similar size. Where would it lie, or stand? The dotted line, Fig. 248, indicates its position, in cross section, and no plow, or moldboard adjustment of any plow, could possibly carry the sixth furrow, A, far enough to the right to stand it on edge beside the fifth furrow. The writer of the article is wrong in making a sketch, showing such a relative impossibil-



SUCH PLOWING IS IMPOSSIBLE. Fig. 248.

ity, and stating that "much plowing is to be seen as indicated in Fig. 247."

How does the average plow turn, or leave a furrow? I went into our cornfield a few weeks ago, when our man was plowing clover and Timothy sod for corn. The plow used was, and is, a general favorite throughout the country. It was set to plow a furrow eight inches deep and 14 inches wide. I took a spade and carefully cut out a vertical section of three fur-

PICTURE OF ACTUAL PLOWING. Fig. 248.

rows, and took a photograph, as shown herewith. It was a cloudy day, but I secured a fair picture, which shows just how a cross section of the average furrow looks. In reality, there is but a slight "lap," the furrows lying not quite flat. The furrows shown in this picture are of the model variety. The plow is a standard make for this section of country, with the proper width, height and curvature of moldboard. The furrows illustrated are similar to those turned by a great many thousand farmers who read this paper. We use a jointer to turn under grass, manure and the upper 1½ inch of surface soil, which leaves a perfectly clean furrow, as no trash can stick out. The moldboard, in lifting and turning, manipulates or agitates every cubic inch of the furrow, as the picture shows. The whole process loosens and aerates the furrows, and leaves them in fine condition for further operation thereon by means of the harrow and roller. The ideal soil for manipulation with these tools is a clay loam, with a slight admixture of sand. In another article I will take up the adjustment of the plow, from a plowman's standpoint.

Calhoun Co., Mich. J. H. BROWN.

A TALK ABOUT CHERRIES.

I notice that Mr. Van Deman, page 516, bases his objection to the white sweet cherries on their poor selling qualities, and one might infer from what he says that they are hardier than the red and black sweet cherries. White sweet cherries are very scarce here. The only ones I have ever seen, I think were said to be Yellow Spanish. They seemed superior in size and quality to any of the red or black sweet cherries I have seen . Our experiment station says that they crack and decay badly in wet weather. Windsor is the most thrifty grower I have. The trees set six years ago have bloomed twice, but the bloom has been killed each time except one fruit last year. They are more tender in bud than Gov. Wood or Downer's Late Red on my grounds. Montmorency set the same year as Windsor, and bore a full crop the Summer after the hard freeze. Gov. Wood is the most productive sweet cherry I have, but is not equal to Downer or Windsor in quality. In answer to G. H. W., I will say that I think it is easier to raise two bushels of sour cherries than one of sweet. Can THE R. N.-Y. give me any information in regard to the Choisy cherry? The Michigan Experiment Station bulletin for 1891 says: "It takes first place as the finest as well as the most beautiful of cherries of any class; its only drawback being its somewhat deficient productiveness." In other bulletins it is described as very hardy, and as productive upon sandy soils. My land is sandy with a sand and gravel subsoil, but is low, being on the second bottom of Grand River, and is exposed to northwest winds. I am extremely anxious to get information about this cherry. Is it hardy in bud? Is it moderately productive upon such soil as mine? Who grows the trees? I cannot find it in the catalogues. C. F. C.

Grand Rapids, Mich.

It was not my intention to lead anyone to think that white sweet cherries were more productive or hardier than other classes, but I do know that some of them are among the most productive in some sections. This is notably true of the Napoleon, when grown on the Pacific coast, where it is called Royal Ann. It is not a white or yellow cherry, properly speaking, but has a red cheek in the Eastern States, and in the Far West turns almost red when fully ripe. There are at this time (August 1) some very fine specimens of this variety on the tables at the Pan-American Exposition from Benzie Co., Mich. It is large and less liable to rot and crack than Yellow Spanish, and most other light-colored cherries, but it is not so sweet nor so light in color as that variety. Rockport is another good sweet cherry that is yellow with a red cheek. Governor Wood is generally liked as a yellow and red or very pale red cherry. But I fully agree with C. F. C. that it is easier to grow two bushels of sour cherries than one of any kind of sweet ones in most places east of the Rocky Mountains. However, in the foothills of the Blue Ridge there are some wonderful crops of sweet cherries grown; especially in parts of Virginia, Maryland and Pennsylvania. Choisy is rarely grown. It is not a true sweet cherry, but is somewhat tart and yet of very high quality. I hope those who can give direct answers to the questions about its hardiness of bud and productiveness on sandy land, or any other special points of interest about it will do so. H. E. VAN DEMAN.

A NEW STRAWBERRY.—Samples of a seedling strawberry were received from I. S. Palmer, of Stuyvesant, N. Y., on June 19. The berries reached us in good condition, firm and solid, with good color. The flavor was pronounced, and judging from these samples, the berry is a good one. A fair-sized specimen was engraved and is shown at Fig. 246. Mr. Palmer writes: "It is a seedling of Jessie and Bubach. I think it is the coming berry. I have named it Lindenwald."

DESTROYING THE CHERRY APHIS.—Having had a little experience in growing sour cherries, I have had experience with cherry pests, nothing, however, being so troublesome as black lice. During July, 1900, I had 125 sour cherry trees attacked by these little enemies, completely covering the underside of leaves on all the new growth. I at once sprayed them with kerosene emulsion with no satisfactory results. A second treatment failing, finally in despair, I used kerosene and water, half and half, and killed one tree, severely damaging several others. By this time cool weather and frosts, and the falling of the leaves caused the disappearance of the aphids. Again in July this year they appeared in greatly increased numbers. I tried another plan, using twice the amount of soap that the formulas usually give, and instead of applying it in form of a spray, having a large barrel pump, with extra air chamber, I kept nozzle closed and pumped up the pressure as high as I could, then applied the emulsion in form of a very vigorous stream, almost taking some of the leaves off the tree. This one application cleared my orchard of every trace of the pest, and I have yet to see any injury to trees or foliage. C. W. F.

Wayville, N. Y.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Blighted Corn Fodder.

S. D. H., Prather, Ind.—The corn in this locality has been blighted by the sun and hot winds, and will not produce grain. Will the fodder possess the same amount of feeding value as usual if harvested and shredded in good condition?

ANS.—No, the fodder will not be as useful for feeding as that which grows naturally. We consider such fodder damaged at least 25 per cent. Still, if shredded or cut, it is well worth saving.

When to Fertilize Grass.

J. T. B., Beverly, W. Va.—When is the best time to apply commercial fertilizers on meadows, soon after mowing or early in Spring?

ANS.—Probably the best way to fertilize grass would be to apply the potash and phosphoric acid during late Summer and Fall—after mowing—and the nitrogen in the form of nitrate of soda in the Spring. On level ground we would prefer Fall to Spring if all the fertilizer were to be used at once.

The Value of "Water Paints."

M. R. M., Jamestown, N. Y.—Can THE R. N.-Y. give us any reliable, unbiased opinion, based on personal experience, of the so-called "water paints?" Are they equal to the oil and lead paints for outside work? Do they preserve the boards? Are they lasting, and do they look well, or like colored kalsomine and its many successors? How is it applied? Is the cost much less than ordinary paint? We have a number of outbuildings needing paint, and we wish to have the work done as cheaply as it can be well done.

ANS.—We would like to have readers who have tried these paints give a fair statement of their experience. There is considerable call for such information.

Carolina Poplar from Seed.

E. P., Amityville, N. Y.—I wish to sow some Carolina poplar seed. When is the best time, in Fall or Spring, and how am I to treat the seeds?

ANS.—Seeds of the Carolina poplar and other varieties of poplars, cottonwood, etc., should be sown as soon as ripe, and lightly raked into the soil. The Carolina poplar is generally propagated by cuttings of ripe wood cut in the Fall or Spring, and firmly planted five or six inches apart in rows wide enough to admit horse culture. The cuttings may be made about 10 inches long and set with one or two buds out of the ground.

Lucretia Dewberry.

R. C. S., Springfield, Mass.—We have just fruited the Lucretia dewberry and are very much pleased with it. We would like full particulars, if obtainable, as to its origin.

ANS.—Reference to the origin of the Lucretia dewberry was made on page 550 last week. It is related that the original plant was found by a soldier during the Civil War near Beverly, W. Va., who afterward acquired it by marrying the owner of the plantation. Plants were later sent to Ohio, and fell into the hands of B. F. Albaugh, Covington, O., who named and introduced it to commerce. The true variety is most excellent, but there are many spurious forms of it in cultivation.

Hollow-Stemmed Celery.

J. H. P., Willimantic, Conn.—We experience much loss from celery growing with hollow stems. Is the cause in the variety or manner of cultivation?

ANS.—Hollow heart or stem in celery seems to be a defect in nutrition, and prevails more extensively on light than heavy soils. It is favored by dry weather, lack of available fertility and attacks of grubs or other causes injuring the rootlets. It is to a certain extent a hereditary defect, and plants raised from the best seeds are rarely affected. The dwarf varieties are less affected than the taller kinds. Use strong plants, set about at surface level on good soil, well enriched with old manure, and with proper cultivation the trouble should diminish.

Suitable Soils for Differing Crops.

J. C., New York.—Will you tell me whether Long Island or New Jersey soil is better suited for an assorted orchard (apple, peach, pear and plum)? What soil excels for the following products: Beets, carrots, corn, cucumbers, melons, onions and potatoes? Also compare Pennsylvania in relation to its soil.

ANS.—Soils entirely suitable for the crops named may be found in either locality, but probably Long Island and portions of New Jersey are better adapted to stone fruits, such as peaches and plums, than eastern Pennsylvania. The selection of a site for commercial fruit and vegetable garden is more a matter of convenience to market and suitability of climate than of geographical location. The soils of Long Island and the northern coast region of New Jersey average lighter in quality than those of Pennsylvania.

Killing Out Witch Grass.

R., Turner Center, Me.—I have a piece of land I intended to set to raspberries and blackberries. I seeded it to clover to plow under, but it has filled in to Witch grass. Is there any way to get rid of this so that I can set the plants in the Spring?

ANS.—It is late now to begin on this grass, but with dry weather you may destroy it. The grass spreads underground, and unless the roots are broken and brought up to the surface or cut off again and again there will surely be a new crop. Mere plowing, with the use of a shallow cultivator, will not kill out the grass. Some digging or jerking tool like a spring-tooth, disk or Cutaway harrow is needed to cut and pull the roots up to the surface. We would plow the ground as soon as possible, and keep at it constantly with one of the above-named tools. Keep the soil open and, if possible, never let the ground become green. The best time to kill out the grass is in June and July, but if August is dry you may kill it yet.

Columbian Raspberry Compared with Blackcaps

Has the Columbian raspberry demonstrated its early claims of superiority to the Shaffer, especially in points of productiveness and hardiness of cane in Winter? Is the latter yet preferred by anyone, and upon what grounds? How would either of these purple kinds compare with the Cuthbert (or any other good red variety) as to root hardiness for planting in cold black soil, over-wet most of the year, adjacent to swamp land?

I have never yet admitted that there is any difference between the Columbian and Shaffer Colossal raspberry, except that there were two distinct types of berry in the Shaffer, and that Columbian is one of these types. I have taken branches of fruit from the Columbian and Shaffer raspberry bushes, numbered them, placed them in our fruit cellar and called in three or four fruit men, practical men, too, who have grown and cultivated small fruits for a number of years. Not one of these men could separate Columbian from Shaffer. I, of course, had selected branches from the Shaffer that were of the same type as the Columbian. I might also state that these branches were taken from a block of Shaffers planted several years before Columbian was introduced. Either the Columbian or Shaffer are quite as hardy as the Cuthbert, Marlboro or Loudon. The canes are of a much more vigorous growth and will bear at least three times more fruit than any of the red varieties named. The fruit is larger, as firm, and as good a shipper as any of the reds. The color is unattractive and against the berry for market purposes. The flavor, when fully ripe, is very fine. Many of my friends prefer it to the flavor of the reds. We grow the Columbian and Shaffer in separate blocks and in a limited acreage, although we are extending our planting of these varieties for the reason that during the last two or three years, we have been unable to supply the local demand for these berries, which are used by those who know their value almost exclusively for canning purposes. They should be grown for this purpose, and for supplying the local market. With these advantages, it is the most profitable raspberry we know. We would not advise planting the Columbian or Shaffer on the soil and under the conditions named. While the Shaffer and Columbian are exceptionally hardy, they, of course, will, like other fruits, show bad results from "wet feet."

Cornwall, N. Y. T. J. DWYER.

The Columbian raspberry has generally proved superior to the Shaffer. The purple varieties will never take the place of the red, like the Cuthbert. It is more likely to take the place of the black raspberry for family use and canning, but not for evaporating. Its yield is much more than either the red or black varieties. The points superior to the Shaffer are firmness, adhering to the bush, not liable to be blown off by the winds. It is not quite as acid, is somewhat more hardy and makes a better growth of bush, not requiring an annual cutting out of stalks like the Shaffer. It freezes back sometimes, but not so badly but what it will throw out new canes near the ground and produce a paying crop. I would advise setting on none but ground free from water during the Winter. CHAS. MILLS.

Onondaga Co., N. Y.

I have grown the Columbian raspberry for a number of years with good success. This season has fully convinced me that it is a very valuable variety. As to hardiness of cane I consider it as hardy as Gregg, having grown both these varieties side by side for some time, on the same kind of soil, and under same conditions. Without Winter protection Columbian stood February 27, 1900, a temperature of 20 degrees below zero, and came through with scarcely a tip killed. In spite of productiveness I know of no other red variety that equals it grown in this section. I do not grow Shaffer, but believe that Columbian will compare favorably with Cuthbert or any other good red variety. I have grown it on different kinds of soil, varying from a light gravelly loam to heavy clay loam, also on rich garden soil. While I know a few growers who have had fairly good success, on rather heavy black moist soil, I would not advise your reader in Massachusetts to plant very extensively on such land as described. G. W. H.

Butler Co., Pa.

Apple Questions; Yield of Beans.

C. F. B., Newton, Mass.—1. What is the Bishop Pippin? 2. What is the value of Dyer, Lawver and Grimes; first for commercial purposes; second, as to quality? 3. What is an average yield of pod beans to the acre?

ANS.—1. Bishop Pippin is one of the names by which the Yellow Bellflower is known in Nova Scotia. 2. Dyer is one of our best Summer apples. It is not very attractive in color, being greenish white with rarely a blush on the sunny side, but it is tender in flesh and delicate in flavor, which make it very desirable for family use. Lawver is a very handsome apple, of fair quality and keeps very late, but it is a poor bearer and from a practical standpoint is of no value, for either amateur or commercial purposes. It has been named Delaware Red Winter, which was a blunder that has added the cost of experimenting with it a second time, and confused its nomenclature as well. Grimes is one of the best of all apples of any season in regard to quality, and it has a beautiful yellow color which makes it especially desirable where a yellow apple is wanted. The tree is hardy, healthy, of good form and bears well. I know of no variety which is more desirable for family and fancy market purposes, that will keep about as late as Hubbardston. In Massachusetts it will be a true Winter apple, but in the Central States it is only a late Fall or early Winter variety. 3. From 30 to 35 bushels per acre is about the average for ordinary field beans. H. E. V. D.

IN PAINTING barn or house it is well to remember that Pure White Lead never cracks or peels, but wears away very slowly and gradually, perfectly protecting the wood from decay so long as a vestige of the paint remains upon the surface.

In repainting a building, if Pure White Lead is used in the first instance, no dangerous gasolene paint burner is required to put the surface in good condition for a new coat.

The brands of Pure White Lead manufactured by the National Lead Company, named in margin, are made by the "*old Dutch process*" of slow corrosion and are the best White Lead that it is possible to manufacture.

For any color or shade required, use NATIONAL LEAD COMPANY'S Pure White Lead Tinting Colors. Pamphlet sent free upon application.

National Lead Co., 100 William Street, New York.

The New Horticulture

BY H. M. STRINGFELLOW.

We do not hesitate to say that this is one of the most interesting books on horticulture that ever was printed. Most reading farmers have heard of the now famous "Stringfellow Method" of planting trees, but few understand clearly what it is. This book tells the whole story in clear-cut, forcible style, which all can understand. Not only is the theory of close root-pruning carefully explained, but the general principles of gardening and fruit-growing are discussed. Mr. Stringfellow is a practical gardener, and he gives his own experience. We commend the book to all without reserve. New Edition, paper covers, 50 cents.

THE RURAL NEW-YORKER, New York.

EVERYBODY'S GARDEN.

SAVING SEED.—Generally speaking, the proper time for selecting and saving seed is just as soon as it is well matured. There are doubtless some exceptions, as in developing early strains of tomatoes, when to a certain extent, seed from unripe fruits may be used to advantage. Potatoes for seed purposes are thought by many growers to be more vigorous if dug before thoroughly ripe. Be this as it may, wherever possible the seed should be selected before the main crop is harvested, or if not gathered should be sought out and so marked that there will be no difficulty in securing it at a convenient time.

SWEET CORN may be gathered with safety as soon as thoroughly glazed, or when the inner husks begin to turn yellow. Strip the husks, leaving two or three, and tie two ears together and hang up on poles, freely exposed to the air, but secure from rain or dampness. Peas and beans are best cared for by pulling the vines at the proper time and after stripping off all inferior pods, hang up the vines with the same precautions as noted for sweet corn. When thoroughly dried, thrash out or shell and tie up securely in strong paper bags and carefully label.

TOMATO SEED.—The plan much in use of allowing the fruits to lie exposed to the sun and rain until rotted down is not at all desirable, and should be discontinued. First, if the seed by remaining in the rot and filth is not injured outright, it is at least not benefited by its surroundings, and the work of washing out the filth is in no sense a pleasant task. Second, in establishing a type of tomatoes, or holding or improving a type already established, it is not safe to trust to outside appearances alone. Tomatoes growing side by side upon the same vine, and almost identical to outward appearances, will often differ widely as to inner conditions and number of seeds. Other things being equal, the more meat and the fewer seeds we have the better, so the only safe test is the knife. Select them, the finest specimens obtainable, halve them crosswise and save only those following closest to the desired type inwardly. With a spoon scoop out the seeds into a sieve, and the pulp is easily separated by holding the sieve in water and rubbing it through, leaving the seed clean and ready for drying. The Hunter flour sifter, used by nearly every housewife, is an ideal sieve for washing the seed; held under a faucet of running water, or lacking this, held in a pail or pan of water and turning the crank the work is quickly and nicely done. The seed is easily dried by spreading on cloth or muslin and exposing to the sun and air. Do not expose to too much wind, as when dried, the seed is light, and is easily blown away. This plan is preferable to drying by heat, as it may be easily overheated and spoiled. Like nearly all other seeds, however, when thoroughly dried almost any degree of dry cold will be harmless.

SALT AND ASHES.—When the leaves of tomato, egg plant, pepper and other plants turn yellow and fail to set fruits as generously as desired, try an application of salt and ashes. A small handful of the mixture in the proportion of one part of the former to four or five parts of the latter, sprinkled around the hill will give new life and vigor to the plants.

CARE OF TOOLS.—All are not so situated that they can buy every desirable tool and labor-saving device now offered in the market, but every one is so situated that he can keep such tools as he does possess in the best possible order for easy and thorough work. I estimate that fully 25 per cent of time and labor may be saved by keeping tools in proper shape and repair, and having a place for everything, and keeping everything in its place. A rusty plow, cultivator, spade or hoe will tire out man and beast before the task is half completed, and the work be poorly done at that. When through using, the tools should be thoroughly cleaned and safely sheltered, and when finally laid aside for the season they should be painted with crude petroleum, axle grease or something of that nature to prevent rusting through the Winter. Keep the shovels, hoes and spades sharp, and for this purpose an eight-inch flat file or even larger, costing but a few cents, will save dollars in time and many a weariness during the season. Always file the tools on a true bevel from the upper side of the blade, as this gives the tool the tendency to cut more deeply and stick more closely to the work, while filing from the underside has the directly opposite effect. Some day when the mercury is soaring upward and the sun's rays are coming down by the shortest possible route, go out with your dull and rusty hoe and hoe for an hour or two in the weeds and grass; then stop and scour and file your hoe until sharp, and try it again, and you will wonder why you did not try it before beginning to hoe. If you find a tool broken or otherwise out of repair, stop then and there, if possible to do so, and make the needed repair. If not convenient or practical to do it at once make a note of it for the first possible opportunity. Often a few minutes' work done at once will save hours later on.

A HANDY TABLE.—A very cheap and convenient table for draining and tying up vegetables after being washed is made as follows: The legs are made of 2x2-inch stuff four feet long. With a three-eighths or half inch bit bore a hole through each leg 18 inches from the foot and bolt two legs together with bolt and nut. The top rails are 1x2-inch stuff, and any length desired for the table, halved into the top of legs. The lower rails are 1x1-inch and halved into the legs six inches from the foot, and secured with nails or screws. The top is made of heavy burlap which may be had of any upholsterer for 10 or 12 cents per yard. Tack this lengthwise to the upper rails, and you have a table made on the same principle as the folding cot, and when once used will not be dispensed with. When desired for use, the table may be set convenient to the washing place, and as soon as washed the vegetables may be bunched or tied and left to drain without danger of soiling with the mud and dirt. When not in use it may be folded and set aside where it will occupy but little room. Of course any height and width of table desired may be made, and this will be governed entirely by the length of legs and the distance of bolting the legs together from the feet.

J. E. MORSE.

Michigan.

USING FERTILIZER WITH WHEAT.

Shall We Drill or Broadcast?

My experience with fertilizers for wheat includes both broadcast and drilling, complete and partial manures, and in amounts not exceeding 250 pounds per acre. No appreciable difference in results, so far as stand of plants, or in the final outcome, has been noticed by either method. Last season I used dissolved rock on clay land, about 250 pounds per acre, drilling with ordinary form of fertilizing drill, and the yield was 24 bushels per acre, average, machine measure, which is the best yield reported in the neighborhood. We have used both commercial and stable manures, in large quantities, on *growing* fruit plants, applying by both methods, that of broadcasting and in trenches. The broadcast gave best results. For seeds, as wheat, where amounts are not excessive, drilling will give, on our soil, as good results as broadcasting, and is to be preferred, as being more economical of labor. If applications were heavy, say 500 pounds or more per acre, reasoning from our experience in fruits, I would rather risk broadcasting. I may say that the purpose for which fertilizer is used, by our best farmers here, is to stimulate the wheat to extra growth in the Fall, and not to supply (primarily) plant food to produce a crop of grain. The Hessian fly damages early-sown wheat so badly as to compel sowing from two to four weeks later now than formerly. The problem now is to sow late enough to avoid the fly, and at the same time to develop a growth strong enough to withstand the Winter. For this purpose fertilizing is nearly a necessity, and drilling answers every purpose.

RALPH W. MOSS.

Indiana.

Close observing farmers have long understood that it is not wise for them to make heavy applications of commercial fertilizers with wheat when the ground is too dry for good germination. It is generally believed that under such conditions a heavy application of phosphate or of complete fertilizer that contains a large amount of phosphoric acid, injures the germination to a greater or less extent. I am not aware that accurate experiments have been made to determine to what extent the germination is injured under such conditions. The extent of injury would undoubtedly depend largely upon the amount of moisture present in the soil, and upon the amount and kind of fertilizer applied. It is also held by practical agriculturists that less benefit is derived from the fertilizer if the application is made when the ground is dry than when sown under more favorable conditions as regards moisture. When the ground is dry a moderate or light application of commercial fertilizer should be made if loss of plant food is to be reduced and injury to germination avoided.

[Prof.] G. C. WATSON.

Pa. State College.

Bright Spots in Florida.

There are some parts of Florida that are not desirable for any kind of settlers to locate in, but others are good agricultural country. I can make more pork and beef from the products of an acre here than in any other State I know, and I lived in the Blue-grass section of Kentucky until I was over 30 years of age, and still own a farm of 240 acres there. This is a good farming country in spots, and the spots are good large ones, but there are no farmers here. When I came here the farmers pulled a little fodder, and their hogs fattened on mash. I can make hay here at less cost than anywhere, except on the prairies, but mine will be better hay, and we are now curing our own pork. When I first came here one of my neighbors told me, when asked about milk, that he had 24 cows, and he sometimes got as much as a quart of milk at a milking. We now have cows that give four gallons per day. There are some pretty good fruit growers and some good vegetable growers in the State, but very few farmers, and there is a splendid opening here for good ones. If you can see some one connected with the large Winter hotels here, ask him what they would pay for good chickens and eggs for their hotels. They will name a good price, but will tell you that they can't depend on Florida for their supply. Yet there is no better chicken country than this; eggs can be set in September and have broilers ready for the tourists' hotels but nobody tries it. The people who come here hear of some one who has made a big thing in vegetables or fruits, and at it they go. They want to get rich quick, and "go broke." If they would be satisfied with good living, steady but what seem to be slow gains, they would do much better.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

WET WEATHER EFFECTS.—The Jersey coast region has suffered much from the intense humidity generally overlying the Eastern States. Only two decided breaks in the moist conditions have occurred since early May, though the actual rainfall has but little exceeded the average. The heat was sufficient to brown grass on exposed slopes during a 10-days' cessation from drizzling showers, but the soil has always been moist at the depth of a few inches, and at times quite saturated. This condition has its drawbacks, but is far preferable to the terrible droughts ravaging the Middle West. Coast vegetation naturally does not endure dry weather as well as that of the interior, and quickly shrivels when the surface moisture becomes attenuated, as it does not root deeply in the thin soils characteristic of the region. It is interesting to note the effect of excessive humidity on some very diverse plants. Cherries are a total failure as regards fruit, and many heretofore healthy trees have been nearly defoliated by the shot-hole fungus. Vigorous young trees of both the sweet and sour types lost most of their leaves early in June, but have continued growth with a scanty new covering. Some old trees are now almost bare, and likely to remain so until next Spring. But few cherries set on account of interference of the rain with pollination, and then generally rotted or made a poor development, though there were some local exceptions. Japan plums also show yellowness and weakness of foliage, and the crop of plums will be light. Brown rot is developing rapidly, and much loss will probably ensue. Grapevines are making a surprisingly fine growth, the great heat being much to their liking, though they would get along still better with less humidity. There is certain to be a considerable loss from rot. Apples are as near failure as we have known for many years. The foliage is imperfect in most instances, and the young fruits are developing in a very one-sided manner. Peach trees look well where proper care is taken, and promise a tolerable yield of the late varieties. Blackberries are abundant and large, though soft in quality. Potatoes are giving an indifferent yield, not at all in keeping with the luxuriant growth of top. The local hay and grain crop promised exceedingly well, but was seriously damaged almost without exception before it could be secured. The foliage of tomatoes blighted considerably early in the season, and most of the early blooms failed, but they are growing vigorously now.

The redeeming features of an otherwise trying season are the luxuriance of the corn crop and the refreshing verdure of the fields, which never were greener in midsummer, and the brillancy of some native flowers, notably Lilium superbum, the American Turk's cap lily, and the butterfly weed or orange milkweed, Asclepias tuberosa. This lily grows in moist shaded lowlands, preferably on the banks of sluggish streams, while the milkweed prefers dry hillsides. Both are benefited by showery weather and have seldom bloomed more brilliantly than at present. Thousands of lily bulbs that fail to develop buds in dry or normal seasons now open fine panicles of bloom, containing at times several ranks of flowers. Few wild plants are so entirely satisfactory and harmonious in color effect when viewed in their natural surroundings, and it would seem almost a desecration to force them into extensive cultivation as long as they can be found in quantity in waste places. They ask no odds in decorative effect from the cultivator or plant breeder.

THE SHIRO PLUM.—Fig. 250, this page, is a fair likeness of a Shiro plum grown by J. H. Black, Son & Co., Hightstown, N. J. Shiro is one of Burbank's productions, now fairly well disseminated, and beginning to fruit in the East. Shiro is said by Burbank to be the result of a triple hybridization of Robinson, Myrobalan and Wickson, and is a handsome golden green plum of fine quality, about equaling Abundance in that respect, but has the advantage of resisting the brown rot much better. Messrs. Black say that the specimen illustrated is from a graft on a Satsuma tree which has never ripened a plum on account of rot, yet the Shiro fruits have not been affected in the least in two bearing seasons. This is a very important characteristic if confirmed by extended tests. The Shiro tree on the Rural Grounds is growing vigorously, but has not attained bearing size. It seems well suited on peach wood; a bud put in a strong young seedling peach is growing so rapidly that it overtops a similar peach bud on the opposite side of the trunk. Most Japan and hybrid plums grow well on peach stocks, but are soon starved if peach sprouts are allowed to push, and it is rare, in our experience, to find plum wood keeping pace with peach on the same stock. Shiro is firm and carries well, qualities that may make it useful for market.

PLANTS of a new thornless blackcap raspberry were received from James B.

THE SHIRO PLUM. FIG. 250.

Stevens, Danbury, Conn., April 25, 1900. They were well planted and made a satisfactory growth last year. They set an abundance of good-sized berries this season, but exhibited such unmistakable symptoms of anthracnose just before ripening that the plants were destroyed to prevent further infection of others. Thornless blackberries and raspberries are generally weak growers, and have never proven satisfactory.

THE MCDONALD BERRY.—The possibilities of the blackberry are very inviting, and much progress has been made in improving our native species, which are on the whole more agreeable in flavor than many fruits that have been coddled in gardens for generations. One can imagine the blackberry of the future to be an immense, juicy and luscious fruit with a minimum number of small seeds, altogether transcending anything now grown, but we are scarcely prepared to credit the yield of 20 quarts per plant for the McDonald berry, a tree dewberry of Texas origin, now grown in California. We think two or three quarts to a plant a very good yield here in the benighted East. It is said to be nearly evergreen in character, the berries of great size, and rich sweet quality. It ripens a week earlier than even the earliest dewberries. We confess to dense ignorance of this wonderful fruit, which is described by a California correspondent. It is possible that the mammoth blackberry of California noted on page 550 is the variety meant, though the yield remains incredible. W. V. F.

Baldwin Apples in New England.

I read in THE R. N.-Y. and have seen it copied, that the leaves of the Baldwin apple drop in early Fall. The writer uses this expression concerning western New York: "You will see whole orchards which now hold their leaves until after heavy frosts." Does not this explain the difference in flavor of New England grown apples? Tastes differ, but the best experts we have at our exhibitions place the Baldwin at the head of the list of Winter apples in point of flavor. The Rhode Island Greening, when well grown, has a delicious richness peculiarly its own, but the preference soon returns to the Baldwin as the apple to set before your friends. Returning to the conditions which are conducive to the perfect ripening of this apple, with its rich subacid flavor, the writer informs us that until spraying was practiced its most essential contributors, namely its leaves, have fallen from the tree prematurely. Is this condition local or widespread? Here in New England all apple trees hold their leaves so late in the Autumn as to make us tired, being about the last tree to shed its foliage.

A very energetic man who is not over strong, said to the writer: "Good health is everything." The question arises, can any fruit be grown to perfection without healthy foliage? That it directly promotes the beauty of flowers and the quality of fruit is self-evident. Strip the leaves from a crimson rose and the blooms on such a branch will be but pale pink, while on the remaining branches they retain their full color. May we not justly infer then that when the Baldwin is grown away from its original home there are climatic reasons why its high character is called in question? J. W. ADAMS.

Massachusetts.

Lime on Strawberries.

I have had no experience with lime. Ashes show no results on our clay loam. On gravel or light land near us good results have been obtained when used in connection with barnyard manures.

Oswego, N. Y. F. J. TICE.

From a very limited experience we believe unleached wood ashes a good fertilizer for strawberries, but from economic reasons we have depended almost exclusively on stable manure for several years past. We have never applied lime to strawberry vines. Our method of fertilizing and growing strawberries will not allow us to throw any light on the benefit to be derived from the use of ashes or lime as a fertilizer for the strawberry crop.

Orange Co., N. Y. W. D. BARNS & SON.

I have never applied lime to land just previous to planting strawberries, nor would I advise it. If the land is sour, or contains too much vegetable matter, forming undesirable acid in it, I would prefer to apply lime the previous year, and grow corn or some other crop (not potatoes). Wood ashes are helpful in many soils for strawberries, the only objection to it is that with us it gives clover, especially White, too much start. The most satisfactory preparation of soil for strawberries with us is to give the soil a heavy dressing of stable manure one year previous to planting the strawberries. If the soil is clay or inclined to be stiff apply at same time 30 to 50 bushels of fine slaked lime. This will put the soil in fine condition for the plants. I would use ashes instead of lime if the soil was of a sandy or loamy nature. It is not safe to plant on land that has lain over one year in sod, it might be infested with the White grub, the larvæ of the June bug. It should be fallowed for two years at least.

Hightstown, N. J. C. BLACK.

KILLING CUCUMBER BEETLE.—Your issue of August 3 shows much loss from Squash borer and stinkbug, as well as Cucumber beetle, so I give my experience. After losing crops of each for years, though I tried tobacco, coal tar on corncobs placed in hills, etc., all proving failures, this year I used two tablespoonfuls of spirits of turpentine mixed thoroughly with one bucket of ground plaster, and with this mixture, while the dew was on plants, I sprinkled the roots, body of plants and each leaf. This I did twice. Result, magnificent growth of rich, dark green vines and bushes, and more squashes and cucumbers than in the past 10 years together. Try it, next year. A. W. SMITH.

Georgia.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

MICA AXLE GREASE
Makes short roads.
And light loads.
Good for everything that runs on wheels.
Sold Everywhere.
Made by STANDARD OIL CO.

SWAN'S STANDARD ROOFING 2 & 3 PLY. TRADE MARK.
Can be applied by anyone on steep or flat roofs.
LOW PRICE! DURABLE! FIRE-PROOF!
If you are going to build, or have leaky shingle or tin roofs, send for sample and circular.
THE A. F. SWAN CO., 114 Nassau Street New York.

RUBEROID
THE POULTRY-HOUSE ROOFING
As a water-proof covering for Poultry-Houses, RUBEROID has no equal. Keeps the houses cool during the warm weather, and warm in Winter, and the chicks dry and comfortable. The sun cannot melt it.
THE STANDARD PAINT CO.,
100 William Street,
NEW YORK.

BALES 15 Tons a Day HAY
The Gem Full-Circle Baler, lightest, strongest, cheapest baler. Made of wrought steel. Operated by 1 or 2 horses. Bales 10 to 15 tons a day. Sold on 5 days trial. Catalogue free. Address
GEO. ERTEL CO., Quincy, Ill.

CIDER MACHINERY
Best and cheapest. Send for catalogue.
BOOMER & BOSCHERT PRESS CO.,
118 Water Street,
SYRACUSE, N. Y.

THE MIETZ & WEISS Kerosene Engines
Cheapest and Safest Power Known. For pumping and electric lighting, grinding corn, separating cream, sawing wood, *and all power purposes.* Send for Catalog.
A. MIETZ,
128 Mott Street, New York.

CHARTER Gasoline Engine
USED Any Place By Any One For Any Purpose
Stationaries, Portables, Engines and Pumps, Hoisters
Send for Illustrated Catalogue and Testimonials. State your Power Needs.
Charter Gas Engine Co., Box 26, Sterling, Ill.

OUR "HANDY MAN" GASOLINE ENGINE works a walking beam pump jack, grinds, shells, cuts feed, separates cream, churns, cuts bone, etc. Easy to disconnect and put on belt. Engine 1½ actual h. p. Easy to learn, easy to operate, most economical. Gasoline supply tank. Engine and all, on one base. Send for our Illustrated catalog.
WEBSTER MANUFACTURING CO.
1097 W. 15th St., Chicago, Ill.

$1.75 per 100 lbs
CHICAGO HOUSE WRECKING CO.
West Thirty-Fifth and Iron Streets, • • • CHICAGO.

Hope Farm Notes

Questions have been coming in at a great rate.

How did you come out selling windfall apples?

Here are the returns for a sample shipment of four barrels:

3 barrels @ $2	$6.00	
1 barrel @ $1.50	1.50	
Total	——	$7.50
Commission	.75	
Freight	.64	
Cartage	.40	
	——	$1.79
Total	——	$5.71

Three were large sugar barrels. On an average the regular-sized barrels have sold at $1.50—netting us $1.09, which we certainly consider a double windfall under the circumstances.

Did you pick them up just as they came?

No, indeed; we sent only the best. The small or badly bruised apples we left for the hogs.

Would it not pay to send the smaller ones?

No, there were many barrels of such trash on the market which could hardly be given away. I cannot see what farmers are thinking of to send such worthless stuff.

What proportion of the apples fell?

At least one-half. The wormy ones gave up their grip first, and the storms blew others. The old trees are headed too high.

What difference does that make?

As they sway in the wind the branches switch hard and throw down more fruit. The apples have farther to fall and are damaged more. I shall head my young trees down low.

How about the hand-picked fruit?

We do not ship them to New York, but sell them to men who pack in baskets and peddle in the nearby towns.

Why do you not peddle them yourself?

The fact is that we have more work on the farm than can properly be done. We cannot spare man and horse. The little boys have tried it with fair success, but peddlers are like poets in one respect—they are not made of common clay. The boys went out with apples to sell and came back reporting that "Everybody wants to *sell* apples!" A born peddler would have avoided such folks and found others who wanted to buy.

But what about the advice we hear so much of urging farmers to peddle more?

Like all other advice, it is not for general application. The man of average size and shape will look fairly well in a readymade suit of clothes. Take a man with three extra inches on his leg, or a well developed alderman's badge, and he must have his clothes made to order, or wear those designed for a larger man. There are some cases where it seems to pay to peddle farm produce, but as we are situated I doubt the wisdom of it.

You speak of work done by the children—is that a joke?

No. I claim that a child should be expected to do some useful work every day. Our children have regular jobs, and I make it a part of my business to see that they are done. It is a shame to overwork a child or to make him think that he must toil and slave simply because he is living. At the same time I know that the habit of useful labor is one of the most needful, comforting and ennobling things that have to do with human life. The child who grows up with a love for apples will drink mighty little liquor, and the child who works from habit will keep out of much mischief.

Do you mean to say that your children love to work?

No; they are as much inclined to shirk as other children, but I hope to show them that the desirable things of this life are to be obtained only through work, and that nothing but labor will give health to brain, heart or muscle. Not one of our children can expect to have any great help financially. They will have to understand from the first that Hope Farm is not a breeding place for rich people, and that all I ever can or will give them is opportunity, ambition and good habits. If I were to become suddenly rich I would not let my family know of it if the knowledge could be honestly kept from them.

Is not that a ridiculous statement?

Some people may consider it so, but it is my conviction that few things do more to dull true ambition and blunt honest self-reliance than the idea of a young man that money "comes easy." On the other hand, when a man has fought his way unaided through poverty and hardship, and has made himself comfortable, I believe the sweat on his honest dollars makes him a better citizen all around.

What have you to say about the second-crop grass?

It appears now that we are to have a good second crop on both the fields where we tried the "Clark" plan. On one field we used muriate of potash and nitrate of soda after mowing, and this has started a heavy growth. The older meadows are full of wild carrot.

Do you mean to say that you let weeds grow at Hope Farm?

Yes, though we gain on them somewhat each year. That is one thing in favor of the "Clark" method of seeding. Where we tried that last year hardly a plant of wild carrot appeared after mowing, while on the adjoining old meadows the fields were white by August 1. We clip them off with the mower and rake and burn, but I have never been able to get rid of this weed without plowing up the sod and giving thorough cultivation. We are alive with weeds this year—it has been impossible to work in some of the crops.

Is it still wet?

There is more or less rain nearly every day. Some days we think we can go through with a clear record when, late in the afternoon, almost without warning, a cloud will suddenly form and turn the hose on us. Then, when the farm is as wet as a ducked hen, the sun will come smiling out and fairly parboil all hands. This sort of thing just suits the weeds so that the corn and the old meadows are alive with them. The potatoes are quite clean. They are on last year's corn ground where the crop was hoed and weeded with great care, and the children went through and pulled all the little weeds out of the hills. Understand, though, that we hope to kill most of these weeds by September, but it will be a big job.

How does your water system work?

Well. One hydrant at the barn was clogged for a time, but otherwise there has been a full supply. We use all told about 300 gallons of water each day, besides what the cows get at the spring. In a very dry season we could dispose of 500 gallons easily. Think what that would mean if it all had to be pumped through a leaky old pump or lifted in a bucket and carried 10 rods to house or barn! Our windmill has kept us well supplied with water, except three times when we emptied the tank to clean or make repairs. As for irrigating with tank and windmill power, I do not believe it is practical.

What do you feed your hogs now?

The sows get cabbage and apples, with a small feed of wheat middlings and corn. The young stock get more grain and all the green stuff they will eat. Five young sows run with the chickens in a large yard. They eat weeds and apples, and pick up cracked corn. The children pick up large quantities of sweet apples—which are excellent for hog food. A boy will work hard at handling apples or other objects which remind him of a baseball, when pulling weeds with half the force will make his head ache.

You speak of idle land which could not be worked on account of wet weather. What will you do with it?

Part will be set in apple trees—probably this Fall. The rest will be seeded to wheat or rye with grass. There is now a heavy growth of foul grass and weeds on this land. This will be clipped off, raked and burned—early in August. Then the ground will be plowed and the stones will be picked. Up to the middle of September we shall probably sow wheat—after that rye. I hope to have a large acreage in grain this Fall.

Why?

I missed it seriously last year by having too much open land. Had I sown grain on all land under crops last year I would have had no idle fields this Spring. I could have let the grain mature. In any event I feel sure that such soil as ours dries quicker in the Spring, and may be worked earlier when there is a living crop on it. It stands to reason that the millions of little plants will help drain and pump the soil dry. Therefore there is every reason for trying to keep soil covered during the Winter with a living crop. Sometimes we cannot do this as we would like, for there are potatoes to dig, corn to cut and other work for September, which will not leave the team free for plowing. August is often a good month for such work. On light land, free from stones, the disk or Cutaway harrows can often be used in fitting land for small grain, but on our tough stony soil the plow must be used. Some farmers advocate seeding rye, wheat and even grass in the standing corn. By reason of the wet season our corn is too weedy this year to attempt that, and it is also too rough since we have been obliged to hill up more or less.

You spoke of having a horse with the colic. What did you do for him?

It was big Frank, who ate too many apples. It was not a bad attack and Charlie took him in time with a dose of cooking soda in water. We now have a case of homeopathic veterinary remedies which we find very useful. They are given through a crooked glass tube easily and quickly. H. W. C.

THE MANAGER'S SHARE.—In regard to the question on page 533, I would say that when the orchardist is a thoroughly practical and professional horticulturist, and takes complete charge of the plant, we have usually rated his services as nearly equal to the capital invested in the business. As your question covers only the first five years of the orchard's life of course a different ratio should be laid down; possibly the one side furnishing about two-thirds or three-fourths of the capital and the partner doing professional work and furnishing remaining capital. It is a hard question to give a very definite answer, and conditions are so different in different localities, but the above is about what in our experience we have found the two parts of the business relatively worth. H. W. MILLER.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, AUGUST 17, 1901.

That Little Envelope,

which you will find in this paper is intended for immediate use. It is arranged conveniently to carry back the name and address of one of your neighbors, with his remittance for subscription for the remainder of this year. There are blanks for the name and address, and you will notice a little pocket at the point of the arrow arranged for carrying coin safely, after the envelope is sealed. We hope you will at least take interest enough in the matter to hand this envelope to one of your neighbors who needs the paper, with a good word for the paper. A better way, however, would be to get his subscription and write his name and address in the blanks yourself. Then put 15 cents coin in the coin pocket of envelope, at point of arrow, put your own name and address on a slip of paper into the envelope, seal and mail under two-cent stamp. If you should get up a club of 10, you need send us only $1 with the 10 names. But be sure to send this one name anyway. The sooner you do it the more your friend will get for his money. Let yours be the first one back. We thank you in advance for the interest that we feel sure every old friend will take in this matter.

*

THE arid regions of the Southwest are held responsible for the hot winds which sear and wither farm crops in sections of Iowa, Nebraska and other parts of the West. If the desert could be made to blossom, through the aid of irrigation, these winds would be greatly lessened in intensity, if not altogether abolished. So say those who are now urging the National Government to give aid in building vast storage reservoirs for the purpose of such irrigation. The influence of vegetation upon climate is not very well understood; there is no doubt, however, that the arid regions are largely responsible for the hot winds, and future generations may live to see them a thing of the past.

*

LAST April D. R. Pease, of Tompkins Co., N. Y., gave his experience with Pear blight. We now have the following note from him:

> I would like to know how much Pear blight there has been in the State this season, and what success has been secured by those who have sprayed for it. We have had none this season, but our trees were washed once and sprayed twice. We have changed our mixture somewhat this year with good results. There is plenty of blight in our section this season where nothing has been done to prevent it.

We would like to have full and complete reports concerning this disease—its extent, treatment, and also whether some varieties are more susceptible to it than others. Knowledge is power. The only way to make reports effective is to concentrate them. Send us the facts about Pear blight. We will try to sift the information thus received.

*

NIAGARA Co., N. Y., is to have a complete system of free rural mail delivery. A few trial routes were started, and proved highly successful. Now the whole county will be served. This means that 30,000 people or 7,000 families, all living outside of cities and villages, will have daily mail service! Niagara is the fifth county in the country to have a complete system. We do not believe that this result would have been possible had it not been for the Niagara County Farmers' Club. That big and lively organization is composed of wideawake and thoughtful farmers. They come together, exchange ideas, sort out a few of the most practical things that farmers need and then call for them. They receive careful attention. The powers that be become the powers that see to it that these things are done. Would that we had just such a club in every county of New York State!

*

THERE are some varieties of wheat better able to resist the attacks of the Hessian fly than others. That is not so surprising when we remember that certain varieties of fruits or vegetables are more nearly immune than others to insects or diseases. As an illustration, THE R. N.-Y. No. 2 potato, with its thick, leathery foliage is not a favorite with Potato beetles when there are thinner-skinned varieties near by. Only a few years since we were assured by scientific men that there was little if any difference in wheat varieties in this respect. Now the evidence seems to be clear that such a difference does exist. It is just such information as this that our scientific friends ought to dig out for us. We are glad that they wait until they know before "talking for publication."

*

THIS is the season when the so-called "lucky" farmer has his innings. The weather conditions have all been against the crops on average soils. In the East rain after rain has soaked the ground, and in the West the drought has parched it. Thus it has been impossible to produce even fair crops, and, as a result, there is barely enough produce in the country to feed the people. We are selling windfall apples for more than first-class fruit will bring in seasons of plenty, and potatoes which in ordinary years would go to the pigs are eagerly called for in the market. Thus it is that a season of crop disaster is often best for the "lucky" farmer. And who is the lucky farmer? Does he really leave things to chance, or does he strive and study so to fit his ground and organize his crops and forces that each year will give him the largest possible yield? Our observation is that as a rule the men who do best in a year like this one also do well when the general conditions are favorable. In other words, those who are struck by luck are those who are always ready with the lightning rod of thorough preparation erected and in good order.

*

THE unimportant question as to whether one naval commander or another is entitled to more credit for the defeat of the Spanish war squadron off Santiago during the late war is to be fought out in an expensive court of inquiry, to the detriment of public business. Judged by the commotion this dispute has occasioned one might think the question involved was vital to the public welfare, but when it is considered that the officers concerned were trained and educated at the expense of the Government, have received a liberal compensation through a lifetime of preparation for just such a contingency, and since were both promoted to a rank that ensures ample pension on retirement, it seems nothing more can be due them. The spectacle of individuals doing fairly well their ordinary duty is not so rare that hysterics need follow. Myriads of workers in every humble walk in life do as well every day without comment or expectation of unusual reward. It would be more creditable and in keeping with modern ideas of civilization to find the public interested in a discussion whether the originator of the Concord grape, or of the Wealthy apple was deserving of the greater honor. These men fought the grimmest of all enemies, poverty and obscurity, with no hope of substantial reward, and left results of permanent National value behind them, but even the names of these unselfish benefactors are known to few who profit by them.

*

THE R. N.-Y. does not believe that Congressman J. W. Wadsworth, of New York, is a fair representative for the American farmer. The position he took on the question of taxing colored oleo is opposed to the desires of the great majority of American dairymen and general farmers. We do not think that he is the right man to head the important committee of agriculture. We have no personal feeling whatever in this matter. Our position is taken simply because the cause of honest butter, and indirectly the cause of honest agriculture, requires a friend and champion in this place of power and honor. In talking with farmers in Mr. Wadsworth's district we have been astonished to see how general the feeling against him is. Yet, surprising as it may seem, thousands of farmers who believe that his action on the Grout bill is a direct injury to their business, voted for him! Why? The answer is usually the half-hearted and despairing statement that "he was sure of such a big majority anyway that it was no use to cast a single vote against him!" He ran far enough behind his ticket to defeat a Congressman in an ordinary district, but the big party margin discouraged many of those who will usually put political friendship above business enmity. Of course the politicians can point to his big majority and call it a grand endorsement, but they know better—that is if, as they pretend, they know what the voters really feel and desire! We understand that thousands of farmers all over the country are writing to Speaker Henderson protesting against Mr. Wadsworth as chairman of the agricultural committee. We hope that there will be a tidal wave of such correspondence.

*

IT has been demonstrated that mosquitoes can convey the malaria germ from one person to another—and prick it in. It is also thought that they are able to help in spreading smallpox. Granting all this, we must still remember that mosquitoes are no more dangerous than they were before we knew so much about them. Such knowledge does not make them live longer or sting harder—it ought to make us put up a better fight against them.

*

PEOPLE hear much about the abandoned farms of New England. Now and then we are told what the soil of these farms can be made to produce. The hay crop described on page 563 is a fair sample of what the hills of western New England are capable of. This beautiful country, fair in its way as any the sun shines upon, healthful and productive, is becoming depopulated, although as a whole the population of the New England States is increasing rapidly. The movement has been away from the farms to the valleys or water powers, where city and village have grown up. Yet there are many who left the farm years ago who find themselves crowded in the busy town. They, with their children, would gladly go back to the hills if they could only take some of the conveniences of the town with them. We believe that the telephone and the trolley will in time reach up into the hills and repopulate the old farms.

*

BREVITIES.

Little Jersey cows is business,
I'll feed them and show no fear,
But the biggest no-count critter
Is the little dairy steer!
Livin' on the fame and record
That his little sister's made,
Struttin' round to claim attention,
When his board bill h'ain't ben paid.
Hoppin' lively as a cricket
Mighty little thought of beef,
Ridin' on their sister's ticket
Otherwise they'd come to grief.
Ain't you seen *men*, though, jes' like 'em?
Lazin' 'round an' crackin' jokes,
Spendin' lots o' time in settin',
Livin' on their wimmin folks?
Great fat fellers, stout an' hearty,
Fit for work; each lazy lout
Lettin' wimmin folks support him—
How I'd like ter roust 'em out,
You jest sign my name unto it;
Print it black ez it appears;
Stout men ez will live on wimmin
Ain't ser good ez dairy steers!

FAD sometimes spells fraud.

RAPE can be sown as late as September 1.

WANTED—Asparagus with an oxhide—to resist the rust.

YES, it often pays to sit down judiciously on the rising son.

THIS country imported 17 bushels of potatoes from Peru last year.

WE advance the suggestion that you take a backward step from temptation.

THE Baldwin apple is at its best in New England. Is any apple really better?

"POTATO pomace" is the residue left in the manufacture of starch from potatoes.

THE man who has to take the gold cure may well suffer from a consciousness of inward gilt.

HAY caps this year indicate that a farmer is getting some of the hayseed out of his hair.

THERE's another hard knot in the world's tough plan, when a woman says "Yes!" to a drinking man.

WE have a subscriber in New Hampshire who keeps 7,000 hens, and is now marketing 2,000 eggs per day.

THE articles on page 574 seem to dispose of the "tramp creamery" story. Very pretty in theory but not practical.

A GOOD thing to do with cow peas this year is to plow them under about September 1, fit the soil well, and seed to grass.

WHAT becomes of the fat in the milk when the cow is worried or uncomfortable? The chances are that it never was there.

"Do more harm than good!" "Catch more friends than enemies!" That is what the entomologists say about moth traps.

WE find this a hard season for fitting the ground for the Clark plan of grass seeding. It is impossible to get into the field with horse and tools.

"CORN on Fall plowing yet looks well mornings; on Spring plowing it is badly wilted, and only partially recovers nights," says Mr. Warner on page 563.

ONE great cause for debilitated poultry is undue confinement at night. By "undue" we mean that they should be, to all practical purposes, the same as if out doors, from early Spring till late Fall. Plenty of air; but no damp floors. A slight draft, when fowls have been overfed and forced, frequently results in colds.

Events of the Week.

DOMESTIC.—Fifty cases of smallpox among Indians are under quarantine at the Flathead Agency in Montana. The disease exists also among the Turtle Mountain Indians, and at some of the Sioux agencies, particularly in the Dakotas, but outside of Flathead the attack is diminishing. Smallpox has again attacked the Winnebago Indians on the reservation near Black River Falls, in Wisconsin, and scattered on private farms between there and Lacrosse, and the extinction of the tribe is threatened. . . . . Governor Davis, of Arkansas, has announced that he will recommend the repeal of the act which permits the public to witness hangings. It is estimated that 10,000 persons attended the execution of a negro at Little Rock, July 26, and there were exhibitions of the side show variety on the ground. Young Lemoyne Jayne, who had seen the hanging, gave an imitation of it, and fatally injured himself. Because of this and the scenes at the execution, Governor Davis has decided to obtain the repeal of the law. . . . . Hundreds of homeseekers at El Reno, O. T., who failed to draw claims in the new Kiowa-Comanche country, are selling their tents, horses and wagons at a sacrifice in order to reach their homes. Many others, who have camped on the borders of the land for months, expecting that it would be opened by a "run," are destitute and already suffering is apparent. Hundreds are drifting south toward the projected towns of Anadarko, Hobart and Lawton, hoping that something may turn up. Many merchants and professional men drew claims, while hundreds of needy have found themselves without either the hoped-for land or money sufficient to purchase necessities. . . . . The Exposition Building at Kansas City, Mo., was destroyed by fire August 5. Ringling's circus was in full swing in the grounds adjoining. The firemen had to drench the main tent, and the sideshow tent was struck to save it after several big holes had been burned in it. Fully 10,000 persons were in the tents and about them, and a panic was narrowly averted. The Exposition Building was built in 1888 and cost over $200,000. It was an enormous affair, built after the Philadelphia Centennial style with a steel and glass roof. It was the largest show building in the West. It was sold and was to have been torn down, so that the actual loss is not very great. There was no insurance. . . . . A gasoline explosion in a grocery store at Philadelphia, Pa., August 5, killed eight persons and injured 40 others. A great deal of damage was done to adjacent buildings. . . . . The vault at the Selby smelter, at Vallejo, Cal., was robbed of gold to the value of $280,000, August 5, by thieves who tunneled under the building and broke in from below. . . . A terrific explosion of nitroglycerin occurred at Bowling Green, O., August 6; one man was blown to atoms, several persons injured, and much property damaged. The explosion was caused by the jolting of a wagon, in which 800 quarts of the stuff were being carried, when crossing a railroad track. . . . . True bills were found by the grand jury, of Bucks Co., Pa., charging John Kinney, manager of the Penn Valley Stock Farm, with the larceny by bailee of 180 horses, valued at $180,000, and the embezziement as agent of $22,000, the property of Sarah D. Cox. . . . . At Scranton, Pa., August 6, the proprietor of an underwear factory was fined $27 for swearing at his employees, and also compelled to apologize to the young women whom he had thus offended.

ADMINISTRATION.—The American consuls in the sections in Central and South America affected by the revolution in Colombia and the war preparations in Venezuela send alarming messages to the State Department. Consul Hezekiah Gudger, at Panama, advised the Department that the state of affairs warranted the dispatch of a war vessel to guard American interests. Owing to the fact that the President expressed displeasure when the State Department sent war vessels to La Guayra during the critical part of the negotiations incident to the war of the asphalt companies, the State Department requires very positive evidence that vessels are needed, before they are sent. The President is opposed to shows of force. The Machias was ordered to Colon August 7.

PHILIPPINES.—A proclamation purporting to come from Malvar, the successor of Aguinaldo, has been issued, giving assurance to the Filipinos of the continuation of active war. American officials at Manila believe it was really written at Hong Kong by Agoncillo. . . . . Secretary Root's order cutting off the use of commissary supplies by civilian employees is causing consternation among the minor clerks, whose expenses are thus doubled. Many of them claim they had an absolute understanding, before leaving the United States, that they would be entitled to use commissary stores. The order became effective August 1. Unless the salaries of the junior employees are raised many resignations are likely to be tendered.

HAWAII.—The constitution of the United States preceded the flag in Hawaii, according to a decision rendered by Circuit Court Judge Gear of the first circuit. He has already released on habeas corpus petitions three prisoners sentenced for infamous crimes after the resolution of annexation was passed by Congress, and was signed by President McKinley, on the ground that they were not convicted by a unanimous verdict of 12 jurors. A wholesale jail delivery of murderers, burglars, larcenists and other criminals is threatened, under the decision, and Honolulu is greatly disturbed over the prospect.

FARM AND GARDEN.—Fifteen carloads of Russian hard wheat arrived in Kansas City, Mo., July 29. Four more carloads are yet to come. There are 14,446 bushels of wheat in the consignment, and it is to be distributed for seed purposes in Kansas and Oklahoma. It is the greatest shipment of hard seed wheat ever brought to this country.

The Dairy and Food Bureau of the Pennsylvania State Department of Agriculture will institute proceedings against oleo manufacturers to obtain a court interpretation of the new law governing the making and sale of the substitute for butter.

The establishment of the Union Provision Company, of Somerset, Pa., was seized by United States officials, August 1. The company was chartered for the purpose of conducting a butter renovating establishment, and is capitalized at $15,000. It is alleged that the concern has been engaged in the illegal manufacture of oleomargarine, samples of the product having been analyzed by the Government officials at Washington.

Anthrax is reported among the cattle in several counties of South Dakota.

The forty-seventh annual fair of the Pennsylvania State Agricultural Society will be held in joint exhibition with the Lancaster County Agricultural Association at Lancaster, Pa., October 1—4; secretary, J. P. Nissley, Hummelstown, Dauphin Co., Pa.

C. O. Townsend and H. P. Gould, who have made enviable records as State pathologist and entomologist respectively in Maryland, are now connected with the United States Department of Agriculture. They are succeeded in Maryland by G. L. Stewart and A. L. Qualntance.

After a thorough inspection of western Nebraska, Gifford Pinchot, chief of the Bureau of Forestry, U. S. Department of Agriculture, and W. L. Hall, expert superintendent of the tree-planting division of the same bureau, believe that the sand hills and prairie can be converted into another such pine woods as northern Michigan. The forestry experts will bespeak the aid of western Congressmen to this end.

As a result of pressure brought to bear on him by the nurserymen of the State, Governor Stanley, of Kansas, may remove E. A. Popenoe, whom he recently appointed State inspector of nurseries. The nurserymen declare that there is no good reason for the appointment of such an official, as no such office existed prior to the time Governor Stanley named the inspector. A. L. Brooke and other Topeka nurserymen called on the Governor July 22 and asked him to remove the inspector. The Governor promised to settle the matter satisfactorily.

The Southern Nurserymen's Association met recently at Asheville, N. C., and elected the following officers: President, J. Van Lindley, Pomona; vice-president, Henry Chase, Huntsville, Ala.; secretary and treasurer, W. L. Wilson, New Chester, Tenn.

The annual convention of the Society of American Florists opened at Buffalo, N. Y., August 6.

CROP PROSPECTS.

The apple crop is very light here, but we will have a nice light crop of our own, which was sprayed fairly well considering the season, and buyers are after them at good figures. We expect to pack in barrels again this year to suit the wholesale men, believing we can do about as well this time selling at picking time. We are hopeful of 1,000 barrels of nice fruit. We have had no dropping since May. We have a good peach crop, too, but the dry weather is hurting it very much. Peach yellows is making a raid on us this year. Several good rains have passed around in sight, but it is dry on the farm. It was wet enough on the road to market.

Bradrick, O. U. T. C.

JULY 29.—The worst drought and hot weather ever known in Illinois was ended in this section yesterday by a fine rain, and we now have prospect of more, which will be thankfully received. Mercury reached 100 degrees and above for a week or more at a stretch. Last Spring some of the best farms sold for $60 to $65 per acre here, which was an advance of about $10 per acre in 10 years. The corn cannot possibly make over half an average crop this year, which will no doubt check the advance in values of lands. Many cash renters will be left in debt. The average yield of butter from 100 pounds of milk has been but 3.6 to 3.7. No Jersey cows. I have paid 15 cents per pound for butter fat, which made the milk from 50 to 60 cents per hundred. Drought cut down milk receipts, so there is nothing in it for anyone. W. S. S.

Pleasant Valley, Ill.

JULY 29.—We have had a wet season here since June 1. Haying weather was very "catchy" before July 4; since then we have had two weeks of good hay weather. Oat harvest has been very bad; it has rained every night for the past week. Hay was a fair crop; wheat very uneven, some pieces being nearly ruined by the Hessian fly, while others near by were not injured at all. Oats are a fair crop. Corn fair on high land, but badly drowned out on low land. Potatoes are not very good on account of too much wet. Bugs have been very bad this year. The apple crop in this part of Michigan is almost a total failure, not enough for home consumption. I was talking with a traveling fruit buyer the other day, and he told me that there were no apples to speak of in western Michigan. Peaches and plums are generally a good crop. Milch cows are doing well; pastures have been good all the season in this locality. The second crop of clover is just booming now.

Ottawa Co., Mich. H. L. W.

JULY 29.—We have had all kinds of weather this season. It was cold and dry until June 15, then we had some light rains with a turn to warmer, but no more rain until July 4, when we had a fairly good shower. Since then dry and hot. Corn was badly rolled; it was the warmest weather I can ever remember here, the thermometer reaching 100 to 109 degrees right along until to-day, when we had a heavy rain. It is almost impossible to work a binder on low land at the present time. Corn made such a poor growth that I nearly gave up having any, but the hot weather set it booming; it is tasseling out and setting for ears in fine shape, and promises a big crop. Potatoes will yield a good crop where the bugs have not eaten them up, but they have ruined a large part of the acreage. They did not come out of the ground until the late potatoes were up, and then the air was full of them; the hot weather was a picnic for them. We have never had bugs so thick before; one week would hatch and grow a full-sized slug, and we have not done with them yet. Cultivating, haying and harvesting all came at once. Wheat is a fair crop, the best we have had in three years, and is nearly all in the stack. Rye a good crop, all cut, but is in the shock yet and sprouting some, with no signs of a chance to draw it. Hay was about one-third of a crop, generally secured in good condition. Oats are the poorest in years; so short that it is impossible to cut some of them. I see Mr. Garfield in THE R. N.-Y. estimates the apple crop of Michigan at about one-half an average, and I think he is putting it far too high. No section I have been in has nearly a half crop, and a good part of the country has none at all. They are scarce here, Harvest apples selling for 75 cents per bushel, and they are mighty small. Early potatoes are rotting badly since the rains commenced. W. B.

Mecosta Co., Mich.

JULY 31.—The outlook for apples is poor. Hay a good crop; corn looking well. Early potatoes poor; late ones give a fair showing for a good yield. Oats very poor; grasshoppers are eating the heads off. Some pieces of buckwheat are entirely destroyed. Wheat is a fair crop; it has been very hot here, but we have had plenty of rain lately. Most farmers have done haying. A great deal of rye has been harvested here this year.

Gillett, Pa.

AUGUST 1.—The apple crop in this section of the State will not average more than from 10 to 25 per cent of an average crop. Some orchards are almost entirely destitute of fruit, while others only give promise of a very moderate crop. Tent caterpillars did but little damage in this vicinity, but canker worms have done some damage where no spraying was done. The hay crop has been nearly all gathered in, and a full crop has been harvested. Barns are well filled as compared with the past two years. Grain is fairly good, while corn is growing finely. A fine rain July 28 and July 30 came as a benediction to the farmer whose crops were getting a little dry. There is some complaint that the potato yield will be light hereabouts. T. D. S.

Madison, Me.

AUGUST 6.—This is not a very good section of country for wheat. Most of the wheat raised here is Fultz, some white wheat, or the Red Chaff Mediterranean. The early seeded wheat suffered from the fly most, while the late seeded was practically free from it. No difference noticed in the varieties of wheat. E. T.

Elkins, W. Va.

AUGUST 5.—Since you published my report of June conditions have changed the prospect for a fair apple crop greatly. Insects and scab have got in their work, with the drought following. I now believe one-third will be a good estimate of the crop here. East and northeast of here 30 to 40 miles will be even less. Peaches set a very heavy crop, but will be poor; as very few growers thin, rot and premature ripening have set in Most varieties of plums are rotting very badly on the trees. Japans are a good crop, Abundance is ripening. Hay and wheat have been stored; cutting oats is in order. There will be a light crop. With a little rain corn will be a fair crop. Potatoes looking very poor.

Ogle, Pa. G. W. H.

Government Weekly Report.

Lower temperature and good rains in the Missouri Valley have materially improved conditions, yet the drought is only partly broken in the section east of the Mississippi and north of the Ohio River. Texas is also badly in need of rain. New England, the Middle Atlantic States and the Pacific coast have had a generally favorable week. In the corn belt late corn looks decidedly better, and reports would indicate that more than usual was planted late this season. In the Middle Atlantic States a fine corn crop is promised. In the Spring wheat section weather has been favorable for harvesting, and the work is completed in all except the extreme northern districts. The oat harvest is nearly finished, and the yield generally unsatisfactory. The prospect for apples is slim. In sections where a fair quantity of fruit set, it has been damaged by the extreme heat. Fall plowing is in progress in the Missouri Valley and Atlantic States.

Facts About the Hessian Fly.

Bulletin 194, just issued from Cornell University (Ithaca, N. Y.) gives a careful statement of the situation as regards the Hessian fly in wheat. It is said that for the past five years the average wheat crop in New York State has exceeded 7,000,000 bushels, while this year the fly has caused a loss of more than half of this amount, or a loss of $3,000,000! Experiments at Cornell and on other farms in various parts of the State show that the variety known as Dawson's Golden Chaff has usually produced a full crop in spite of the ravages of the fly. The Dawson is a strong, vigorous variety with stiff, heavy straw. "It is a white-chaff, bald wheat. The grain is so light an amber that it is sometimes classed as white. Heads rather short, but very compact, and it yields beyond its appearance when standing." Five other wheats appear to be able to resist the attacks of the fly. These are called Prosperity, "No. 8," Democrat, Red Russian and White Chaff Mediterranean, but none of them is equal to the Dawson. Reports from Canada, where the Dawson originated, indicate that the fly attacked it seriously, but in New York State it was nearly or quite insect proof. No one can tell just why this variety was able to resist the insects, though its vigorous growth was probably the chief reason. Prof. Roberts suggests a trial of these varieties, and he wants the names of farmers who are willing to receive a peck or half bushel from the Station. The life history of the insect has now been well studied. The dry Augusts of the past few years have favored its development. Should there be a fair amount of rainfall in August this year it is quite likely that the late-sown wheat will escape. While it is not possible to set any date for seeding to wheat in New York it is thought that the best results will be obtained by waiting until after September 20 or 25. Rich ground which will stimulate a quick and strong growth is desirable, and many farmers begin to argue that a fair dressing of fertilizer at the time of seeding will help. The fertilizer does not directly kill the fly, as some farmers seem to believe, but it stimulates the wheat plant so that it makes a quick, vigorous growth. It will pay farmers to send for this interesting bulletin and study it carefully.

PAPER FRUIT BASKETS.—We used the paper strawberry baskets more or less for several years, but have discarded them now. Though they were good in some respects they were inferior in others. It took time to set them up; and some of the pickers would tear them in putting together. They could not be nested, so were inconvenient to carry under shelter at night, or when showers came up. Though they were "gift baskets" some would return them, and the pickers found they were stretched, so it took more berries to fill them. They were not stiff as wooden baskets, so bothered the pickers in getting from the stands (when full of berries) to crates. We now get the wooden gift baskets.

Cavendish, N. Y. L. A. K.

Woman and Home

From Day to Day.

Takin' things easy—that's the trick
That's hardest of all to learn;
This world keeps steppin' along so quick
An' dodgin' at every turn
That we close our ears to the lazy song
That Summer is singin' the whole day long,
An' we get to thinkin' it's wholly wrong
To be takin' things easy.

Takin' things easy, with duty done,
An' never a thought of fear
When the shadows close at the set of sun
An' the moon an' the stars draw near—
The real reward that man kin claim
In the search fer wisdom an' wealth an' fame
Is the chance, some time, without risk of blame,
To be takin' things easy.
—Washington Star.

*

CHEAP little whisk brooms are very useful about the kitchen. One should always be kept for no other use than sprinkling clothes; others for cleaning. There is nothing better than the whisk broom to clean a horseradish grater. The useful chain dishcloth is now much improved from its first estate, being mounted upon a firm handle, which enables it to be used with greater ease. As a pot scraper, however, nothing else equals the humble clam shell.

*

A USEFUL undergarment at all seasons, but especially in early Fall, when sudden chilly days come, is a woven underwaist which comes in cotton, thread or wool. It has a high neck and long sleeves, fits like a glove, has but little bulk, and is a very useful extra garment, when additional warmth is required. Many women wear the woven underwaist in place of an ordinary muslin corset cover, during the Winter.

*

BARLEY water, which in our youthful mind was usually associated with measles, hard colds, and similar afflictions, is now frequently served as a luncheon drink, though it is more popular in England than here. Very thin, well iced, and flavored with lemon, it is decidedly refreshing. To make it, put a heaping tablespoonful of barley into an earthen bowl, and cover with two or three quarts of boiling water; allow it to stand until cold, drain off, and add lemon juice and sugar to taste. Grated nutmeg is also used by some. Currant water is another refreshing drink that is easily prepared. Simmer a pint of the fruit in a quart of water sweetened with a tablespoonful of powdered sugar. Cool and strain, and serve with cracked ice, a slice of lemon, and a few fresh currants.

*

MASCULINE critics often assert that many a woman conspicuous for great virtues obscures them all by the small faults that do much to create friction in family and social life. She will work herself to a shadow for those she loves, and then turn her well-cooked meal to apples of Sodom by her complaining tongue. She will deny herself some longed-for pleasure for the sake of her church, and then quarrel with a well-meaning sister because of a fancied lack of recognition at the sewing society. It is a spirit which makes misery in the home and carping unfriendliness abroad; which turns love's duty into bondage, and renders friendship an irksome burden. We all know such women—women whose virtues are all qualified with one little "if." If such a woman could only realize that she owes, both to her own household and to the stranger within her gates, not merely the work of her hands, but also that most excellent gift of charity, which includes all the finer graces of mind and heart! If sweet serenity and cheerful patience seem foreign to her nature, she may at least assume these virtues, though she has them not. A martyr is not a very cheerful companion unless, like Saint Perpetua, she can wreath her martyrdom with roses.

*

A NEW JERSEY reader asks us to repeat the recipe for canning small cucumber pickles, given in THE R. N.-Y. last year. She says that she tested this recipe and can vouch for its excellence. It is as follows: Wash the little cucumbers, rubbing off the prickly points. Cut the stem when gathering; do not pull out, as that is likely to break a piece out of the fruit. Leave the stem about

Infant's Coat and Cap.
3885 one size

half an inch long. Pack the cucumbers into a two-quart glass jar, put a large spoonful of salt on top, shake it down, fill the jar with cold water, screw on the cover, and set away for 24 hours. Then pour off the brine, fill the jar with cold vinegar, screw the top on tight and put away in the cellar. In October or November, if the vinegar looks white at the top, pour a little off and replace with fresh.

*

AT this season grass stains are a frequent annoyance on the children's clothes, being often unaffected by ordinary washing. They will dissolve in alcohol, however, and, if used immediately, ammonia and water will often wash them out. Where the color of the fabric may be affected, it is said that molasses, or a paste made of soap and cooking soda, may be spread over the stain, and left for several hours, or the stain may be kept moist in the sunshine until it begins to turn brown, and then washed out. Fruit stains, which are among the Summer trials of the housekeeper, should always be treated while fresh, or they may become indelible. An old method is still the best one for their removal; stretch the stained part over an earthen dish, and pour boiling water upon the stain until it disappears. When the stain is old and set, acid or Javelle water may be needed to stir it.

The Rural Patterns.

In spite of fashion's changes, an infant's wardrobe remains much the same, the long cloak and cap being essential. The pretty little models given are adapted to all seasons and to a variety of materials. In the original the coat is of cream Bedford cord with silk embroidered frill, the cap of white India silk with bands of embroidery worked on the same material, but cashmere, China silk, ribbed silk and poplin can all be used for the coat; and the cap can be made of swiss, batiste or any similar material, with embroidery or lace as preferred. The coat is made with a yoke body, from which falls the full long skirt, and bishop sleeves with straight bands at the wrists. As shown, it includes both the deep cape and hood and is finished with a turn-over collar, but the hood can be omitted if desired. The cap includes a small round crown and head portion and is trimmed with quillings and held by means of ribbon ties. To cut this coat, 2⅝ yards of material 44 inches wide will be required, with or without hood, 5⅝ yards 21 inches wide with hood, 5½ yards without; to cut the cap, ¼ yard in any width with 1½ yard of ruffling. The pattern No. 3885 is cut in one size only; price 10 cents from this office.

The graduated circular flounce gains in popularity as the season advances, and has the merit of being singularly graceful as well as smart. The admirable skirt shown is shaped with five gores and fits with perfect smoothness over the hips, while it flares freely at the lower portion. The two flounces include just the amount of fullness required by fashion. The original is made of embroidered pongee, but all the season's materials are suitable. Thin goods, such as mohair swiss, dotted swiss and grass linen are charming when so made and hung over a separate foundation, while both silks and wool are well adapted to the style. The skirt is cut full length and can be used plain or with a single flounce when desired. To cut this skirt for a woman of medium size, 10⅝ yards of material 21 inches wide, 10¼ yards 27 inches wide, 9¼ yards 32 inches wide, or six yards 44 inches wide, will be required. The pattern No. 3881 is cut in sizes for a 22, 24, 26, 28 and 30-inch waist measure; price 10 cents from this office.

Warm Weather Comfort.

The two things that add most to our comfort at this season are shade trees and ice; and yet comparatively few farm homes are well supplied with both. The lack of these things is perhaps felt most keenly by the busy housewife, much of whose time is spent in the heated kitchen, and whose afternoon nap (should she find time for such a luxury) is taken in a darkened bedroom. What wonder that under such conditions, the farmer's wife grows nervous and irritable, and shudders at the thought of such a life for her daughters? The farmer lives in the open air, according to nature's laws; and too often his wife's life is quite the reverse. This is both wrong and unnecessary. With plenty of shade, much of the so-called housework may be done in the open air; and ice cream and sherbet may take the

3881 Woman's Five-gored Skirt
22 to 32 waist.

place of puddings and pies, greatly to the enjoyment of the entire family. Every farmer's wife should insist upon having these things for her comfort, and her husband will thank her for it. Often the things that require most persuasion before the head of the house attends to them, are the very things he takes most pride in, once they are done.

We have found that a shed on the north side of a building, boarded high enough to prevent the sun shining in, but allowing a free circulation of air beneath the roof, makes an excellent ice house, also that snow between the blocks is preferable to sawdust. When we built our new house a few years ago, we were cautioned not to set shade trees too thickly, lest in a short time the lawn should present a cluttered appearance, but from our own experience, we have decided that the better way is to set plenty of trees, and whenever one is noted a nuisance, cut it down. It is easy to decide now, where shade trees are most needed, and quite as easy to forget all about it, when the time for planting arrives. It is not so much from lack of time as lack of thought that these things are so often neglected, for do we not find time for National holidays, excursions, fairs and so forth? I do not think I am lacking in patriotism when I suggest that decorating our grounds with native American trees, shrubs and vines would be a pleasant and profitable way of observing Decoration Day, and that gathering up unsightly rubbish for a big bonfire would be a commendable manner of celebrating the Glorious Fourth. The birthdays of the Father of his Country and the Great Emancipator both occur at just the proper time for packing ice, and if thus employed, we should eat and drink to their memory oftener than we ever have done. We all wish our children to feel that "there's no place like home," and the best way we have ever found for impressing this upon their minds is to have some truth in it. Too many grown people, as well as children, seem to think that good times are not to be had at home; and that to celebrate any holiday, one must necessarily go somewhere, and indeed many homes present such a cheerless aspect that we do not wonder that this feeling prevails.

On a certain country road are two homesteads, which no one can pass without being struck by the contrast between them. The first has a large, handsome, modern house that would do credit to a city street, but the grounds surrounding it are rough, uneven and overrun with weeds. The blinds are closed, and a stranger might imagine the place uninhabited. This, however, is not the case. There are no shade trees or vines to subdue the burning heat of the Summer sun; and as the front rooms are seldom used, naturally the blinds are very rarely opened. To see this beautiful house, surrounded by nature's waste, is a sight to make an angel weep. I am told that the owner went beyond his means in building, and has been "hard up" ever since. The next house is small and plain, but has broad vine-covered piazzas, and is surrounded by beautiful shade trees and a well-kept lawn. The piazzas are furnished with homemade lounges, with plenty of plain cotton-covered pillows, wall pockets for newspapers and magazines, and small inexpensive stands. In shady places on the lawn are comfortable seats, and a plain table with white oilcloth-covered top. Under the trees hang hammocks and swing chairs, made of smooth painted barrel staves. These are very comfortable, and almost indestructible. With a gasoline range on the back porch, this family practically lives out of doors during the hot weather; thereby saving much scrubbing, sweeping and dusting. I always think of this place as an ideal home, and such a home is within the reach of every farmer's family; but shade trees are not grown in a single year; therefore the sooner they are set the better.

MARION LAWRENCE.

SCHOOLS, gymnasia, bathing-houses, recreation-piers, libraries, model tenements, better food, ventilation, improved sanitary conditions, and the like, are all of value in their place; but that which makes men and women for God and humanity, and the better service of their land and age, is first of all the personal touch of some strong and tender hand in the home. "God setteth the solitary in families," wrote the Psalmist long ago. Let us respect His order and follow His way. "Home, Sweet Home" is said to have been written by a lifelong wanderer who never had one. It is an immortal witness to the deep and inextinguishable hunger of the human heart.—Bishop Potter.

Aunt Belle's Vacation School.

"The children are coming for the Summer," said Mrs. Burke, without opening the three letters her daughter threw in her lap. "Grandchildren are dear little things, but somehow I should enjoy one Summer without them. I suppose I am getting old, but they are so noisy and troublesome. They are just turned loose from school, and have plenty of time to hunt up mischief."

"I'll take care of the infants this Summer," said Belle, her youngest daughter. "I was away during two of their visits, so it is only fair that I should relieve the rest of you this time."

"I feel sorry for the children, but maybe they will be worn out by Fall, and their parents can't send them another year. Belle always has a lot of theories to try on some one, so this time the boys and girls will get the benefit of them," said Belle's sister Mary.

Bright and early the following Tuesday, seven boys and girls, ranging from seven to 10 years old, the children of two absent brothers and one sister, arrived at the farm laden with baggage and instructions. True to her word, Aunt Belle, who was a charming young woman, with, as her sister expressed it, a head full of theories, took charge at once, and soon had her flock busy. She allowed several days for a general inspection of the premises, and the calves, pigs and colts that had arrived since last Summer, and then gathered them under the big elm tree for her vacation school. The sessions of this unique little school lasted from eight till 10 in the morning and from four in the afternoon till six. The novelty of it pleased the youngsters, who never knew what was coming, nor where school would be held, though Friday was always "letter day," and most of the time the school was under the elm tree. There were lessons in sewing and cooking for the little girls, while the boys made clay figures wonderful to see; lessons in nature study with the help of a small microscope, and lessons in everything else a bright girl could think of. The children were no trouble to anyone but Belle, and they were so much improved in every way simply because kept busy, that they suffered less from heat and bad temper than ever before. The letters to their parents and little friends on letter day were filled with glowing accounts of school, fishing, picnics and haying, but the children never suspected when Aunt Belle advised and corrected that they were having valuable lessons in composition and punctuation. While they sewed and whittled, Aunt Belle read fairy stories, Indian legends and stirring historical tales to them.

To their intense delight several squirrels became tame enough to come under the tree for nuts, and many a happy hour was spent studying their habits. Not a single bird's nest was robbed, though many were discovered and looked into. A little intelligent teaching convinced the children that life and liberty belonged to every creature, unless destructive and dangerous. In former years eternal vigilance on the part of the grown-up people was all that saved the birds and rabbits from destruction. Aunt Belle displayed her scholars on all occasions with pardonable pride, and three of a neighbor's children were added to the flock before the Summer was half over. The parents came to spend a few weeks before taking the children home in the Fall, and under the big elm tree Aunt Belle and her pupils gave an exhibition of work. It was a charming picture, for the little ones, in pretty Summer clothes, told about the collection of pressed wild flowers, the butterfly stories, the sand maps and the cocoons. The little girls had a table with dainty hemstitched handkerchiefs, pin cushions, table mats and doll clothes all made in the simplest possible manner, but showing neat little stitches. The boys displayed tops, pin wheels and doll furniture which would have done credit to older fingers. All these things the children proudly said were to be given to a city hospital for the benefit of the little patients at Christmas.

"Belle, you are a genius," said her brother-in-law. "I would advise you to take up kindergarten work."

"I have been thinking of it," answered that young lady. "Billy Morris, the cashier at the bank, says he never had a kindergarten education and is anxious for me to begin on him. I think his term will start next June."

HILDA RICHMOND.

Okra and Its Cooking.

A great many northern cooks know nothing of okra or gumbo. The liking for it is usually an acquired taste, for it is rather suggestive, to the uninitiated, of green baize stewed in mucilage. However, it is okra that gives the delicious flavor to Brunswick stew, and it always seems to combine well with tomatoes. The dried okra is obtainable during Winter. It is sliced in rings and evaporated like apples. The very small, tender pods may be canned whole. When dried it must soak in water for an hour before cooking and then boil in salted water until tender, which will require about 20 minutes. Okra may be dried at home with very little trouble. Cut the pods in rings, string these on cords and hang them where they will dry quickly.

Stewed Okra.—Take young and tender pods, cut off each end and wash them thoroughly, boil them in salted water until tender (about three-quarters of an hour), then drain off the water; season with salt, pepper and butter and serve in a covered vegetable dish.

Brunswick Stew.—Stew a large fowl until the meat leaves the bone; remove skin, gristle and bones and chop the meat in coarse pieces. Return to the liquor; add a pint of corn scraped from the ears, a pint of young Lima beans, three cupfuls of tomato, a good sized onion, minced fine, a pint of young okras, a small red pepper, minced, a little celery seed, two tablespoonfuls of butter and salt, pepper and Worcestershire sauce to taste. Simmer until okra is tender and then serve. The addition of a little paprika just before the stew is taken up improves it greatly.

Okra Gumbo Soup.—Cut two quarts of okra into rings and add two quarts of tomatoes and three quarts of water; put over the fire and let it boil; take a young tender chicken, joint it and fry a nice brown; put it into the okra and tomatoes; make a brown sauce with the fat remaining in the pan and add to the soup. Add three small onions, chopped fine, a cupful of corn and cupful of Lima beans, and salt and pepper to taste. Let it simmer gently for several hours. When this soup is served a tablespoonful of boiled rice and a tablespoonful of sweet green pepper, cut fine, is put into each soup plate. The Creole cook usually adds gumbo fillet powder, made from dried sassafras leaves.

Okra and Tomato.—Trim the tender pods same as for stewing; cover one quart with salted water, add a slice of bacon and cook until nearly tender. Then drain and add one cupful of tomato and one cupful of brown sauce; salt and pepper to taste and simmer until okra is done.

Okra with Rice.—Prepare one quart of okra as for stewing; put in a saucepan with a pint of tomato pulp, half a pound of ham or lean bacon cut into cubes, a small onion and a red pepper chopped fine and a pint of good broth or stock. Simmer gently for half an hour. Just before serving add a tablespoonful of gumbo fillet powder; let it boil up once and serve with boiled rice. The rice may be heaped in the center of the dish.

Okra, Creole Style.—Wash, trim and cut into slices a quart of young, tender okra; place in a granite saucepan two teaspoonfuls of butter, a medium-sized onion, a medium-sized green pepper, both minced fine; stir over the fire until a golden brown, then add three large tomatoes peeled and cut into pieces, three tablespoonfuls of Spanish or some hot pepper sauce and salt to taste, and the okra. Cover the saucepan and simmer gently for half an hour. Turn out on a hot dish and sprinkle over with a teaspoonful of minced parsley and serve.

Rejuvenated Bread.

My better three-quarters reminds me that I have several times threatened to tell THE R. N.-Y. folks about her rejuvenated bread. This is stale bread—the last of the baking—made palatable again and as good as new, or even better than new, by wetting the old loaf with cold water, putting in the pan and rebaking it in the oven 20 to 45 minutes. It will, if originally good, come out moist and fit to set before a queen. An old black Fanny, a cook from Virginia, gave us this information years ago, and we think it possible that this way of making left overs go down acceptably may not be as well known as it should.

The Hope Farm man, always interesting on all topics, touches lightly on pork and potatoes, the mainstay of the farmers as all-year-'round provender. Well, I just wish I had a big chunk of sweet cornfed country-raised and country-cured boiled pork this blessed minute, with at least five fair-sized potatoes, freshly dug and cooked in their jackets. I could stow them away without discomfort, and finish off with a quarter of a fat cherry pie drowned in Julia's or any other cow's cream or milk, or a big saucer of berries smothered in powdered sugar and milk. Not much dyspepsia, as yet, you see, clings to this robust child of 50 Summers! By the way, we discover that milk and fruit do not fight when eaten together with plenty of sugar; when frequently the fruit (strawberries noticeably so) when eaten without "the trimmings" causes distressing skin irritation, sometimes amounting to hives. We farmers should have on our tables the best of everything; all sorts of vegetables in profusion, including asparagus, rhubarb, etc., and all the fruits that we can grow. Fruit too long has been a luxury enjoyed more exclusively by the rich. Trees and small fruit plants are cheap enough. Let us plant them and eat the fruit thereof, and in the abundance that shall bless us we shall be richer than the millionaire. J. Y. P.

With the Procession.

Knowledge dwells
In heads replete with thoughts of other men;
Wisdom in minds attentive to their own.
Knowledge, a rude unprofitable mass,
The mere material with which wisdom builds,
Till smoothed and squared, and fitted to its place,
Does but encumber where it seems to enrich.
Knowledge is proud that he has learned so much;
Wisdom is humble that he knows no more.
—William Cowper.

PATIENCE is the key of content.—Mohammed.

KINDNESS gives birth to kindness, and love to love.—Mme. Necker.

INCREDULITY robs us of many pleasures, and gives us nothing in return.—J R. Lowell.

GREATNESS is to take the common things of life and walk truly among them.—Olive Schreiner.

BEAR your own burdens first; after that try to help carry those of other people.—George Washington.

IT is almost as presumptuous to think you can do nothing as to think you can do everything.—Phillips Brooks.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

WHAT an absurd thing it is to pass over all the valuable parts of a man, and fix all our attention on his infirmities!—Addison.

I HAVE come to the conclusion that it is good to work hard; it makes one enjoy food and play and sleep so keenly. George Du Maurier.

THINK of your own faults the first part of the night, when you are awake, and of the faults of others the latter part of the night, when you are asleep. —Chinese proverb.

WHAT is meant by our neighbor we cannot doubt; it is every one with whom we are brought into contact, whosoever it be, whom we have any means of helping.—Dean Stanley.

LEARN to laugh. A good laugh is better than medicine. Learn to tell a story. A well-told story is as welcome as a sunbeam in a sick room. Learn to keep your own troubles to yourself. The world is too busy to care for your ills and sorrows. Learn to do something for others. Even if you are a bedridden invalid there is always something that you can do to make others happier, and that is the surest way to attain happiness for yourself.—Boston Beacon.

"I say to thee, do thou repeat,
To the first man thou mayest meet
In field or lane or open street,
That he, and we, and all men move
Under a canopy of love
As broad as the blue sky above.

"And ere thou leave him, say thou this
Yet one word more, They only miss
The winning of that final bliss
Who will not count it true that love,
Blessing, not cursing, rules above,
And that in it we all live and move."

"A smile, a word, a touch,
And each is easily given;
Yet either may win
A soul from sin,
Or smooth the way to heaven.
A smile may lighten the failing heart,
A word may soften pain's keenest smart,
A touch may lead us from sin apart—
How easily either is given!"

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

Rag Carpet—Don't have cold, unsightly rooms and hallways, when we sell new rag carpet, 36 inches wide, 25 cents a Yard. Sample Free. Franklin Supply Co., 718 Race St., Phila.

No More Spoiled Fruit.
Canning made easy and sure by using my Standard Patent Self-Melting, Self-Sealing Wax Strings. Very economical and easy to apply. Valuable fruit information, and 100 Strings by mail, for 45 cents in stamps. C. C. FOUTZ, Middletown, Ohio.

The University of Notre Dame,
NOTRE DAME, INDIANA.
Classics, Letters, conomics and History, Journalism, Art, Science, Pharmacy. Law, Civil, Mechanical and Electrical Engineering, Architecture.
Thorough Preparatory and Commercial Courses. Ecclesiastical students at special rates.
Rooms Free. Junior or Senior Year, Collegiate Courses. Rooms to Rent, moderate charge.
St. Edward's Hall, for boys under 13.
The 58th Year will open September 10, 1901. Catalogue Free. Address
REV. A. MORRISSEY, C. S. C., President.

ST. MARY'S ACADEMY
NOTRE DAME, INDIANA.
(One mile west of the University of Notre Dame.)
Conducted by the Sisters of the Holy Cross. Chartered 1855. Thorough English and Classical education. Regular Collegiate Degrees.
In Preparatory Department students carefully prepared for Collegiate Course. Physical and Chemical Laboratories well equipped. Conservatory of Music and School of Art. Gymnasium under direction of graduate of Boston Normal School of Gymnastics. Catalogue free. Address
DIRECTRESS OF THE ACADEMY,
St. Mary's Academy, Notre Dame, Ind.

Gold-Shell Rings.

Most people like a nice ring. We show three styles. These are made by drawing a shell of gold over a rod of composition metal. They are better and will wear longer than solid gold rings of a low carat. The retail price would be from 75 cents to $1. We will send one of these rings postpaid as a reward for sending one new subscription at $1. Cut a slip of paper the size of finger and send for size.
